

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Wednesday, February 8, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. This meeting has been called for the purpose of taking up the proposal of Henry Ford which the Secretary of War has submitted to Congress. Mr. Ford's proposal is in writing. He has sent a copy to every Member. I understand, and his secretary has also sent me a telegram stating that he was sending 25 additional copies, so that each member of the committee assuredly will have a copy before him.

If there is no objection, we will print as a part of this hearing the report of the Secretary of War submitted to Congress in House Document No. 167, Sixty-seventh Congress, second session, as follows:

[House Document No. 167. Sixty-seventh Congress, second session.]

WAR DEPARTMENT,
Washington, February 1, 1922.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

SIR: Soon after I assumed the duties of Secretary of War, suggestions were made to me by those interested in the development of the power plant and navigation at Muscle Shoals that I should recommend to Congress that an appropriation be made to complete Dam No. 2 (Wilson Dam). In response to such suggestions I stated that when a proposal was made which would assure the Government a reasonable return on at least the additional money required to complete the project, and an effective use of the development for commercial purposes, I would send it to Congress, as the power to dispose of these plants is vested in that branch of the Government.

On July 8, 1921, in consequence of this statement and of some negotiations with the Chief of Engineers, United States Army, Mr. Henry Ford presented a proposal in writing, in which he offered a fixed annual rental of \$1,200,000 for Dam No. 2 and its power plant and appurtenances, such rental to commence six years after the installation of equipment capable of producing 100,000 horsepower, and a rental of \$200,000 to be paid annually during the first six years of the lease. On proposed Dam No. 3 he offered a fixed annual rental of \$480,000 commencing three years after 80,000 horsepower should be developed, and \$160,000 per annum for the first three years of the lease period. Provision was made for certain upkeep charges and payments to be made toward a sinking fund estimated as sufficient to amortize approximately \$48,000,000 of the cost of the dams. Under this proposal the United States was to undertake the completion of Dam No. 2 and the construction of Dam No. 3. This offer was conditioned upon the United States selling to Mr. Ford nitrate plants No. 1 and No. 2, the Waco quarry and its equipment, and the Gorgas-Warrior steam plant and transmission line and appurtenances, all for the price of \$5,000,000.

The cost of completing the two dams is estimated by the Chief of Engineers to be at this time, in round figures, \$50,000,000. Consequently I did not believe that the proposed rental was an adequate return on the Government's proposed investment, and suggested that Mr. Ford modify his offer so that it would be based upon an annual payment equivalent to a rate of interest on the total cost to the Government of completing the projects. On January 13, 1922, Mr. Ford presented to me a proposed modification of his previous offer, by which he agreed to undertake the construction and completion, at actual cost and without profit, of the work referred to in his offer of July 8, 1921, and when completed and ready for operation he offered to pay the United States as annual rental of the property an amount equal to 4 per cent of the total cost of such construction.

At my suggestion Mr. Ford placed in one instrument his offer as modified, which was signed by him on January 25, 1922, and delivered to me on January 27, and which I have the honor to transmit herewith for such action as Congress may deem appropriate.

In brief, Mr. Ford offers to undertake the completion of Dam No. 2 and the construction of Dam No. 3 according to the Government's plans, for which he shall be

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Wednesday, February 8, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. This meeting has been called for the purpose of taking up the proposal of Henry Ford which the Secretary of War has submitted to Congress. Mr. Ford's proposal is in writing. He has sent a copy to every Member, I understand, and his secretary has also sent me a telegram stating that he was sending 25 additional copies, so that each member of the committee assuredly will have a copy before him.

If there is no objection, we will print as a part of this hearing the report of the Secretary of War submitted to Congress in House Document No. 167, Sixty-seventh Congress, second session, as follows:

[House Document No. 167. Sixty-seventh Congress, second session.]

WAR DEPARTMENT,
Washington, February 1, 1922.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

SIR: Soon after I assumed the duties of Secretary of War, suggestions were made to me by those interested in the development of the power plant and navigation at Muscle Shoals that I should recommend to Congress that an appropriation be made to complete Dam No. 2 (Wilson Dam). In response to such suggestions I stated that when a proposal was made which would assure the Government a reasonable return on at least the additional money required to complete the project, and an effective use of the development for commercial purposes, I would send it to Congress, as the power to dispose of these plants is vested in that branch of the Government.

On July 8, 1921, in consequence of this statement and of some negotiations with the Chief of Engineers, United States Army, Mr. Henry Ford presented a proposal in writing, in which he offered a fixed annual rental of \$1,200,000 for Dam No. 2 and its power plant and appurtenances, such rental to commence six years after the installation of equipment capable of producing 100,000 horsepower, and a rental of \$200,000 to be paid annually during the first six years of the lease. On proposed Dam No. 3 he offered a fixed annual rental of \$480,000 commencing three years after 80,000 horsepower should be developed, and \$160,000 per annum for the first three years of the lease period. Provision was made for certain upkeep charges and payments to be made toward a sinking fund estimated as sufficient to amortize approximately \$48,000,000 of the cost of the dams. Under this proposal the United States was to undertake the completion of Dam No. 2 and the construction of Dam No. 3. This offer was conditioned upon the United States selling to Mr. Ford nitrate plants No. 1 and No. 2, the Waco quarry and its equipment, and the Gorgas-Warrior steam plant and transmission line and appurtenances, all for the price of \$5,000,000.

The cost of completing the two dams is estimated by the Chief of Engineers to be at this time, in round figures, \$50,000,000. Consequently I did not believe that the proposed rental was an adequate return on the Government's proposed investment, and suggested that Mr. Ford modify his offer so that it would be based upon an annual payment equivalent to a rate of interest on the total cost to the Government of completing the projects. On January 13, 1922, Mr. Ford presented to me a proposed modification of his previous offer, by which he agreed to undertake the construction and completion, at actual cost and without profit, of the work referred to in his offer of July 8, 1921, and when completed and ready for operation he offered to pay the United States as annual rental of the property an amount equal to 4 per cent of the total cost of such construction.

At my suggestion Mr. Ford placed in one instrument his offer as modified, which was signed by him on January 25, 1922, and delivered to me on January 27, and which I have the honor to transmit herewith for such action as Congress may deem appropriate.

In brief, Mr. Ford offers to undertake the completion of Dam No. 2 and the construction of Dam No. 3 according to the Government's plans, for which he shall be

reimbursed the actual cost, and to lease the dams and power plants at an annual rental equivalent to 4 per cent of the cost to the Government of completing Dam No. 2 and constructing Dam No. 3 (exclusive of the cost of acquiring lands and flowage rights necessary for Dam No. 3). The rentals at 4 per cent are to commence, respectively, in six years after Dam No. 2 has been completed to the point where equipment for 100,000 horsepower is installed and ready for service, and three years after the equipment to develop 80,000 horsepower is installed and ready for service at Dam No. 3. In the meantime, during the six-year and three-year periods, respectively, he offers to pay upon Dam No. 2 an annual rental of \$200,000 and on Dam No. 3 \$160,000. His offer places upon the United States the responsibility for repair and maintenance of the two dams other than the power houses, which power houses and electrical equipment he agrees to maintain at his own expense in efficient operating condition.

As compensation to the United States for the repair and upkeep of Dam No. 2 and locks, he offers to pay the sum of \$35,000 annually, and of Dam No. 3 and lock, the sum of \$20,000 annually. He also agrees to furnish electricity for operating the locks at each of these dams without charge to the Government, and in addition he agrees to pay the sum of \$23,373 semiannually for the purpose of building up a sinking fund to return to the United States at the end of the lease period a sum of money which he estimates, if invested at 4 per cent, will be approximately \$49,000,000. As a condition of this offer he asks that the United States sell to him nitrate plants Nos. 1 and 2, the Waco quarry, and the Gorgas-Warrior steam plant, with all appurtenances, for the sum of \$5,000,000, payable \$1,000,000 down and the balance in annual installments of \$1,000,000 each, with 5 per cent interest on deferred payments. As a further consideration to the Government he agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds throughout the lease period, and to maintain it in its present state of readiness, or its equivalent, for immediate operation in the manufacture of materials necessary in time of war for the production of explosives. He further agrees that the fertilizer produced at nitrate plant No. 2 shall not be sold at a profit in excess of 8 per cent of the actual annual cost of production thereof, and to turn over to the United States nitrate plant No. 2 whenever it shall be required for the national defense. He likewise asks for a preference in opportunity to purchase or lease the property at the end of the lease period and for the right, for a period not stated, to be supplied with electric power at reasonable rates in an amount equal to his average consumption during the previous 10 years in case the plant is operated and his company does not purchase or lease it. He also states that his proposal must be accepted as a whole and not in part.

In order that you may the more readily understand just what Mr. Ford is proposing to buy and to lease, I shall state briefly what has occurred in connection with Government developments at Muscle Shoals, and the character of the Government-owned property there.

Without going into the preliminary history in connection with the proposals for the development and improvement of the Tennessee River, which might, if necessary, be traced to the year 1827, it is deemed sufficient for present purposes to invite attention to the letter over the signature of the Secretary of War, dated June 28, 1916, and printed as House Document No. 1262, Sixty-fourth Congress, first session, transmitting, with a letter from the Chief of Engineers, reports on preliminary examination and survey of Tennessee River between Browns Island and the railroad bridge below the city of Florence, wherein is contained a full discussion of Dam No. 2, now known as the Wilson Dam, and the proposed Dam No. 3, referred to by Mr. Ford, but as to which no construction work has yet been undertaken. The commencement of construction work on the Dam No. 2 resulted from the authority contained in section 124 of the national defense act of June 3, 1916 (39 Stat., 166, 215), under which the President, in a letter dated February 23, 1918, authorized the construction of said dam, as a result of which allotments have been made at various times amounting to \$17,159,610.42 for its construction. The total expenditures on Dam No. 2 have been \$16,251,038.14; the greater part of the balance unexpended will be required to meet payments on contracts for power machinery for the dam. A large construction camp has been built, a railroad track laid to the site, complete construction plant assembled, and the dam itself approximately 30 per cent completed.

Dam No. 2, when completed, will have a total length of 4,267 feet, of which 2,890 feet is a spillway section, 1,221 feet will be the power-house section, and 156 feet abutments and approaches. The height of the dam above present low water is 95 feet, including crest gates 18 feet in height. The total height from the bottom of the excavation for the foundations to the roadway on top of the dam will be 132 feet. There have been no expenditures on Dam No. 3, which is located 14.7 miles upstream

from Dam No. 2. Dam No. 2, when constructed, will render 14.7 miles of Muscle Shoals navigable, while Dam No. 3 will overflow the remaining portion of the rapids and will improve conditions of navigation for a distance of 63 additional miles. The present estimates of the Engineer Department for the completion of both Dam No. 2 and Dam No. 3 is \$50,000,000. Engineers for Mr. Ford have presented a lower estimate, but Mr. Ford has not seen fit to guarantee the construction for this lower figure.

Situated about 6 miles southwest from Dam No. 2, at Sheffield, Culbert County, Ala., adjacent to the city and along the Tennessee River, is United States nitrate plant No. 1, constructed by the United States during the war under an agreement with the General Chemical Co., approved by the Secretary of War on June 14, 1917, for use of its process, and at a total cost of \$12,887,941.31. The plant was built under the supervision of the Ordnance Department of the Army to produce 22,000 tons of ammonium nitrate per annum, using the direct synthetic ammonia (Haber process) of the General Chemical Co. The details of the process were not sufficiently perfected, however, and the plant proved unsuccessful in a test operation. The construction of the plant was started from an appropriation contained in the national defense act of June 3, 1916, and completed from appropriations made for the national security and defense, armament of fortifications and ordnance service. The total acreage of land embraced within the plant site is approximately 19,000 acres. The plant is now in an idle, stand-by condition, with part of the land leased for farm purposes. The cost of maintenance during the fiscal year 1921 was \$75,506.42.

At Muscle Shoals, Culbert County, Ala., 4 miles northeast of nitrate plant No. 1, and 2 miles distant from Dam No. 2, is located United States nitrate plant No. 2. This plant was constructed under contract with the Air Nitrates Corporation for the production of munitions of war under contract dated and executed June 8, 1918, at a total expense, including Waco quarry, of \$67,555,355.09. The plant was built for an estimated capacity of 110,000 tons of ammonium nitrate per annum, using the cyanamid process of the American Cyanamid Co. The plant was successful in a two-weeks test operation with one-fifth of the plant in use, during which time 1,700 tons of ammonium nitrate were produced, as well as 2,200 tons of cyanamid not converted. The cost of building said plant was paid for out of the appropriations for armament of fortifications and ordnance service. The plant site, not including Waco quarry, embraces 2,306 acres, acquired at a cost of \$237,711. The plant is now in an idle stand-by condition, except the power plant located thereon, which was leased, together with a transmission line, to the Alabama Power Co., under the provisions of the act of July 28, 1892 (27 Stat., 321), by an instrument dated November 17, 1921, but revocable at any time. The cost of maintenance of said plant for the fiscal year 1921, including Waco quarry, was \$201,674.63.

Situated about 20 miles south of plant No. 2 in Franklin County, and 5 miles southeast of Russellville, Ala., is located what is known as Waco quarry, acquired by the United States in connection with the operation of nitrate plant No. 2, embracing an area of 460 acres, acquired at a total cost of \$52,962.88. This quarry has a crushing plant sufficient to produce 2,000 tons of crushed and sized limestone per day. The total cost of said quarry, including buildings and plant, was \$1,179,076.80, included, however, as an element of the total cost of nitrate plant No. 2. The plant is now in an idle stand-by condition and a portion of the land is leased for farm purposes.

Situated about 88 miles southeast of nitrate plant No. 2, in Walker County, Ala., is located what is known as the Government-owned Warrior steam plant at Gorgas, Ala. This plant was constructed under contract with the Alabama Power Co., dated December 1, 1917, on land owned or acquired by the said company. It was built in the vicinity of a coal mine with a view to using coal direct from the mines. It has a capacity of 30,000 kilowatts, and the electric power produced at said plant is carried over a transmission line extending a distance of about 88 miles to nitrate plant No. 2, to furnish power for the operation of said plant. The total cost of the plant was \$4,979,782.33. It was built and paid for from appropriations for armament of fortifications. This property is now being operated as a part of the Alabama Power Co.'s system on a rental basis as provided for in the contract for the construction thereof, and during the calendar year 1921 netted the Government approximately \$75,000.

Some question was raised in my mind as to the binding effect of certain provisions appearing in the contract for the construction of nitrate plant No. 2 by the Air Nitrates Corporation and in the contract for the construction of the Gorgas Warrior steam plant and transmission lines by the Alabama Power Co., which purported to give said companies options to purchase under certain conditions, but I have submitted these questions to the Acting Judge Advocate General who is of the opinion that at the time these contracts were made there was no authority to sell said properties, and hence no authority to give an option for the purchase of same. He holds that as the Constitution vests in Congress the sole power to dispose of and make all needful rules and

regulations regarding the property of the United States, and Congress not having authorized the Secretary of War to sell the same, the plenary power to dispose of such property still rests solely in Congress. The Acting Judge Advocate General has also held that the provision contained in section 124 of the national defense act directing that the plant therein authorized be operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital, is applicable to the plant as a whole and is a restraint upon its sale. This construction if justified, would prevent the lease or rental of the plant for private operation. The solution of the numerous legal questions involved naturally occasioned more or less delay in the consideration of the proposals.

In this connection, I may say that the Air Nitrates Corporation has notified me in writing that it claims the right to exercise the option, which it claims to have under the terms of its construction contract, to purchase nitrate plant No. 2 on as favorable terms as those offered by Mr. Ford for the property, should the United States determine to accept Mr. Ford's offer. The Alabama Power Co. may make a similar claim in regard to the Warrior plant and line.

To briefly summarize Mr. Ford's offer for the above properties, the considerations running to the Government are:

(a) Four (4) per cent on part of the capital necessary to complete the construction of the power projects (no interest is proposed to be paid upon that part of the Government's investment which goes to pay for lands and flowage rights for Dam No. 3, which item is estimated by the engineers to exceed \$2,000,000 in probable cost).

(b) The payment of a sum semiannually into a sinking fund calculated to produce about \$49,000,000 at the end of the lease periods. This payment amounts to \$46,746 annually. In other words, Mr. Ford proposes to pay approximately \$49,000,000 at the end of the lease period provided the Government has been able to invest his payments at 4 per cent per annum.

(c) Mr. Ford proposes to pay \$35,000 a year for the upkeep of Dam No. 2 and its locks, and the sum of \$20,000 a year for the upkeep of Dam No. 3 and its lock. These payments are expected to meet the ordinary upkeep expense with which the Government is charged. Mr. Ford assumes the responsibility for upkeep and repair of the power houses and equipment, so that ultimately such equipment is expected to be turned back to the Government in approximately as good condition as when received.

(d) The proposal requires Mr. Ford's company to operate nitrate plant No. 2 to its approximate present capacity, which is estimated to be a production of 110,000 tons of ammonium nitrate per annum, and to sell such product at a price not to return a net profit in excess "of 8 per cent of the actual annual cost of production."

(e) Mr. Ford's company is to maintain nitrate plant No. 2 in its present state of readiness for immediate operation for the production of explosives, and is to turn it over to the Government, together with such of its personnel as may be required for the national defense.

(f) The Government will be saved the expense of maintaining and operating the present imperfect facilities for navigation at Muscle Shoals, amounting to from \$35,000 to \$85,000 per annum.

There are a number of advantages to the Government in the present proposal that were not apparent in the first offer. Mr. Ford's original proposal of July 8, 1921, contained two paragraphs dealing with the matter of amortization of the cost of construction of the two dams. The first of these paragraphs was numbered 2, and reads as follows:

"At the beginning of the seventh year of the lease period, and annually thereafter, the company will pay to the United States a sum not greater than thirty-nine thousand five hundred thirty-seven dollars (\$39,537) to retire, during the remaining period of ninety-four (94) years, the total cost of the Wilson Dam and its power house, substructures, superstructures, machinery and appliances, including locks, all taken at forty million dollars (\$40,000,000); the sinking fund investments to bear the highest rate of interest obtainable, but not less than four per cent (4 per cent) per annum."

The other paragraph was numbered 7 and reads as follows:

"At the beginning of the fourth (4th) year of the lease period, and annually thereafter, the company will pay to the United States a sum not greater than seven thousand ten dollars (\$7,010), to retire, during the remaining period of ninety-seven (97) years, the total cost of Dam No. 3 and its power house, substructures, superstructures, machinery and appliances, including lock, all taken at eight million dollars (\$8,000,000); the sinking fund investments to bear the highest rate of interest obtainable, but not less than four per cent (4 per cent) per annum."

In the present proposal the subject of amortization is covered in one paragraph, numbered 10, which reads as follows:

"For the purpose of enabling the Government to create and provide a sinking fund to retire the cost of Dam No. 3 at the end of one hundred (100) years, the company will, at the beginning of the fourth (4th) year of the lease period, and semiannually thereafter for the remaining term of the lease, pay to the United States Government, the sum of three thousand five hundred and five dollars (\$3,505); and for the purpose of enabling the Government to create and provide a sinking fund to retire the cost of Dam No. 2 at the end of one hundred (100) years, the company will at the beginning of the seventh (7th) year of the lease period, and semiannually thereafter for the remaining term of the lease, pay to the United States Government the sum of nineteen thousand eight hundred and sixty-eight dollars (\$19,868)."

It will be observed that the provision for amortization in the last proposal is very much more favorable to the United States than it was in the offer of July 8, 1921. By the earlier proposal the maximum amount which the Government could realize from the payments made by Mr. Ford at the end of the lease periods would be not to exceed \$48,000,000 (\$40,000,000 in the case of Dam No. 2 and \$8,000,000 in the case of Dam No. 3). The annual payments were in no case to exceed the amounts stipulated, which are the same in the present proposal as in the former proposal, but the former proposal contemplated a reduction in amount of annual payments to correspond to the excess over 4 per cent interest which might be earned by the sinking fund, whereas under the present proposal the fixed installments for amortization are to be paid regardless of the rate of interest earned by the fund. Therefore, if the United States should be able to invest the money at a higher rate of interest than four (4) per cent, the sinking fund at the end of the lease periods would amount to very much more than \$48,000,000. This may be best shown by the following table:

Amount retired by Mr. Ford's sinking fund at various rates of interest, compounded semiannually.

Account of—	Semi-annual pay-ments.	Life of fund (years).	Amount retired at rate of—				
			4 per cent.	4½ per cent.	4¾ per cent.	5 per cent.	6 per cent.
Dam No. 2.....	\$19,868	94	\$40,919,798	\$48,783,949	\$58,319,359	\$83,718,097	\$176,030,810
Dam No. 3.....	3,505	97	8,152,137	9,786,054	11,780,690	17,150,545	37,103,880
Total.....			49,071,935	58,570,003	70,100,049	100,868,642	213,134,690

NOTE.—Payments are to be made into sinking fund semiannually at the beginning of each semiannual interest period. This sinking (or retirement) fund has nothing to do with Mr. Ford's interest payments, but represents a separate fund to be invested at the highest interest rate obtainable for the purpose of returning to the Government within the least period the largest amount possible, with the above semi-annual payments, consistent with safe investment.

Should the dams be constructed at a cost of not to exceed \$42,000,000, as estimated by Mr. Ford's engineers, there would be left to apply on the investment of the Government heretofore made whatever the amortization payments would produce in excess of the \$42,000,000. If the amortization fund should be invested continuously at 4 per cent there would be at least \$7,000,000 to be thus applied, but should it be invested at a greater rate of interest the amount would be increased, as shown by the table.

The provision for renewal of the lease which was contained in the proposal of July 8, 1921, was numbered 11, and reads as follows:

"At any time prior to the expiration of said lease period of one hundred (100) years the company shall have the right to negotiate with the Government for a renewal of the leases for the two above dams, their power houses, etc. In the event of disagreement as to terms of the renewal, the United States and the company shall each appoint an arbitrator, and these arbitrators shall choose a third. The decision of the arbitration board of three shall be final and binding upon both parties."

The effect of this provision was to bind the United States to a renewal of the lease for 100 years on such terms as should be determined to be just by a board of arbitration. Under the new proposal the renewal clause is contained in paragraph 17, which reads as follows:

"In order that said company may be supplied with electric power and the farmers with fertilizers after the termination of the said 100-year lease, should the United States elect not to operate said power plants but determine to lease or dispose of same, the company shall have the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be agreed upon, If the said leases are not renewed or the property covered thereby is not sold to said

company, its successors or assigns, any operation or disposal thereof shall not deprive the company, its successors or assigns, of the right to be supplied with electric power at reasonable rates and in amount equal to its needs, but not in excess of the average amount used by it annually during the previous 10 years."

This paragraph does not bind the United States to a renewal of the lease and is in no way an attempt to control the policy of Congress beyond the 100-year period of the present lease, except to preserve to Mr. Ford's company "the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be agreed upon." It also attempts to preserve for the company a right to be supplied with electric power, for a period not stated, "at reasonable rates" in the event the power plants are operated or disposed of to some one other than the company.

In Mr. Ford's offer of July 8, 1921, no provision was made, except possibly by inference, as to who should bear the expense of renewals, repairs, and maintenance on the power houses, machinery, and appliances which will be erected and installed in connection with the dams. Paragraphs 4 and 8 of the present proposal impose the obligation upon Mr. Ford's company of making such renewals and repairs and effecting such maintenance at its own expense. These provisions impose upon Mr. Ford a considerable obligation.

Under the first proposal the United States was to undertake the building of the dams and power plants, but under the present offer Mr. Ford's company is to do the construction work in accordance with plans and specifications prepared or approved by the Chief of Engineers.

The proposal of July 8, 1921, contained no provision for a termination of the leases in case of default. Paragraph 18 of the present proposal applies substantially the same provisions to Mr. Ford's proposed leases as are contained in the present water power act.

Paragraph 19 of the present proposal, except the first sentence thereof, had no counterpart in the original proposal of July 8, 1921. The new matter reads as follows:

"Upon acceptance the promises, undertakings, and obligations, shall be binding upon the United States, and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors and assigns; and all the necessary contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned."

Apparently this is an attempt on Mr. Ford's part to express a personal obligation to assure the performance of the contracts which are to be made by the company which he is to organize. It might be contended that this language is susceptible of a construction to the effect that Mr. Ford is personally bound only to see that his company enters into the contracts required to carry out the terms of the proposal, and this point should be cleared up so that there can be no question as to its proper construction. There should be some assurance that the contracts made by the proposed company will be carried out or some penalty imposed for failure to perform.

In the event Mr. Ford's proposal is accepted, the Government must make new appropriations amounting to \$40,000,000 to \$50,000,000, of which Mr. Ford's company will have the benefit for approximately 100 years at 4 per cent. The company is, of course, bound to keep nitrate plant No. 2 in a condition to produce explosives, which, as a matter of preparedness, is of great value to the Government, as, no doubt, a plant fully organized and in production would be available far sooner than one maintained merely in stand-by. Nevertheless, Mr. Ford is offering but \$5,000,000 for the title to the two nitrate plants, the Waco quarry, the Gorgas-Warrior steam plant, transmission lines, and appurtenances. That Congress may the better understand the value of the property for which Mr. Ford is offering this \$5,000,000, I am attaching to this letter, as Exhibit A, a statement prepared by the Chief of Ordnance showing the cost and estimated salvage value of these properties. From the table contained in this statement it will be seen that these properties cost the United States approximately \$35,000,000 and that as scrap they are estimated to be worth \$8,512,000. However, the last column of the table in Exhibit A indicates that the Chief of Ordnance believes the War Department can dispose of the property for \$16,272,000. Mr. Ford is bound by his proposal to operate nitrate plant No. 2, but there is no legal obstacle to prevent his disposing of the other properties to which he gets title.

Should he be able to obtain what the Chief of Ordnance estimates that the Government can secure for the various items, namely, \$3,000,000 for the Warrior plants, which have an installation of 40,000 horsepower, and \$600,000 for nitrate plant No. 1, and dispose of the Warrior-Muscle Shoals transmission line as a transmission line and not as scrap for \$875,000, and should he obtain \$357,000 for the Waco quarry he would have left the nitrate plant No. 2, with its 80,000-horsepower steam plant, at a cost to him of less than \$400,000. The interest on the proceeds of such possible sales would amount to a very large sum during the terms of the proposed contract.

The present revenue from rental of the power plant at nitrate plant No. 2 is a minimum of \$120,000 per annum with a possibility that in event of operation it may run to \$260,000. The cost of maintenance of nitrate plant No. 2 was approximately \$200,000 during the fiscal year 1921. The total horsepower developed by the three steam plants to which Mr. Ford will get title is 125,000, which practically doubles the all-season or primary horsepower to be developed at Dam No. 2 (approximately 500,000 of the horsepower that is to be developed at Dam No. 2 will not be available 365 days in the year).

Inasmuch as I am without authority in law to accept Mr. Ford's offer or dispose of the property as a whole, either by sale or by lease, it is peculiarly the province of Congress to weigh the considerations which will pass to the respective parties to the proposed arrangement and to determine whether or not the advantage to the Government in having nitrate plant No. 2 maintained in readiness for the manufacture of explosives and in actual production of fertilizer, together with the improvement to navigation, is of sufficient importance to justify the proposed departure from the present policy of the law in regard to dealing with the water-power resources of the Nation, and to warrant leasing to Mr. Ford Government property for so long a period at the rental proposed.

If Mr. Ford's proposal be accepted by Congress, I suggest that there should be certain modifications made to safeguard the Government's interest. As heretofore stated, there should be some assurance that the contracts made by his proposed company will be carried out.

I also suggest that the cost of acquiring the lands and flowage rights necessary for Dam No. 3 should be included in the sum upon which Mr. Ford is to pay 4 per cent interest as rent. The omission of the cost of these lands from this computation is more serious than would be the omission of the provision for a sinking fund, for the annual interest of 4 per cent on the cost of such lands and rights, if used for that purpose, would amortize a sum much larger than that provided for in paragraph 10 of Mr. Ford's proposal.

In case the proposed company sells any or all power developed at either or both of these dams, it should be required to do so under terms and conditions imposed by the Federal Power Commission or the Public Service Commission of Alabama, in the manner required of other power companies.

I believe it would be better policy to limit the contract to a term of 50 years to conform to the established policy of the Federal Government as set out in the water-power act. In my opinion a contract such as that proposed for a period of 100 years is not a wise general policy, in view of the unknown possibilities surrounding water-power developments and the probability of changes which may be made, especially in the transmission of power.

While paragraphs 4 and 8 of the present proposal provide that Mr. Ford's company is to pay to the United States annually the sum of \$35,000 on Dam No. 2 and \$20,000 on Dam No. 3 for repairs, maintenance, and operation of the dams, gates, and locks, Congress may well consider whether it would be more desirable to have Mr. Ford maintain the property and omit these payments.

If Mr. Ford's proposal be not accepted, it is my opinion that Dam No. 2 (Wilson Dam) should be completed by the Government, and that the power requirements for commercial purposes, the benefits to navigation, as well as the possible needs of the Government, would warrant this expenditure. If this were done the Government may itself undertake to sell the product to the best advantage. In such case the amount of the Government's present proposed investment would be very materially reduced, because Dam No. 3, costing from \$18,000,000 to \$25,000,000, would not be built. At Dam No. 2 it would not be necessary to make the full installation of power plant until the market should require such installation. This partial installation would effect a saving of present investment in at least the sum of \$3,000,000, leaving, according to the Chief of Engineers' estimate, not to exceed \$22,000,000 to be invested by the Government at this time, instead of \$40,000,000 to \$50,000,000. The analysis made by the Chief of Engineers (hereto attached as Exhibit B) shows a loss in excess of \$15,000,000 due to delay in the receipt of returns from rentals. Such a large loss would hardly be justified in case the investment is to ultimately bear but 4 per cent interest if there were not other considerations which are beneficial both to the Government and the people of that vicinity.

At this time when there is a large amount of unemployment it is not without importance to consider the advantage to the Nation of the employment of the large amount of labor required in undertaking this development. I therefore urge that Congress give early consideration to this matter, not only to settle a controverted question, but to furnish employment on a large scale.

I am attaching hereto the following exhibits which may prove helpful to Congress:

Exhibit A: Proposal of Henry Ford dated July 8, 1921:

Exhibit B: Letter from Henry Ford dated January 11, 1922, modifying the proposal of July 8, 1921;

Exhibit C: Proposal of Henry Ford dated January 25, 1922;

Exhibit D: Memorandum from the Chief of Ordnance;

Exhibit E: Memorandum from the Chief of Engineers;

Exhibit F: Cost statement of Nitrate Plants No. 1 and No. 2 and Warrior-Sheffield Power Station and Transmission line; and

Exhibit G: Memorandum from Maj. John A. Smith, Judge Advocate General's Office.

I shall be glad to place at the disposal of Congress any additional information which it may desire.

Respectfully,

JOHN W. WEEKS, *Secretary of War.*

EXHIBIT A.

DEARBORN, MICH., *July 8, 1921.*

Gen. LANSING H. BEACH,

Chief of Engineers, United States Army, Washington, D. C.

SIR: In response to your advice that the Government invites an offer for the power at the Muscle Shoals Wilson Dam, on my part or on the part of a company to be formed by me (and throughout this proposal to be called the company), I hereby and through you place at the disposal of the President, the Secretary of War, and Congress the following tender:

1. If the United States will promptly resume construction work on the Wilson Dam, and as speedily as possible complete the construction of the dam, and progressively install hydroelectric facilities and equipment for generating 600,000 horsepower, then the company will agree to lease from the United States the Wilson Dam, its power house, and all of its hydroelectric and operating appurtenances, together with all lands and buildings owned by the United States, connected with and adjacent to either end of the Wilson Dam, for a period of one hundred (100) years from the date of the completion of the dam and its power-house facilities; and the company will pay to the United States six (6) per cent on the remaining cost of the locks, the dam, and power-house facilities, taken at twenty million dollars (\$20,000,000), in payments of one million two hundred thousand (\$1,200,000) annually, except that during the first six years of the lease period payments shall begin and be made annually as follows:

Two hundred thousand dollars (\$200,000) one year from the date when 100,000 horsepower is generated and continuously ready for service, and thereafter two hundred thousand dollars (\$200,000) annually at the end of each year for five years. After the first six years payment of one million two hundred thousand dollars (\$1,200,000) shall be made annually, at the end of each calendar year, during the lease period.

2. At the beginning of the seventh year of the lease period, and annually thereafter, the company will pay to the United States a sum not greater than thirty-nine thousand five hundred thirty-seven dollars (\$39,537) to retire, during the remaining period of ninety-four (94) years, the total cost of the Wilson Dam and its power house, substructures, superstructures, machinery and appliances, including locks, all taken at forty million dollars (\$40,000,000); the sinking fund investments to bear the highest rate of interest obtainable, but not less than four per cent (4 per cent) per annum.

3. The company will further agree to pay to the United States thirty-five thousand dollars (\$35,000) annually for repairs, maintenance, and operation of the dam, gates, and locks at Wilson Dam; all repairs, maintenance, and operation of the same to be under the direction, care, and responsibility of the United States during the hundred (100) year period.

4. The company will furnish the United States, free of charge, delivered at a point on the lock grounds designated by the Chief of Engineers, electric power not to exceed two hundred (200) horsepower, for the operation of the locks.

5. If the United States shall accept the above proposal for leasing the Wilson Dam and its power installation, then as a condition of acceptance the company will ask that, immediately upon release of suitable construction equipment and facilities at the Wilson Dam, and upon the release of labor forces, the United States will forthwith proceed to construct and fully complete with reasonable promptness Dam No. 3, as designed and proposed by the United States Engineers, the power installation at Dam No. 3 to be taken in this proposal at two hundred fifty thousand (250,000) horsepower.

6. When the lock, dam, and power house installation at Dam No. 3 are completed, the company offers to lease Dam No. 3, its power house and all of its hydroelectric

and operating appurtenances for a period of one hundred (100) years from the date of the completion of the dam and its power house facilities, and the company will pay to the United States six per cent (6 per cent) on the cost of the dam, lock, and power house facilities, taken at a cost of eight million dollars (\$8,000,000), in payments of four hundred eighty thousand dollars (\$480,000) annually, except that during the first three years of the lease period payments shall begin and be made annually as follows:

One hundred sixty thousand dollars (\$160,000) one (1) year from the date when eighty thousand (80,000) horsepower is generated and continuously ready for service, and thereafter one hundred sixty thousand dollars (\$160,000) annually at the end of each year for two years. If and when, after the first three years, the entire power-house generating equipment of two hundred fifty thousand (250,000) horsepower is continuously ready for service, payments of four hundred eighty thousand dollars (\$480,000) shall be made annually at the end of each calendar year during the remaining ninety-seven (97) years of the lease period.

7. At the beginning of the fourth (4th) year of the lease period, and annually thereafter, the company will pay to the United States a sum not greater than seven thousand and ten dollars (\$7,010), to retire during the remaining period of ninety-seven (97) years the total cost of Dam No. 3 and its power house, substructures, superstructures, machinery, and appliances, including lock, all taken at eight million dollars (\$8,000,000), the sinking-fund investments to bear the highest rate of interest obtainable, but not less than four (4) per cent per annum.

8. The company will further agree to pay to the United States twenty thousand dollars (\$20,000) annually for repairs, maintenance, and operation of dam, gates, and lock at Dam No. 3; all repairs, maintenance, and operation of the same to be under the direction, care, and responsibility of the United States during the one hundred (100) year period.

9. The company will furnish the United States, free of charge, at Dam No. 3, to be delivered at a point on the lock grounds designated by the Chief of Engineers, electric power not in excess of one hundred (100) horsepower for the operation of the lock.

10. If the United States shall accept the above several proposals in their entirety, then the company offers to purchase from the United States the following properties, viz:

(a) All of the property at nitrate plant No. 2 and its adjacent steam-power plant, land, building, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which have been acquired by the United States (and which the United States has a right to transfer and assign the use of to any purchaser of nitrate plant No. 2), together with the sulphuric-acid units now in storage on the premises.

(b) All of the properties of the United States at nitrate plant No. 1, its steam-power plant, land, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs appertaining to said nitrate plant No. 1 which have been acquired by the United States; but nitrate plant No. 1 shall not be operated as an air nitrogen fixation plant as designed to be.

(c) All of the property at the quarry of the United States, known as the Waco quarry, including all material, buildings, quarry tracks, machinery, railroad tracks, tools, and other equipment.

(d) Also the steam plant, built and owned by the Government at Gorgas, Ala., on the Warrior River, including material, buildings, machinery, fixtures, apparatus, appurtenances, tools, supplies, and the transmission line from the Gorgas steam plant to nitrate plant No. 2, at Muscle Shoals; the United States to acquire title to the right-of-way lands necessary along the transmission line, and also to acquire the title to the land and site occupied by the steam plant and by all Government buildings and other structures at the Gorgas steam plant.

For the foregoing plants and other properties, as set forth and described above under a, b, c, d, the company offers to pay the United States five million dollars (\$5,000,000), the terms of payment to be agreed upon between the Secretary of War and the company, the Secretary of War having the authority to dispose of said plants and other properties as above enumerated.

11. At any time prior to the expiration of said lease period of one hundred (100) years, the company shall have the right to negotiate with the Government for a renewal of the leases for the two above dams, their power houses, etc. In the event of disagreement as to terms of the renewal, the United States and the company shall each appoint an arbitrator, and these arbitrators shall choose a third. The decision of the arbitration board of three shall be final and binding upon both parties.

12. If the United States agrees to sell, and the company purchases these several properties, nitrate plants, quarry, steam power plants, transmission lines, etc., and at prices and on terms mutually satisfactory, the company will operate nitrate plant No. 2 to approximate present capacity in the production of nitrogen and other fertilizer compounds, with the following special objectives:

(a) To determine by research on a commercial scale whether by means of electric furnace methods and industrial chemistry there may be produced fertilizer compounds of higher grade and at cheaper prices than the fertilizer-using farmers have in the past been able to procure, and to determine whether in a broad way the application of electricity and industrial chemistry may do for the agricultural industry of the country what they have economically accomplished for other industries.

(b) To maintain nitrate plant No. 2 in a state of readiness to be promptly operated in the manufacture of materials necessary in time of war for the production of explosives.

13. If the above offers of the company are accepted by the United States, and if the agreement between the Secretary of War and the company can be made for the purchase of the above-described properties, it will naturally and reasonably follow that the buyers of fertilizers will desire to be assured that fertilizers produced at nitrate plant No. 2 shall be sold at fair prices and without excessive profits.

14. To meet this reasonable expectation on the part of the farmers of the country who buy fertilizer, the company proposes that the maximum net profit which it shall make in the manufacture and sale of fertilizer products at nitrate plant No. 2 shall not exceed eight per cent (8 per cent). The company also suggests that a board be created composed of officially designated members and representatives of farmers' national organizations, such as the American Farm Bureau Federation, the National Grange, and the Farmers' Union, together with a representative from the Bureau of Markets of the Agricultural Department (to be an ex officio member of this board, serving in an advisory capacity, without right to vote) and two representatives of the company. It is expected that the board shall have access to the books and records of the company at any reasonable time and that its duty shall be to investigate costs and revenues and to determine for public information whether the profits of the company are being kept within the established limit of eight per cent (8 per cent), as above set forth; and it is also suggested that this board determine upon the territorial distribution of fertilizers produced at nitrate plant No. 2. If and when this board can not agree upon its findings and determinations, then the points of disagreement by the board, at any time, shall be referred to the Federal Trade Commission for arbitration and settlement, and the decision of the trade commission shall be final and binding upon the board.

15. Whenever, in the event of war, the United States shall require any part of the operating facilities of nitrate plant No. 2 for the production of materials necessary in the manufacture of explosives then the United States shall have the immediate right, upon notice to the company, to take over and operate the same for the national defense of the country, and the company will supply the United States with hydroelectric power necessary for such operations, together with the use of all patented processes which the United States may need in time of war for munition purposes and which the company owns and has the right to use, and any of the company's personnel and operating organization required in times of war for operating any part of nitrate plant No. 2 in the manufacture of materials for explosives shall be at the disposal of the United States. All duly authorized agents and representatives of the United States shall have free access at all reasonable times during the lease period to inspect and study all of the operations, chemical processes, and methods employed by the company at nitrate plant No. 2, provided that such agents and representatives shall not use the information and the facts about any of the company's operations, except for the benefit and protection of the United States.

16. It will be obvious to you that, should the above proposals and offers of the company be accepted by the United States, there will be many details in the lease and purchase agreements to be worked out; but it is believed that the above will furnish all of the information required for decision by the United States upon the tender herein submitted.

17. The above proposals of the company are submitted as a whole and not in part.

18. The plans of the company with respect to its hydroelectric power needs are such that it is hoped that you, and those to whom you refer these proposals, will be able to arrive at prompt decisions regarding the company's offer, and that it can be confidently expected that the undersigned will very soon receive an answer to this communication.

Respectfully,

HENRY FORD.

EXHIBIT B.

DEARBORN, MICH., January 11, 1922.

Hon. J. W. WEEKS,
Secretary of War, Washington, D. C.

MY DEAR MR. SECRETARY: Referring to offer of July 8, 1921.

The company proposes to undertake the construction and completion, at actual cost, of all the work referred to; and when completed and ready for operation will pay the United States Government as annual rental of the property an amount equal to 4 per cent of the total cost of such construction.

Very truly, yours,

HENRY FORD.

EXHIBIT C.

PROPOSAL OF HENRY FORD FOR THE COMPLETION AND LEASING OF THE DAMS AND HYDRO-ELECTRIC POWER PLANTS AT MUSCLE SHOALS AND FOR THE PURCHASE OF NITRATE PLANT NO. 1, NITRATE PLANT NO. 2, THE WACO QUARRY, AND THE GORGAS WARRIOR RIVER STEAM PLANT, ALL IN THE STATE OF ALABAMA.

Whereas the United States, through the Chief of Engineers, United States Army, invited the undersigned to submit an offer for the power to be developed at the Muscle Shoals Wilson Dam (hereinafter referred to as Dam No. 2); and

Whereas the undersigned did, under date of July 8, 1921, submit to the Chief of Engineers an offer for the consideration of the President, the Secretary of War, and Congress, which offer proposed a lease based upon the completion of Dam No. 2, and the construction of Dam No. 3 (as designated by the United States Engineers in House Doc. 1262, 64th Cong., 1st sess., and hereinafter referred to as Dam No. 3) and of their power houses, by the United States, and the payment by the undersigned of a fixed annual rental therefor, and proposed to purchase Nitrate Plant No. 1 at Sheffield, Ala.; nitrate plant No. 2 at Muscle Shoals, Ala.; Waco quarry, near Russellville, Ala.; and the Warrior steam plant at Gorgas, Ala., and all transmission lines connected with said plants; and

Whereas the undersigned, at the invitation of the Secretary of War, did, on January 11, 1922, submit a modification of his former proposal, based upon the construction and completion by a company to be formed by him, of all the work referred to in the offer of July 8, 1921, aforesaid, the actual cost of said work to be borne by the United States, and agreed on behalf of said company to pay four per cent (4 per cent) of the actual cost of completing said plants, structures, works, and improvements as annual rental for the lease thereof;

Now, therefore, in lieu of said offer of July 8, 1921, and in accordance with said modification of January 11, 1922, the undersigned hereby submits to the Secretary of War, and through him for appropriate action by the President and Congress, the following offer, which shall become a binding agreement upon approval of same by Congress:

1. For the purpose of carrying out the terms of this agreement, the undersigned will form a corporation (hereinafter referred to as the company), to be controlled by the undersigned, which company will immediately enter into and execute all necessary or appropriate instruments of contract to effectuate this agreement.

2. The company shall complete for the United States the construction work on Dam No. 2, its locks, power house, and all necessary equipment, all in accordance with the plans and specifications prepared or to be prepared or approved by the Chief of Engineers, United States Army, and progressively install the hydroelectric equipment in said power house adequate for generating approximately six hundred thousand (600,000) horsepower, all the work aforesaid to be performed as speedily as possible at actual cost and without profit to the company, it being understood that the necessary lands and flowage rights, including lands for railway and terminal connections, have been or will be acquired by the United States.

3. The company will lease from the United States Dam No. 2, its power house and all of its hydroelectric and operating appurtenances, except the locks, together with all lands and buildings owned or to be acquired by the United States connected with or adjacent to either end of the said dam, for a period of one hundred (100) years from the date when structures and equipment of a capacity of one hundred thousand (100,000) horsepower are constructed and installed and ready for service, and will pay to the United States as annual rental therefor four per cent (4 per cent) of the actual cost of acquiring lands and flowage rights, and of completing the locks, dam, and power-house facilities (but not including expenditures and obligations incurred

prior to approval of this proposal by Congress), payable annually at the end of each lease year, except that during and for the first six (6) years of the lease period the rentals shall be in the following amounts and payable at the following times, to wit: Two hundred thousand dollars (\$200,000) one (1) year from the date when one hundred thousand (100,000) horsepower is installed and ready for service, and thereafter two hundred thousand dollars (\$200,000) annually at the end of each year for five (5) years.

4. The company will further pay to the United States during the period of the lease of Dam No. 2 thirty-five thousand dollars (\$35,000) annually, in installments quarterly in advance, for repairs, maintenance, and operation of Dam No. 2, its gates and locks, it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said one hundred (100) year lease period; and the company, at its own expense, will make all necessary renewals and repairs incident to efficient maintenance of the power house, substructures, superstructures, machinery, and appliances appurtenant to said power house, and will maintain the same in efficient operating condition.

5. At all times during the period of the lease of Dam No. 2 the company will furnish to the United States, free of charge, to be delivered at any point on the lock grounds designated by the Chief of Engineers, United States Army, electric power to an amount necessary for the operation of the locks, but not in excess of two hundred (200) horsepower.

6. As soon as the release of suitable construction equipment and labor forces at Dam No. 2 will permit, or at an earlier date if desired by the company, the company shall construct and complete for the United States Dam No. 3, its lock, power house, and all necessary equipment, all in accordance with plans and specifications prepared and to be prepared by the Chief of Engineers, United States Army, or by the company, at its option, and approved by the Chief of Engineers, United States Army, and progressively install the hydroelectric equipment in said power house adequate for generating approximately two hundred fifty thousand (250,000) horsepower, all the work aforesaid to be performed as speedily as possible at actual cost and without profit to the company, it being understood that the necessary lands, flowage rights, and rights of way shall be acquired by the United States.

7. The company will lease from the United States Dam No. 3, its power house and all of its hydroelectric and operating appurtenances, except the lock, together with all lands and buildings owned or to be acquired by the United States connected with or adjacent to either end of the said dam, for a period of one hundred (100) years from the date when structures and equipment of a capacity of eighty thousand (80,000) horsepower are constructed and installed and ready for service, and will pay to the United States as annual rental therefor four per cent (4 per cent) of the actual cost of constructing the lock, dam, and power-house facilities, payable annually at the end of each lease year, except that during and for the first three (3) years of the lease period the rentals shall be in the following amounts and payable at the following times, to wit: One hundred sixty thousand dollars (\$160,000) one (1) year from the date when eighty thousand (80,000) horsepower is installed and ready for service, and thereafter one hundred sixty thousand dollars (\$160,000) annually at the end of each year for two (2) years.

8. The company will further pay to the United States during the period of the lease of Dam No. 3 twenty thousand dollars (\$20,000) annually, in installments, quarterly, in advance, for repairs, maintenance, and operation of Dam No. 3, its gates, and lock, it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said one hundred (100) year period; and the company at its own expense will make all necessary renewals and repairs incident to the efficient maintenance of the power house, substructures, superstructures, machinery, and appliances appurtenant to said power house, and will maintain the same in efficient operating condition.

9. At all times during the period of the lease of Dam No. 3 the company will furnish to the United States, free of charge, to be delivered at any point on the lock grounds designated by the Chief of Engineers, United States Army, electric power necessary for the operation of the said lock, but not in excess of one hundred (100) horsepower.

10. For the purpose of enabling the Government to create and provide a sinking fund to retire the cost of Dam No. 3 at the end of one hundred (100) years, the company will at the beginning of the fourth (4th) year of the lease period, and semiannually thereafter for the remaining term of the lease, pay to the United States Government the sum of three thousand five hundred and five dollars (\$3,505); and for the purpose of enabling the Government to create and provide a sinking fund to retire the cost of Dam No. 2 at the end of one hundred (100) years the company will at the beginning of the seventh (7th) year of the lease period, and semiannually thereafter for the remaining term of the lease, pay to the United States Government the sum of nineteen thousand eight hundred and sixty-eight dollars (\$19,868).

11. The company agrees to purchase from the United States and the United States will sell the following properties, namely:

(a) All of the property constituting nitrate plant No. 2 (as officially known and designated), including lands, power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, and supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which have been acquired and may be transferred or assigned to a purchaser of nitrate plant No. 2 by the United States, together with the sulphuric-acid units now in storage on the premises.

(b) All of the property constituting nitrate plant No. 1 (as officially known and designated), including lands, power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, and supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which have been acquired and may be transferred to a purchaser of nitrate plant No. 1 by the United States, but the company shall not be obligated to operate nitrate plant No. 1 as an air nitrogen fixation plant.

(c) All of the property constituting the Waco quarry (as officially known and designated), including rights of way and buildings, material, quarry tracks, machinery, railroad tracks, appurtenances, tools, and supplies.

(d) All of the property constituting the steam power plant, built and owned by the Government at Gorgas, Ala., on the Warrior River, including lands, rights of way, buildings, machinery, material, fixtures, apparatus, appurtenances, tools, and supplies and the transmission line from the Gorgas steam plant to nitrate plant No. 2 at Muscle Shoals, and all other transmission lines belonging to the United States and connected with any of the aforesaid Government properties. The United States shall acquire all necessary easements or titles for right-of-way lands along all transmission lines, and convey same to the company, and the United States shall acquire the title to the land and site occupied by the said steam plant and by all Government buildings and other Government structures at the Gorgas plant, which will be conveyed to the company.

12. As the purchase price for the foregoing plants and properties to be conveyed to the company by the United States, the company will pay to the United States five million dollars (\$5,000,000) in five installments, as follows: One million dollars (\$1,000,000) upon the acceptance of this offer, and one million dollars (\$1,000,000) annually thereafter until the purchase price is fully paid, with interest at the rate of five per cent (5 per cent) per annum on deferred payments, with the privilege of anticipating any or all such payments, possession to be delivered upon payment of the first of said installments, and deeds of conveyance to be delivered when full payment for said property has been made.

13. This proposal contemplates and it is agreed that the purchase price for the property aforesaid shall not be diminished by reason of depreciation due to use or wear of buildings, machinery, and equipment or to the action of the elements, nor shall any claim be made for losses in or diminution of quantity of tools and supplies due to upkeep and maintenance during the period between the date hereof and the date of delivery of possession of said property; it being further understood that no inventory of the property need be taken, but that due care will be exercised by the United States in preserving and safeguarding the aforesaid real and personal property intact until possession thereof passes to the company. If any part or parts of the aforesaid plants necessary for proper operation of same have been removed by the United States, said part or parts shall be returned when possession of said plants passes to the company. Deeds of conveyance of real property shall warrant the title to be good and unencumbered.

14. The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control, and further agrees:

(a) To determine by research whether by means of electric-furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer-using farmers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries.

(b) To maintain nitrate plant No. 2 in its present state of readiness, or its equivalent, for immediate operation, in the manufacture of materials necessary in time of war for the production of explosives.

15. In order that the farmers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it

shall make in the manufacture and sale of fertilizer products at nitrate plant No. 2 shall not exceed eight per cent (8 per cent) of the actual annual cost of production thereof. In order that this provision may be carried out the company agrees to the creation of a board of not more than nine (9) voting members, chosen as follows: The three (3) leading representative farm organizations, national in fact, namely: The American Farm Bureau Federation, The National Grange, The Farmers Educational and Cooperative Union of America (or their successors), shall each designate not more than seven (7) candidates for said board. The President shall nominate for membership on this board not more than seven (7) of these candidates, selected to give representation to each of the above-mentioned organizations, said nominations to be made subject to confirmation by the Senate; and there shall be two voting members of said board selected by the company. A representative of the Bureau of Markets, Department of Agriculture (or its legal successor), to be appointed by the President, shall also be a member of the board serving in an advisory capacity without the right to vote. The said board shall determine what has been the cost of manufacture and sale of fertilizer products and the price which has been charged therefor, and, if necessary for the purpose of limiting the annual profit to eight per cent (8 per cent) as aforesaid, shall regulate the price at which said fertilizer may be sold by the company. For these purposes, said board shall have access to the books and records of the company at any reasonable time. The said board shall also determine the equitable territorial distribution of fertilizer products produced at nitrate plant No. 2. If and when said board can not agree upon its findings and determinations, then the points of disagreement shall be referred to the Federal Trade Commission (or its legal successor) for arbitration and settlement, and the decision of said commission in such cases shall be final and binding upon the board.

16. Whenever, in the national defense, the United States shall require all or any part of the operating facilities at nitrate plant No. 2 for the production of materials necessary in the manufacture of explosives or other war materials, then the United States shall have the immediate right, upon five days' notice to the company, to take over and operate the same, and the company will supply the United States with hydroelectric power necessary for such operations, together with the use of all patented processes, which the United States may need which the company owns or has the right to use. When required for national defense any of the company's personnel and operating organization necessary for operating any part of nitrate plant No. 2 in the manufacture of materials for explosives, or other war materials, shall be at the disposal of the United States. For the facilities and services aforesaid the United States shall protect the company from losses occasioned by such use and shall return the said property in as good condition as when received and reasonably compensate the company for the use thereof. All duly authorized agents and representatives of the United States shall have free access at all reasonable times to inspect and study all of the operations, chemical processes, and methods, employed by the company at nitrate plant No. 2, provided that such agents and representatives shall not use the information and the facts concerning any of the company's operations except for the benefit and protection of the United States.

17. In order that said company may be supplied with electric power and the farmers with fertilizers after the termination of the said one-hundred-year leases, should the United States elect not to operate said power plants but determine to lease or dispose of same, the company shall have the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be agreed upon. If the said leases are not renewed or the property covered thereby is not sold to said company, its successors, or assigns, any operation or disposal thereof shall not deprive the company, its successors, or assigns, any operation or disposal thereof shall not deprive the company, its successor or assigns, of the right to be supplied with electric power at reasonable rates and in amount equal to its needs, but not in excess of the average amount used by it annually during the previous 10 years.

18. As a method of procedure in the event of the violation of any of the terms of this proposal or any contracts made in furtherance of its terms, the company agrees that the Attorney General may upon the request of the Secretary of War institute proceedings in equity in the District Court of the United States for the Northern District of Alabama for the purpose of canceling and terminating the lease of Dam No. 2 or Dam No. 3, or both of them, because of such violation or for the purpose of remedying or correcting by injunction, mandamus, or other process any act of commission or omission in violation of the terms of this proposal or any contract made in furtherance thereof.

19. The above proposals are submitted for acceptance as a whole and not in part. Upon acceptance, the promises, undertakings, and obligations shall be binding upon the United States, and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors and assigns; and all the neces-

ary contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned.

Approved and signed by me at Dearborn, Michigan, this twenty-fifth day of January, 1922.

HENRY FORD.

Witness:

W. B. MAYO.

EXHIBIT D.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
January 28, 1922.

Memorandum for the Secretary of War:

Subject: Analysis of the Ford offer for the Muscle Shoals projects, in so far as it pertains to the interests of the Ordnance Department.

1. In compliance with your instructions of the 26th instant, the Ordnance Department has made a hurried analysis of the paper entitled, "Proposal of Henry Ford for the completion and leasing of the dams and hydroelectric power plants at Muscle Shoals and for the purchase of nitrate plant No. 1, nitrate plant No. 2, the Waco quarry, and the Gorgas Warrior River steam plant, all in the State of Alabama," supplied by the Judge Advocate General's Department, in so far as it pertains to the interests of the Ordnance Department, and submits the following comments:

NITROGEN PREPAREDNESS

The main objective of the Ordnance Department in the matter of nitrogen compounds is to make the United States able to be self-sustaining in their supply in time of need. It believes that such ability can only be achieved through the fixation of atmospheric nitrogen by one or more processes, and it further believes that the most economical and enduring method of developing nitrogen fixation is its establishment on a commercial basis.

At the present time there are two methods of nitrogen fixation which seem to be the most adaptable to American conditions, namely, the synthetic ammonia or Haber process and the cyanamid process. The first is the process of United States nitrate plant No. 1, and the second is the process of United States nitrate plant No. 2.

The Ford offer states as follows in the matter of operating and maintaining the nitrate plants:

United States Nitrate Plant No. 1—Article 11(b).—" * * * the company shall not be obligated to operate nitrate plant No. 1 as an air nitrogen fixation plant."

United States Nitrate Plant No. 2—Article 14.—"The company agrees to operate nitrate plant No. 2 at the approximate present capacity of its machinery and equipment, in the production of nitrogen and other fertilizer compounds throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control, and further agrees:

"(a) To determine by research whether by means of electric-furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer-using farmers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries.

"(b) To maintain nitrate plant No. 2 in its present state of readiness or its equivalent, for immediate operation, in the manufacture of materials necessary in time of war for the production of explosives."

Article 16 provides for the taking over and operation of the No. 2 plant by the Government whenever such action is necessary in the national defense and provides that at all reasonable times all duly authorized agents and representatives of the United States shall have free access to inspect and study the operations of the plant.

The process installed at the No. 1 plant, which has not been thoroughly worked out there, has been developed and placed in commercial operation on a limited scale by the Atmospheric Nitrogen Corporation in their Syracuse plant. The objective of the Ordnance Department with reference to this process has, therefore, been achieved and it is not necessary from the standpoint of nitrogen preparedness that the No. 1 plant be perfected and operated.

If the Ford offer means, in the case of the No. 2 plant, that such plant will be operated at its approximate present capacity for the fixation of nitrogen, it is most satisfactory from the standpoint of nitrogen preparedness, for it guarantees the establish-

ment of the nitrogen fixation business on a large, long-enduring, and commercial basis. In other words, it completes the objective which the Ordnance Department believes essential for the making of the United States able to be self-sustaining in its supply of nitrogen compounds.

ORDNANCE-CONTROLLED PROPERTY TO BE TRANSFERRED.

Article 11 outlines the ordnance-controlled property which is to be transferred under the offer and includes (a) nitrate plant No. 2, (b) nitrate plant No. 1, (c) Waco quarry, (d) Gorgas power plant on Warrior River and transmission line from Gorgas plant to plant 2.

Item (d) requires the United States to acquire title to the lands on which the power plant and transmission line are located.

In respect to (a) it is desired to point out that the Ordnance Department now has a contract (T-66) with the American Cyanamid Co. which contains the following clause:

"Article XIX. Sale of plants: If upon cessation of this war or for any other reason the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made) to purchase the same upon as favorable terms as the United States is willing to accept therefor before the United States shall sell the same to any other party."

It is believed that due consideration should be taken of this right of the American Cyanamid Co.

In respect to (b) the offer is believed to be satisfactory.

In respect to (c) the offer is believed to be satisfactory.

In respect to (d) it should be noted that the Ordnance Department now has a contract (T-69) with the Alabama Power Co. which provides definitely for the sale of these properties to that company. The provisions of the contract covering such sale are not quoted on account of length. It is believed that our contractual obligations require us to meet both the spirit and letter of this contract unless the Alabama Power Co. is willing to surrender or sell its rights.

PURCHASE PRICE OF PLANTS.

Article 12 of the offer states that—

"As the purchase price for the foregoing plants and properties to be conveyed to the company by the United States the company will pay to the United States five million dollars (\$5,000,000) * * *"

If this is considered to be only a part of the consideration to be paid, it is not entirely fair to match it up against the estimated salvage value of the properties to be transferred. However, the following summary of estimated salvage values is submitted. No offers have been received to substantiate these figures, although the steam plant at nitrate plant No. 2 is now leased on the basis of \$6,000,000 valuation.

Estimated salvage value of ordnance property in the State of Alabama.

	Approximate cost.	Salvage value		
		As operating concern.	As scrap.	As operating concern and scrap.
United States nitrate plant No. 1, 1,900 acres of land.....	\$12,888,000	(1)	\$600,000	\$600,000
United States nitrate plant No. 2, 2,300 acres of land, including the Muscle Shoals substation (surplus materials at plant 2, costing \$1,500,000 and having salvage value of \$900,000, are included in plant 2).....	69,674,000	(2)	7,250,000	11,640,000
Warrior generating plant.....	3,337,000	\$3,000,000	800,000	3,000,000
Warrior substation.....	384,000			
Drifted railroad.....	50,000			
Warrior-Muscle Shoals transmission line.....	906,000			
Waco quarry, 400 acres of land.....	1,179,000	357,000	102,000	357,000
Total.....	88,417,000	10,032,000	8,812,000	16,272,000

¹ None, with possible exception of the power plant.

² None, unless the Wilson Dam is completed with exception of 60,000 kilowatt steam-electric power plant which has value of possibly \$6,000,000. The value of United States nitrate plant No. 2 as an operating concern depends mainly upon the price which must be paid for power for its operation. If power is to cost \$0.004 per k. w. h. the plant has practically no earning power and therefore has no value. However, if power can be obtained at \$0.001 per k. w. h. the plant has an earning capacity and corresponding value.

³ Basis of steam plant as operating concern and balance of plant as scrap.

⁴ 75 per cent of cost.

In this connection it should be noted also that before the United States can turn over to Mr. Ford all of the properties that he desires that some sort of an arrangement will have to be concluded between the United States and the American Cyanamid Co. which may require a money consideration and arrangements will also have to be concluded between the United States and the Alabama Power Co., which will undoubtedly require a substantial money consideration.

SUMMARY.

The Ford offer from the standpoint of the Ordnance Department has the very important advantage of materially assisting in the development of nitrogen preparedness and has the disadvantages of conflicting with contractual obligations with the American Cyanamid Co. and the Alabama Power Co. and of making a net return to the Government of less than \$5,000,000 for properties which have an estimated salvage value of some \$16,000,000.

The difference, \$11,000,000, appears, therefore, to be the price which the United States is paying for nitrogen preparedness. If the plant is diverted to any purposes which do not include nitrogen fixation, this asset is lost to the Government.

C. C. WILLIAMS,

Major General, Chief of Ordnance, United States Army.

EXHIBIT E.

WAR DEPARTMENT,

OFFICE OF THE CHIEF OF ENGINEERS.

Washington, January 30, 1922.

Memorandum for the Secretary of War.

Subject: Analysis of Mr. Ford's offer for Muscle Shoals power plants.

The following analysis of Mr. Ford's offer for the Muscle Shoals power plant is submitted for your information:

Under the terms of the offer, as concerns hydroelectric plants at Muscle Shoals:

The United States is to furnish the funds for the completion of Dam No. 2, and for the construction of Dam No. 3, including power generating machinery and structures, and is to operate and maintain the dams and locks.

A company to be formed by Mr. Ford is to have a 100-year lease of the power plants, beginning with the dates on which certain specified amounts of power are available at each.

In consideration of this lease the company is to pay: (a) \$200,000 per annum for the first six years that the power plant at No. 2 is in operation; \$160,000 per annum for the first three years that the power plant at No. 3 is in operation, and respectively thereafter a sum equal to 4 per cent of the net capital cost to the United States of the dams and power plants exclusive of the amounts heretofore expended, and exclusive also of the cost of acquiring flowage rights for Dam No. 3.

(b) Specified annual sums to cover the cost of operating and maintaining the dams.

(c) Specified annual amounts designed to produce the sum of \$48,000,000 at the end of the lease period.

In addition the company agrees to maintain the nitrate plant in good condition for use in a war emergency and to produce nitrates at a reasonable profit. As a minor consideration it is to furnish the United States without charge a limited but sufficient amount of power for the operation of the locks at the dams.

The major item of the consideration for the lease is the payment, after specified periods, of 4 per cent on the net capital expenditures to be hereafter made by the Government in furtherance of the agreement. A determination of the adequacy of this return depends upon the future rates of interest that the Federal Government will have to pay on its loans. Considering that the Government is now paying somewhat less than 5 per cent on short-term loans, it is believed reasonable to assume that when the specified full rental begins to run, some 10 years hence, the interest rates paid by the United States will not substantially exceed 4 per cent and may be less.

The payments specified for the operation and maintenance of the dams are considered adequate to meet all ordinary operation and maintenance costs.

The annual payments specified to create an amortization or sinking fund of \$48,000,000 at the termination of the lease are relatively small in amount. The sum eventually produced, with the value of the dams on the termination of the lease, should be amply sufficient to reimburse the United States for the initial capital charge, and the eventual payment of the costs, hereafter computed, of carrying the expenditures in the interval before the full payments begin.

The payments proposed do not cover a return during the period of the lease of the costs to the United States of carrying and expenditures during construction and dur-

ing the early rental periods in which the full rental at 4 per cent is not to be paid, nor does it include a return on the cost of acquiring flowage rights for Dam No. 3. An estimate of the amount in question depends upon the cost of the two dams.

The engineer department's estimate made in July, 1921, for completing Dam No. 2 with its full power equipment is in round numbers \$28,000,000; and in August, 1921, for constructing Dam No. 3, \$28,000,000.

The estimate of Mr. Ford's engineers for completing Dam No. 2 is in round numbers \$23,230,000; for Dam No. 3, \$19,000,000.

Construction of Dam No. 2 has so far advanced that foundation conditions are thoroughly established and the work required can be predicted with certainty, leaving as the only uncertainty the cost of executing the work. The condition does not exist at Dam No. 3, where the foundation work necessary will not be certainly determined until the bed of the river is laid bare. The engineer department's estimates are regarded as adequate to meet any reasonable eventuality of construction at the costs current when the estimates were prepared.

Subsequent to the preparation of the engineer department's estimates the prices of material and labor have generally declined, and it is believed that a reduction of about 10 per cent in the prior estimates is now justifiable. The cost of completing the two dams with power equipment for purposes of this analysis is therefore taken at \$25,000,000 each, in round numbers, or \$50,000,000 in all.

The time of completion of Dam No. 2 has been placed at 40 months, of No. 3 at 36 months. Considering, however, the fact that the hydroelectric machinery for the first 100,000 horsepower of No. 2 is already under contract, and that the first units can be put in operation prior to the eventual completion of the entire installation, it is considered that, for purposes of analysis, the time before payments begin to accrue may be placed at three years for each dam.

Interest during the preliminary period is taken at 5 per cent.

On these assumptions the carrying charges become as follows:

Dam No. 2:

Funds required for completion.....	\$25,000,000
Interest during construction, one-half of three years, at 5 per cent...	1,875,000
Interest for first six years subsequent.....	\$7,500,000
Less six payments of \$200,000.....	1,200,000
Net deficiency.....	6,300,000
Total accrued interest before full payments begin.....	8,175,000

Dam No. 3:

Funds required for completion.....	25,000,000
Interest during construction, one-half of three years, at 5 per cent...	1,875,000
Interest for first three years subsequent.....	\$3,750,000
Less three payments of \$160,000.....	480,000
Net deficiency.....	3,270,000
Total accrued interest before full payments begin.....	5,145,000

The gross cost of carrying the expenditures during the preliminary periods will therefore be \$13,320,000. Such carrying charges are not customarily considered in Government work but are here included in order that the analysis may be complete. The cost of the flowage rights for Dam No. 3 is estimated at \$2,331,000, giving a total of \$15,651,000.

The interest charges on this sum at 4 per cent will amount to \$626,040 per annum during the life of the lease, subsequent to the preliminary period. During the preliminary period these charges will increase from about \$100,000, on the completion of Dam No. 2, to the ultimate figure stated. The exact amount of this annual charge will depend upon the actual costs of the dams and the periods required for construction, but it can scarcely be less than \$500,000 per annum and it should not exceed \$650,000 per annum.

Indirect benefits accruing to the United States are:

- (a) The maintenance of a nitrate plant in readiness for a war emergency.
- (b) The production, in the interest of the public welfare, of large amounts of fertilizer at a cost not exceeding the reasonable cost of production, providing that the production of nitrates adapted to fertilizing purposes is found to be practicable.

(c) The elimination of the cost of maintaining and operating the present imperfect facilities for navigation at Muscle Shoals, amounting to from \$35,000 to \$85,000 per annum.

(d) The advantage to interstate commerce and navigation of the far superior facilities to navigation that will be secured through the construction of the dams and locks.

The funds that have been expended on Dam No. 2 have not been included in the analysis, for the reason that neither the acceptance nor the rejection of Mr. Ford's offer would restore any substantial portion of them to the Public Treasury. If Dam No. 2 be not completed, either by Mr. Ford's company, the United States, or otherwise, the work done will be wholly without value within a brief period of years, and the only recovery possible from the investment already made will be the scrap value of such machinery as can be disposed of, too small in amount to affect the present analysis.

LANSING H. BEACH,
Major General, Chief of Engineers.

EXHIBIT F.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, November 18, 1921.

From: Chief of Ordnance.

To: Secretary of War.

Subject: Cost of United States nitrate plants Nos. 1 and 2 and Warrior-Sheffield power station and transmission line.

1. In accordance with your verbal request, there is attached hereto a summary of the costs of the plants enumerated above.

C. C. WILLIAMS,
Major General, Chief of Ordnance, U. S. Army.

Cost statement of United States nitrate plants Nos. 1 and 2 and Warrior-Sheffield power station and transmission line.

[Submitted by (1. B. Attersall, chief Accounts Branch, Nitrate Division, O. O., Nov. 1, 1921.]

UNITED STATES NITRATE PLANT NO. 1.

Chemical plant.....		\$7, 134, 785. 00
Oxidation plant.....	\$1, 706, 978. 63	
Soda-recovery plant.....	6, 258. 10	
Process plant.....	4, 216, 854. 85	
Neutralization plant.....	109, 978. 56	
Coal and coke storage.....	35, 651. 76	
Gas plant.....	551, 591. 18	
Concentration plant.....	289, 083. 20	
Ammonium nitrate plant.....	218, 390. 72	
Shops.....		314 078 00
Machine shop.....	97, 624. 51	
Storehouse.....	140, 686. 72	
Oil house.....	2, 492. 81	
Warehouses.....	73, 271. 96	
Power house.....		1, 271, 665. 23
Land.....		615, 127. 20
Village.....		2, 526. 276. 28
Permanent village.....	1, 597, 978. 26	
Temporary village.....	928, 298. 02	
Public works.....		1, 026, 011. 60
Roads and walks.....	36, 663. 00	
Sewer system.....	212, 297. 33	
Water system.....	496, 323. 81	
Railways.....	179, 438. 58	
Electric distribution system.....	101, 288. 88	
Total.....		12, 887, 941. 31
Operations: Sheffield operation and maintenance to July 1, 1920.....		794, 359. 85
Grand total.....		13, 682, 301. 16
Maintenance to July 1, 1921.....		75, 506. 42

UNITED STATES NITRATE PLANT NO. 2.

Chemical plant.....		\$35,984,090 55
Raw material and storage group.....	\$2,809,361.53	
Carbide group.....	5,768,305.82	
Cyanamid group.....	4,987,045.31	
Liquid air group.....	4,005,503.09	
Ammonia gas group.....	3,710,872.79	
Nitric acid group.....	12,627,103.90	
Ammonium nitrate group.....	1,236,075.39	
Process steam plant.....	559,577.74	
Laboratory.....	280,245.08	
Shops.....		2,696,481.30
Engine terminal and machine shops.....	937,049.35	
Blacksmith shop.....	187,284.30	
Woodworking shop.....	168,202.88	
Warehouse.....	567,662.53	
Switch house.....	495,772.14	
Foundry.....	90,650.64	
Gate building.....	249,859.46	
Power house.....		12,326,392.23
Land.....		237,711.00
Village.....		3,121,193.31
Ice plant.....	166,312.32	
Permanent dwellings.....	1,984,120.64	
Temporary dwellings.....	(1)	
Hospital.....	142,877.97	
First quarters hotel.....	586,924.89	
Soldiers' barracks.....	240,957.49	
Public works.....		8,843,007.62
Roads and walks.....	583,201.94	
Sewer system.....	1,132,606.80	
Water system.....	2,265,452.59	
Railways.....	2,025,478.13	
Trolley lines.....	173,393.99	
Fencing.....	107,641.25	
Telephone system.....	22,555.46	
Electrical distribution system.....	2,532,677.46	
Inventories (approximately one-half of these inventories have been disposed of).....		3,043,516.20
Waco Quarry.....		1,302,962.83
Construction.....	1,250,000.00	
Land.....	52,962.88	
Total.....		67,555,355.09
Operations.....		3,424,496.85
Rockwood quarry.....	986,858.85	
Muscle Shoals.....	1,840,568.32	
Ordnance maintenance to July 1, 1920.....	597,069.68	
Grand total.....		70,979,851.94
Maintenance to July 1, 1921.....		201,674.63

WARRIOR-SHEFFIELD POWER STATION AND TRANSMISSION LINE.

Warrior generating plant.....	\$3,417,702.70
Warrior substation.....	383,756.35
Transmission line.....	938,057.35
Muscle Shoals substation ²	189,843.99
Drifton Railroad.....	50,421.94
Total.....	4,979,782.33
Maintenance to July 1, 1920.....	25,804.57
Maintenance to July 1, 1921.....	7,056.82

¹ Temporary buildings, the cost of which was \$5,174,377.19, have been allocated to the cost of the permanent plant as overhead.

EXHIBIT G.

WAR DEPARTMENT,
OFFICE OF THE JUDGE ADVOCATE GENERAL,
Washington, January 28, 1922.

Memorandum for the Secretary of War.

Subject: Legal questions involved in Henry Ford's Muscle Shoals proposal.

Instead of discussing at length the legal points involved in Henry Ford's Muscle Shoals proposal, you will observe that this subject has all been covered in one short paragraph in the draft submitted. I am transmitting herewith, however, a copy of my notes covering this subject, originally intended for your consideration as a part of your contemplated report to Congress, which you may find helpful or available for your use if needed.

JOHN A. SMITH, Major, Judge Advocate.

NOTES.

Shortly after receipt by me of the offer of Henry Ford for the leasing of the dams and proposed power plant at Muscle Shoals and disposition of the power to be developed at that place, my attention was invited to certain provisions contained in the contract with the Air Nitrates Corporation, dated June 8, 1918, under which nitrate plant No. 2 was constructed, granting to said company an option to purchase same under certain conditions; also the provisions of an agreement entered into with the General Chemical Co. for the use of its patents and processes in the construction and operation of nitrate plant No. 1, which placed certain limitations and restrictions upon the use of said patents and processes and enjoined secrecy on the part of the Government as long as the Government shall continue to use said processes; also to certain provisions in the contract for the construction of the Gorgas Warrior River steam plant and transmission line constructed by the Alabama Power Co. at the expense of the United States on land owned by said company, but with a provision in the contract authorizing the operation of Gorgas Warrior station under certain conditions and the sale of electricity resulting from said operation upon the payment to the United States of 14 mills for each kilowatt-hour of energy produced, with an option to the Alabama Power Co. to purchase plant at any time subsequent to three years after the termination of the war at a value to be fixed by arbitration; and more important still, the question was raised as to my authority, in view of the provisions of the national defense act, to sell or make any other disposition of these properties, under existing laws. Accordingly these questions as they arose were, from time to time, submitted to the Judge Advocate General for opinion.

I was advised by the Acting Judge Advocate General that the only existing authority for the leasing of public property such as that contemplated herein is that granted in the act of Congress approved July 28, 1892 (27 Stat., 321), which provides for the leasing by the Secretary of War of property of the United States under his control, which may not for the time being be required for public use, for a period not to exceed five years and revocable at any time, and that the only authority for the sale of Government property that might possibly be applicable, in the absence of specific restrictions, is the general authority contained in the act of Congress, approved July 9, 1918 (40 Stat., 850), authorizing the President, through the head of any executive department, to sell war supplies, material, and equipment—

"and any building, plant, or factory acquired since April 6, 1917, including the lands upon which the plant or factory may be situated, for the production of such war supplies, materials, and equipment * * *"

With reference to my authority to sell or lease the Muscle Shoals nitrate plants, or any property acquired by the United States under the authority of section 124 of the national defense act of June 3, 1916, the Acting Judge Advocate General invited my special attention to the following provision in said act:

"The plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital." (39 Stat., 215.)

In the same opinion the Acting Judge Advocate General said:

"It is understood by this office that Muscle Shoals was selected by authority of the President as a site for the nitrate plant authorized by the national defense act, and that plant No. 1 and the Wilson Dam and certain other facilities have been paid for in part from the \$20,000,000 appropriated by the national defense act. It appears that about \$16,000,000 has been expended from that appropriation, chiefly, however, for the construction of the Wilson Dam. It is understood that the land for the nitrate plant No. 1 was paid for from that appropriation but the construction of plant No. 1 and all expenses in connection with No. 2 were paid for from war appropriations for the Ordnance Department.

"It thus appears that the Muscle Shoals nitrate project, considered as a whole, was initiated by Congress by the provisions of the national defense act of June 3, 1916, and that a considerable portion of the expenditures for the plant have been made from the \$20,000,000 appropriated by that act.

"In my opinion the general authority contained in the act of July 9, 1918, supra, for the sale of war supplies and plants acquired since April 6, 1917, does not apply to the Muscle Shoals project, considered as a whole. It is a rule of statutory construction that a general statute does not repeal or supersede a prior particular statute unless there is some express reference to the previous legislation on the subject, or unless there is a necessary inconsistency in the two acts standing together. * * * I consider, therefore, that the provision contained in section 124 of the national defense act directing that the plant therein authorized be operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital is applicable to this plant as a whole and is a restraint upon its sale. The same statute would prevent the lease or rental of the plant for private operation."

Acting upon the advice of the Acting Judge Advocate General, I have taken the position that I have no authority to act finally upon the Ford offer or any other offer submitted for the Muscle Shoals project as a whole, the disposition thereof, in any event, being subject to the will of Congress. It is because of such fact that I submit this proposal to Congress for appropriate action.

With reference to the option to purchase, contained in the contract for the construction of the power plant by the Alabama Power Co., covering the Gorgas Warrior steam plant and transmission lines, which contract was dated and executed December 1, 1917, the Acting Judge Advocate General has advised me that at that time there was no authority under existing law for the sale of such property, and therefore the Secretary of War, or contracting officer representing the United States, was without authority to enter into a contract for the sale of said property or for granting an option for the purchase thereof, and as the Constitution vests in Congress the sole power to dispose of and make all needful rules and regulations respecting the property of the United States, and Congress not having vested that authority in the Secretary of War or anyone else, it was beyond the power of the Secretary of War or contracting officer to bind the hands of Congress in the matter of determining to whom or upon what terms said property might be sold or otherwise disposed of. Attention is also invited to the date of the contract with the Air Nitrates Corporation for the construction of nitrate plant No. 2, which was executed on June 8, 1918. And as there was at that time no authority for the sale of said plant, the same situation exists with reference to the option granted to the Air Nitrates Corporation purporting to give to said corporation an option for a period not to exceed six months after the date of notice stating the determination of the United States to dispose of the same. This provision is nugatory and void and is not binding upon the United States.

With reference to nitrate plant No. 1, which was constructed upon plans of the General Chemical Co. and contained provisions for the use of patents and processes of said company and provided for secrecy in the use thereof, it appears that the General Chemical Co. has treated said contract as at an end and construed the same as binding only so long as the Government shall continue to use said processes. In a letter received from the General Chemical Co. under date of September 13, 1919, replying to a request for certain information from the General Chemical Co., appears the following:

"If, as we understand, your request for information was made pursuant to clause 4 of our tender of June 5, 1917, we need only remind you that by the express terms of this clause our obligation to communicate improvement to the Government was limited to the period during which the Government should continue the use of our process, and that the Government's plant for the use of that process has been shut down for nearly a year."

In reply to an inquiry as to whether or not the equipment used in the synthetic process at nitrate plant No. 1 could be sold or removed from the reservation, without restriction as to its use, the Acting Judge Advocate General said:

"The subject matter of the contract was processes and apparatus, and the machinery installed is not shown to fall within those classes, and no restrictions being set forth as to its use, may be sold without restriction or reservation as to its use, and the future use of the plant by the purchaser as a plant for manufacturing the subject matter embodied in any patents would, of course, be a question between the purchaser and any patentee owning processes to be used.

"Inasmuch as processes covered by the contract are no longer in operation or use by the Government, the prohibition relating to the exclusion of the public is no longer applicable and the equipment, not being the subject matter of the contract, may be sold for whatever purposes the Government may see fit."

With reference to the question as to whether or not the United States may transfer the right, license, and privilege to use any or all patents, processes, methods, and designs which have been acquired by the United States under the license agreement with the American Cyanamid Co., my attention has been invited to the fact that said agreement provides that the United States may transfer to the purchaser of said plant the right to avail itself of the license granted in the operation of the plant so purchased, subject, of course, to the conditions of use granted to the United States, but that it is extremely doubtful that the term "purchaser" as used in the contract could be construed to include a "lessee" of said plant.

With reference to the present use of the Gorgas Warrior steam plant by the Alabama Power Co. under the provisions of the contract for the construction thereof I am advised by the Acting Judge Advocate General that the only authority for such use at the time the contract was entered into was the authority contained in the general leasing act of July 28, 1892, which provided that any use permitted under the authority thereof shall be revocable at any time, and hence the use by the Alabama Power Co. must be construed as subject to termination at any time by the Secretary of War.

With reference to the use of the transmission line and power plant at nitrate plant No. 2, covered by the lease to the Alabama Power Co., dated November 17, 1921, attention is invited to the fact that this lease was executed under the authority of the said act of July 28, 1892, and is, by its terms, revocable at any time.

It is believed that the construction placed upon these contract provisions and upon the lease above mentioned by the law officers of the Army is correct and would be sustained in the event these questions should later arise. In any event Congress may, if it sees fit, ignore them.

STATEMENT OF HON. JOHN W. WEEKS, SECRETARY OF WAR, ACCOMPANIED BY MAJ. GEN. C. C. WILLIAMS, CHIEF OF ORDNANCE; MAJ. GEN. LANSING H. BEACH, CHIEF OF ENGINEERS; AND COL. JOHN A. HULL, ACTING JUDGE ADVOCATE GENERAL.

The CHAIRMAN. It is the desire of the committee, as I understand it, to get through with this matter as reasonably speedily as possible, and we will confine ourselves for the present entirely to the Ford matter.

Mr. Secretary, have any other proposals been made to you?

Secretary WEEKS. Yes; there are two.

The CHAIRMAN. Have you sent them to Congress?

Secretary WEEKS. I have not yet. I am having them analyzed and I will send them in a few days.

The CHAIRMAN. How soon can we expect them?

Secretary WEEKS. I should say by the end of this week.

The CHAIRMAN. Mr. Secretary, the committee would like to have you explain as fully as possible the offer of Mr. Ford, as you understand it; but before you begin with that, I desire to offer for the record section 124 of the national defense act of June 3, 1916, as follows:

"SEC. 124. *Nitrate supply.*—The President of the United States is hereby authorized and empowered to make, or cause to be made, such investigation as in his judgment is necessary to determine the best, cheapest, and most available means for the production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers and other useful products by water power or any other power, as in his judgment is the best and cheapest to use; and is also hereby authorized and empowered to designate for the exclusive use of the United States, if in his judgment such means is best and cheapest, such site or sites, upon any navigable or nonnavigable river or rivers or upon the public lands, as in his opinion will be necessary for carrying out the purposes of this act; and is further authorized to construct, maintain, and operate at or on any site or sites so designated, dams, locks, improvements to navigation, power houses and other plants and equipment or other means than water power as in his judgment is the best and cheapest, necessary or convenient for the generation of electrical or other power and for the production of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizers and other useful products.

"The President is authorized to lease, purchase, or acquire, by condemnation, gift, grant, or devise, such lands and rights of way as may be necessary for the construction and operation of such plants, and to take from any lands of the United States, or to purchase or acquire by condemnation materials, minerals, and processes, patented or otherwise, necessary for the construction and operation of such plants and for the manufacture of such products.

"The products of such plants shall be used by the President for military and naval purposes to the extent that he may deem necessary, and any surplus which he shall determine is not required shall be sold and disposed of by him under such regulations as he may prescribe.

"The President is hereby authorized and empowered to employ such officers, agents, or agencies as may in his discretion be necessary to enable him to carry out the purposes herein specified, and to authorize and require such officers, agents, or agencies to perform any and all of the duties imposed upon him by the provisions hereof.

"The sum of \$20,000,000 is hereby appropriated, out of any moneys in the Treasury not otherwise appropriated, available until expended, to enable the President of the United States to carry out the purposes herein provided for.

"The plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital.

"In order to raise the money appropriated by this act and necessary to carry its provisions into effect, the Secretary of the Treasury, upon the request of the President of the United States, may issue and sell, or use for such purpose or construction herein above authorized, any of the bonds of the United States now available in the Treasury of the United States under the act of August 5, 1909, the act of February 4, 1910, and the act of March 2, 1911, relating to the issue of bonds for the construction of the Panama Canal, to a total amount not to exceed \$20,000,000: *Provided*, That any Panama Canal bonds issued and sold or used under the provisions of this section may be made payable at such time after issue as the Secretary of the Treasury, in his discretion, may deem advisable, and fix, instead of 50 years after date of issue, as in said act of August 5, 1909, not exceeding 50 years."

And also the so-called Leasing Act of July 28, 1892, which was passed by the Fifty-second Congress, first session, as follows:

"CHAP. 316. An act authorizing the Secretary of War to lease public property in certain cases.

"Be it enacted by the Senate and the House of Representatives of the United States of America in Congress assembled, That authority be, and is hereby, given to the Secretary of War, when in his discretion it will be for the public good, to lease, for a period not exceeding five years and revokable at any time, such property of the United States under his control as may not for the time be required for public use, and for the leasing of which there is no authority under existing law, and such leases shall be reported annually to Congress: *Provided*, That nothing in this act contained shall be held to apply to mineral or phosphate lands.

"Approved, July 28, 1892."

Now, Mr. Secretary, will you kindly proceed.

Secretary WEEKS. Mr. Chairman, I am a little embarrassed to know just exactly what the committee wants. I have analyzed the Ford offer in the statement which I sent to Congress. I can do it again if it is desirable, but, of course, it would take a very considerable amount of time. If the committee could ask me any questions it desires regarding any phase of the analysis or the offer, I think the committee would gain time and I would not unduly burden it by much repetition.

The CHAIRMAN. Of course, the committee felt that this whole matter was before us really for the first time, and I think it would be advisable for you to analyze the offer as best you can, and get the matter before us in that way.

Secretary WEEKS. Very well. Very soon after the 4th of March, people interested in the Muscle Shoals development came to me and asked if I would be willing to recommend an appropriation to complete the work there, meaning, presumably, I suppose, the Wilson Dam, although it was not so definitely stated. I replied that when a proposition was made which seemed to me to promise commercial results commensurate with the expenditures that would have to be made, I should consider it my duty to send that proposition to Congress.

On the 8th of July, the first offer came to Gen. Beach, who had been in negotiations with Mr. Ford, or his engineers. That is before you. There were necessarily some considerable delays, which I could refer in detail, if it were desirable. For example, the representative of a very large company informed me at the time that his company proposed to make an offer and asked me if I would delay taking action until they had prepared their offer. That delay covered something like six weeks, and, finally, the president of the company came to me and said they had decided not to make an offer; that they would have made one or would make one, if I had any power to act; not referring to me specifically in making that statement, but if any one had the power

to act, but they did not want to make a competitive offer that might develop into a political controversy. I suppose they had reasons for coming to that conclusion.

Then matters developed from time to time. It was difficult for Mr. Ford to come to Washington. His engineers came more or less frequently. I had consultations with Gen. Beach, Gen. Taylor, and Secretary Hoover, who had come in at my request, being an engineer, and with Mr. Ford's two engineers. Various phases of the Ford offer were discussed, of course, at these meetings. I suggested at the beginning that there should be modifications in the offer; that it was not specific or definite enough in many respects; and, in a word, these negotiations continued until the latter part of November, when Mr. Ford did come to Washington. Unfortunately, I was sick in bed at the time, and it was not desirable for me to go into any matters just then, but I had Mr. Ford come to my house, after seeing Gen. Beach and Gen. Taylor and Mr. Hoover, and talking over the situation with them. Mr. Ford told me then that he intended to go down to Muscle Shoals. As I recall, he said he had only been there one day and he wanted to look it over again and was going to take Mr. Edison down with him and when he had made this inspection with Mr. Edison he would return to Washington and take the matter up with me. He did not return to Washington but sent his engineers. I make no criticism of Mr. Ford for that. We had another discussion, and the engineers finally made several rather specific statements, and I asked them if they had authority from Mr. Ford to make those statements. They said they had not. Then I said that I thought if we were going to make progress on this matter and reach any conclusion, which I was anxious to do, that they ought either to get written authority from Mr. Ford to represent him or that Mr. Ford should come here himself. The result was that Mr. Ford came himself on whatever day is stated in this review, early in January.

The CHAIRMAN. January 11.

Secretary WEEKS. Yes. At that interview—and the members of the committee may have noted the statement which I made at the time, and which Mr. Ford made at the time—Mr. Ford practically dissented from many of the things which his engineers and I had talked over, and which I thought we were in comparative agreement upon, and it did not look as if we had made any progress toward a modification of his offer, except that at about that time he submitted a letter, or his engineers did, resulting from my attempt to get a guaranty from him that he would pay interest on the entire cost of the development and not leave a large amount of money that would have to be provided by Congress on which there would be no return, either in principal or in interest. He submitted the letter, which is in the record, which briefly states that he will pay 4 per cent on the entire additional cost of the completion of the dam after a lapse of six years.

Mr. Ford went away and his engineers went to him, and they did incorporate in his last offer not only this letter, but a good many other things that had been under discussion and somewhat in controversy, particularly relating to paragraphs 16, 17, 18, and 19 of the last offer, which I had insisted, as far as I could, should be done.

Evidently, Mr. Ford after he left my office changed his mind regarding the points in controversy, and put them in the offer, and that makes, in my opinion, a very marked change in the value of the offer from the standpoint of the Government and the people concerned. That is substantially the history of the matter, Mr. Chairman.

I have two propositions in my office, one of which is not completed, as I understand. They are quite different in terms but they should be brought to the attention of the committee so that the committee will have all the information. I have a verbal statement from another responsible company relating to the completion of Dam No. 2. That particular company would complete the dam at its own expense, furnishing the Government with such power as it needed for nitrate purposes, under terms which sound favorable. It is not in writing, and I simply mention it to indicate that others have been and are considering this proposition.

The main impetus to this whole matter is the belief on the part of a great number of people that they are going to obtain fertilizer at a lower cost than has heretofore obtained. I have no opinion to express on that subject because I do not know anything about the manufacture of fertilizer. I think Mr. Ford himself is rather groping in the dark on what the results of his enterprise may be. I judge that, not by what he has said to me. He stated that Mr. Edison thinks he can carry out the plans which he has in mind. If it were not for the possibility of the manufacture of fertilizer and the development of a large industry there, as would result from this offer being accepted, I think it is safe to say that as good an offer could be obtained to develop that proposition as Mr. Ford's. There would be no reason for building Dam No. 3, for example, for any other purpose than to carry out his proposed project.

Just what he intends to do with the power that is to be developed, I do not know. Incidentally, I did put a provision in my statement that the power should be disposed of, if sold, under the same conditions as the power of other companies, either under the direction of the Federal Water Power Board or the public service commission of Alabama, but except for the carrying out of his plans, at this time there would be no reason for the construction of Dam No. 3.

The CHAIRMAN. How much would it cost to construct that dam?

Secretary WEEKS. There are various estimates. I think probably the estimates vary from forty to fifty million dollars for the completion of both dams and equipping them. I have left a pretty wide latitude there. I think the engineers of the War Department, in order to be safe, have probably put the cost higher than it will be. It depends somewhat about Dam No. 3 on the foundations. The committee will understand that the rock in that section is very porous. It is difficult to be sure that you have got a firm, solid foundation. I think they are sure as far as the Wilson Dam is concerned. That foundation, and what has been done, looks as substantial as the Rock of Ages, but there was a development at what is known as Hale's Bar, on the Tennessee River, not far from there, where it was originally anticipated that \$3,000,000 would be expended, and \$11,000,000, as I recall, was expended before the dam was completed. There were caves and holes and all that sort of thing under the dam which had to be filled in at very great expense. The foundations of Dam No. 3 have not been as clearly determined as engineers would like before they say the final word, and that is one reason for the variation in the estimate for the construction of these dams. If there is no material fault in the foundations, my judgment is that these dams would be completed and equipped for between forty and forty-five million dollars. If there is material fault found there, which has to be corrected, I should think no one could say exactly how much it would cost. I am speaking, Mr. Chairman, as a layman now, rather familiar with the discussions that have taken place relating to the subject.

The CHAIRMAN. I think in Mr. Ford's offer he puts the probable cost at \$42,000,000.

Secretary WEEKS. There have been contractors, who have tentatively looked over the proposition, and they can determine pretty definitely about the completion of the Wilson Dam, but there are no specifications drawn yet relating to Dam No. 3. I think I am right about that, Gen. Beach?

Gen. BEACH. Yes, sir.

Secretary WEEKS. So no man can make an estimate yet of what the cost will be. I think there is a pretty wide latitude there from forty to fifty million dollars, which would be pretty certain to cover the requirements.

The CHAIRMAN. The \$42,000,000, as I recall, was for the completion of Dam No. 2.

Secretary WEEKS. Oh, you are mistaken. That would complete both dams. Incidentally, I think I am justified in saying that any delay that has taken place on account of the negotiations that have been going on has been entirely justified from the standpoint of probable cost. The estimates a year ago were substantially \$10,000,000 higher than any one puts them to-day. The cost of construction has very materially declined, and I think it is safe to say that the delay of a year in the completion of that dam will save whoever furnishes the money to complete the whole project from five to ten million dollars at least.

The CHAIRMAN. Have you anything further to submit, Mr. Secretary?

Secretary WEEKS. I expressed a doubt, Mr. Chairman, a few minutes ago about the final results of the fertilizer development. Very largely the impetus for the completion of this project came from those who believed that they were going to get fertilizer at a lower cost.

Mr. Ford's modified offer in sections 17, 18 and 19, does give some assurance that a real attempt will be made to do this. I say "some assurance," a great deal of assurance. It will be noted in his first offer, to which I made strong objections he stated he was going to form a company or a corporation for the purpose of carrying out this general proposition. There was no statement made of the amount of capital with which that company should be equipped or anything relating to Mr. Ford's connection with it. It did not seem to me that that was a sufficient assurance that the work would be carried out, at least, during the life of the contract, and Mr. Ford has partially remedied that by providing that proceedings may be brought against him: that he and his estate, in other words, will back up this company. Now, just what those proceedings would amount to, in case he stopped manufacturing fertilizer, except a matter of damages against him or against the company which he forms, I am not very clear, and I have not submitted to the law department of the War Department any question on that subject. That is something that the com-

mittee may well take under consideration, but I did suggest that it seemed to me that there should be a forfeit in case of a failure to carry out that part of the agreement, because in my conversation with Mr. Ford I said to him, "Will you guarantee to continue to manufacture fertilizer during the life of this contract?" He replied that he would not. I said, "Will you agree to invest a certain definite amount of money in the manufacture of this fertilizer," and he said he would not. Now, of course, he does, in effect.

I said then, in effect, "You might stop the manufacture of fertilizer in five years or in any other time to the great disappointment of the people down there," and he said, "Of course, I am going to stop if I can not manufacture it profitably."

Now, that being the case and that idea being apparently in his head, it seems to me there should be some kind of forfeiture in case he fails to carry out this part of the agreement relating to the manufacture of fertilizer.

Mr. Ford is getting on in years. He is not going to be here many years, and no one knows what form his estate will be left in, and I think there should be a suitable guaranty that that part of this agreement is to be carried out in good faith by his successors without the necessity of bringing suit for damages.

Mr. GARRETT. Do you have in mind any amount of liquidated damages?

Secretary WEEKS. You mean in that case?

Mr. GARRETT. Yes, sir.

Secretary WEEKS. That would depend altogether on the benefits that are going to be obtained from the fertilizer and the price at which he is going to be able to furnish fertilizer to the people in that region. I know that frequently we hear the producers of fertilizer referred to as the fertilizer trust. I think there are two large companies and many smaller ones producing fertilizer in the United States, and this is interesting: One is the Virginia-Carolina Chemical Co. and the other is the American Agricultural Chemical Co.

The latter company was organized about 20 years ago, made up of various companies that had been operating independently, on a basis of giving to every stockholder a share of preferred stock and a half share of common stock for \$100. The share of preferred stock is now selling at \$57 a share and the share of common stock at \$34 a share, so that the selling price of what the people 20 years ago paid \$100 a share for is now \$74 a share, and the company has never paid over 6 per cent on its preferred stock and only paid dividends on its common stock three or four years. Seven per cent on the actual money paid in would cover the total dividends annually on the stock of that company, and yet 20 years afterwards its stock is selling at three-fourths of the price of which it was originally sold to the public. This would indicate that the profits have not been excessive; and that leads me to conclude that there may become doubtful about whether fertilizer can be manufactured by different methods which will show a profit, and whether it can be manufactured at a profit under some experimental methods has a bearing on Mr. Ford's statement about not continuing to manufacture.

The CHAIRMAN. When did Mr. Ford make that statement to you that he would discontinue manufacturing fertilizer if it was not carried on profitably?

Secretary WEEKS. That was at the interview on the 11th of January. I think you reminded me of the date. That is the only time I have ever had any considerable discussion with Mr. Ford personally.

The CHAIRMAN. That interview took place, as I take it from what you have said, about two weeks before he signed this second agreement which is now before us.

Secretary WEEKS. Yes.

The CHAIRMAN. You have had no interview with him between the time he told you what he did and the time he sent you that signed agreement?

Secretary WEEKS. Not with him personally. His engineers remained in Washington and assisted the Judge Advocate General's Department in preparing the new agreement or the new offer of Mr. Ford in the form of a contract. His letter relating to paying 4 per cent on the additional cost of completing the construction had to be incorporated in his original agreement, and that, and the other things to which I have referred in those paragraphs at the end of the offer, which are substantially new, were all agreed to by his engineers with our Judge Advocate General's Department. One of them then took the statement to Mr. Ford in Detroit and he signed it and sent it back by the same messenger.

The CHAIRMAN. Would you like us to begin asking you questions now?

Secretary WEEKS. I think that is the best method to get at the information which the committee wishes, Mr. Chairman. I could talk about this a long time.

The CHAIRMAN. I notice at the end of your statement sent to the Speaker of the House you make some references to apparent omissions on the part of Mr. Ford in connection with his second agreement. (On page 10 you say:

"I also suggest that the cost of acquiring the lands and the flowage rights necessary for Dam No. 3 should be included in the cost on which Mr. Ford is to pay 4 per cent interest."

Secretary WEEKS. That is a matter of figures, Mr. Chairman. Of course, that one item is much more important in this whole transaction than the amortization which he proposes to make for the payment of the principal at maturity; probably twice as important in the matter of dollars and cents. Our engineers estimate that it will be likely to cost \$2,000,000 to obtain the land and flowage rights which would be affected by the construction of Dam No. 3. That figure may be high. Mr. Ford's engineers placed it lower. I do not believe any one knows exactly, because I do not think they have gone into it in sufficient detail, but Mr. Ford's engineers express the view that it would not be over \$1,500,000; but anybody can take his pencil and figure what \$1,500,000 paid at this time would amount to in 100 years, and it will be found, of course, that that is of very great moment compared with the fund proposed to be established to amortize this debt, and that was my reason for saying that I thought that amount should be included in the cost of the enterprise. It is a part of the cost of the enterprise.

The CHAIRMAN. As I understand the proposition, Mr. Ford makes an offer to lease a certain part of the plant, and then he wants certain other parts of the plant sold to him outright; that is, the nitrate plants 1 and 2, and the Waco quarry, and also the Warrior River plant and the transmission line. He wants that sold to him outright.

Secretary WEEKS. Yes.

The CHAIRMAN. And he wants to lease the Wilson Dam and also Dam No. 3 when it is completed.

Secretary WEEKS. Yes.

The CHAIRMAN. You make some comment in your letter about the sale of those nitrate plants. What was the original cost to the Government of those plants?

Secretary WEEKS. About \$87,000,000.

The CHAIRMAN. And he wants to buy them outright for \$5,000,000.

Secretary WEEKS. That is his offer.

The CHAIRMAN. I presume we had better take up those matters in detail with the Chief of Ordnance, when we come to that.

Secretary WEEKS. Mr. Chairman, in order that I may make clear that statement, Congressman Quin calls my attention to the fact that perhaps I did not answer the question correctly. I understood you to ask me about the cost of nitrate plants Nos. 1 and 2, the Warrior plant, the Waco quarry, and the transmission line.

The CHAIRMAN. Yes.

Secretary WEEKS. And I stated about \$87,000,000. I have said in my statement to the committee here \$85,000,000, and that is probably nearer correct than \$87,000,000, but that does not include what has been expended in the construction of the Wilson Dam which is between sixteen and seventeen million dollars.

The CHAIRMAN. Of course, the Wilson Dam is not yet completed. You say in your letter that it is about 30 per cent completed and it will require, according to the Army engineers, to build and complete the Wilson Dam and also Dam No. 3, about \$50,000,000.

Secretary WEEKS. Yes. The cost of what has been done at the Wilson Dam, of course, is very much higher than the same cost would be at this time. I do not know about the 30 per cent. I am not very clear in my own mind about that.

The CHAIRMAN. I think your report states that it is about 30 per cent completed.

Secretary WEEKS. I think the Wilson Dam could be completed for \$22,000,000, which would make a total of about \$39,000,000 for that dam, but if it were constructed at this time I think it could be constructed for \$30,000,000, and bear in mind, Mr. Chairman and gentlemen, that I am talking as a layman about these figures and engineering propositions, because I am not an engineer; but this is stated after considerable familiarity with the discussions that have been held in my presence by engineers representing both sides of the matter.

The CHAIRMAN. Have you with you, Mr. Secretary, an itemized cost account stating just exactly how much money has been expended by the Government up to the present time on all these projects?

Secretary WEEKS. I have an itemized statement, and it was included in what was marked "Exhibit F" in the report which I sent to Congress, on page 23, of the cost of the nitrate plant and everything, I think, except the Wilson Dam. That is the engineers' statement.

The CHAIRMAN. In Exhibit F, on page 21 of the pamphlet, there is a statement of the approximate cost of the nitrate plant, of the Warrior River plant, the Waco quarry, and so on.

Secretary WEEKS. If you will turn to page 23, you will find what are supposed to be the accurate costs of those nitrate plants and the Warrior-Sheffield power station and transmission line.

The CHAIRMAN. Will you kindly state for the record just what that would amount to?

Secretary WEEKS. Mr. Chairman, not including maintenance, the total cost is \$85,423,078.23.

The CHAIRMAN. For nitrate plant No. 1—

Secretary WEEKS (interposing). That includes the properties that Mr. Ford proposes to buy.

The CHAIRMAN. Mr. Ford proposes to lease the Wilson Dam and also Dam No. 3, which has not even been begun.

Secretary WEEKS. Yes; that is what he proposes to lease; the two dams, electrically equipped, of course.

The CHAIRMAN. And what have they cost the Government up to the present time?

Secretary WEEKS. \$16,251,000.

The CHAIRMAN. For the two dams?

Secretary WEEKS. Nothing has been done on Dam No. 3.

The CHAIRMAN. Nothing has been done on that property at all?

Secretary WEEKS. There may have been some exploration work and the Chief of Engineers is here and can inform you about that when he testifies.

The CHAIRMAN. What is it estimated it will cost to complete Dam No. 3.

Secretary WEEKS. I have explained, Mr. Chairman, that that is one of the indefinite matters connected with this enterprise. If they find a relatively good foundation, I should think it would cost not far from \$20,000,000. If the foundation is a difficult one, it may cost much more.

The CHAIRMAN. You make a recommendation that a lease of 100 years would be, in your opinion, a little too long, and you suggest possibly a 50-year lease. Why do you make that recommendation?

Secretary WEEKS. Mr. Chairman, I think that is a better public policy. It is the policy that has been adopted in the passage of the water power legislation. One hundred years is a long time. All kinds of things may develop and change in that time, and I do not think, on the whole, it is good public policy to make as long a lease as that. It may be varied from, in some instance, and Congress may decide that it is wise to do it, but I would very much prefer to make a lease of 50 years.

The CHAIRMAN. What suggestion do you make with reference to Dam No. 3, or to any work to be done on Dam No. 3, if the committee should not wish to take up Mr. Ford's proposition.

Secretary WEEKS. I do not think the local conditions at this time, for any other reason than Mr. Ford's project which he may have in mind, would justify the building of Dam No. 3. As I state in my report, I think they do justify the completion of Dam No. 2, and that would be my recommendation.

The CHAIRMAN. Upon what terms does Mr. Ford propose to lease Dams Nos. 2 and 3?

Secretary WEEKS. They are stated very clearly in his proposal.

The CHAIRMAN. Now, Mr. Secretary, we will begin to take up such matters as the other members of the committee may desire to ask you about. Mr. McKenzie will ask the questions that he desires to ask you.

Mr. MCKENZIE. Mr. Secretary, I will be very brief. If we should adopt your suggestion to change this plan from a 100-year term to a 50-year franchise, it would simply be a refusal to accept the offer made by Mr. Ford and would necessitate the submission of an entirely new proposition, would it not?

Secretary WEEKS. It would unless Mr. Ford agreed to it.

Mr. MCKENZIE. In case Mr. Ford should agree to a 50-year franchise, he undoubtedly would want different conditions contained in the contract from those in the proposal he has made here for a 100-year franchise.

Secretary WEEKS. He would want to change his method of amortizing the debt, of course, basing it on 50 years instead of 100 years, but I do not think it would make any material difference otherwise. You must remember, Mr. McKenzie, that I have been dealing with Mr. Ford in this very considerable transaction, he having the knowledge as well as myself that I had no power to complete anything or to conclude anything, and unless Congress gives somebody the power to do it or does it itself, no changes can be brought about such as could be made in a negotiation which two individuals would enter into if they were considering such a proposition.

Mr. MCKENZIE. If it were based on a 50-year franchise, that would proportionately increase the expense to Mr. Ford for the benefit he would derive from the proposition.

Secretary WEEKS. He would amortize the indebtedness so that the annual expense would not be any greater, but it would not be entirely paid at the end of 50 years.

Mr. McKENZIE. Of course, it is true as you suggested, that the waterpower legislation provides for a 50-year term franchise?

Secretary WEEKS. Yes.

Mr. McKENZIE. That was a controverted question, was it not?

Secretary WEEKS. I think it was.

Mr. McKENZIE. There are very many who hold the view that a long-term franchise is advantageous not only to the licenses, but also to the general public; is that not true?

Secretary WEEKS. Yes. I am simply expressing my own personal view in the matter.

Mr. McKENZIE. However, if the committee should object to the 100-year proposition, as one element in the plan, it would necessarily involve the redrafting of the whole proposition, would it not?

Secretary WEEKS. I do not think there would be any material redrafting. There would have to be a redrafting of the amortization plan.

Mr. McKENZIE. In regard to your suggestion that if this plan should go through there should be some provision put in which would make Mr. Ford's company liable under the State laws of Alabama, or that might bring him under the general water-power law of the country, is it your view that there is not an implied understanding that he would come under those laws, regardless of any specific reference to it in the contract?

Secretary WEEKS. I do not know whether he would be or not. That was discussed, and there was some little doubt about it. There is no reason why it should not be put in, if there would not be any certainty about it.

Mr. McKENZIE. So far as you know, neither Mr. Ford nor his representatives have any objection to that sort of a provision going in?

Secretary WEEKS. I think they would not have.

Mr. McKENZIE. Now, Mr. Secretary, in regard to the amount to be paid by Mr. Ford for the property he is to take, that is, his offer of some \$5,000,000, as set forth in the contract, is it your judgment that that offer was based on what he considered a fair salvage value for the property, if taken over, simply as a matter of salvage, or was the figure of \$5,000,000 put in as a part of the consideration of the whole scheme? In other words, if there were no other conditions connected with this matter, would it not be reasonable to presume he might have made a greater offer to take that property over as a mere matter of salvage?

Secretary WEEKS. I can not tell what course of reasoning Mr. Ford and his engineers followed to arrive at the \$5,000,000 figure, but they have refused in any way to modify it.

Mr. McKENZIE. I notice by your letter and the report of the engineers that the maximum sum that can be expected to be received from the sale of this property would be \$16,000,000?

Secretary WEEKS. A little in excess of \$16,000,000.

Mr. McKENZIE. And that you think a fair estimate would be \$8,000,000?

Secretary WEEKS. The \$8,000,000 is based entirely on scrapping and salvaging the property, and the War Department has done so much of that kind of thing that its estimates are fairly accurate as to what can be obtained by scrapping.

Mr. McKENZIE. It has occurred to me, Mr. Secretary, that the minds of Mr. Ford and the Army engineers did not meet on the point of the salvage value in its entirety, that Mr. Ford took into consideration other elements in connection with the whole proposition and simply said that among other things he would give \$5,000,000 for this personal property.

Secretary WEEKS. I can not tell about that. Of course, there has been a great deal of discussion about this matter. Mr. Ford originally proposed to pay 6 per cent on \$20,000,000 as the amount he was willing to provide for the completion of the dams. That matter was discussed for a long time, and his engineers repeatedly said to me that Mr. Ford could not afford to do any more than that because he was going to put ten or twelve million dollars into a plant for the manufacture of fertilizer, and that would prohibit his paying interest on any more of the cost of construction and make the proposition a reasonable one from a commercial basis. That would seem to indicate that they had considered all parts of this offer. Of course, Mr. Ford has modified the matter of the payment of interest on the cost of construction.

Mr. McKENZIE. I take it from your statement, Mr. Secretary, that you have some apprehension as to whether or not Mr. Ford or his company would continue the manufacture of fertilizer at this plant through the whole period of the lease.

Secretary WEEKS. If I were operating for myself and this were my property, I should insist on a guaranty that the manufacture should continue during the life of the contract, and I say that without any reflection whatever

on Mr. Ford or Mr. Ford's estate, or on the company he is going to form. That is simply a common-sense business proposition.

Mr. McKENZIE. I am not sure but what you are right about that, Mr. Secretary, because there is no question whatever but that the interest of the people of this country has been centered around the fertilizer proposition at this particular place. But I take it from your statement, further, that the manufacture of fertilizer has not been a great financial success, up to date, in this country.

Secretary WEEKS. I do not want to say that finally in any specific case, because I do not know.

Mr. McKENZIE. Speaking of the two large companies—

Secretary WEEKS (interposing). I just happened, last night, in glancing through a stock-exchange list in the newspaper, to let my eye fall on the American Agricultural Chemical Co. stock, and that was the reason I gave you that illustration. I had no thought of doing it before; it was a mere matter of chance.

Mr. McKENZIE. That being true, it argues further the hazardous undertaking of the Government attempting to manufacture fertilizer at this point or any other point.

Secretary WEEKS. I am opposed to the Government doing it under any circumstances, engaging in the manufacture of fertilizer or incidentally entering into any other business in competition with its citizens.

Mr. McKENZIE. You have included in your letter comments of the officers in the Judge Advocate General's Department relative to certain propositions affecting this proposition.

Secretary WEEKS. Yes.

Mr. McKENZIE. Is it your understanding that the claims of the Alabama Power Co. are without foundation in law?

Secretary WEEKS. That seems to be the opinion of the Judge Advocate General's Department. That contract was entered into by the contract section of the War Department during the war, and they agreed to the option. The officers of the Judge Advocate General's Department say that the contract section had no right to do that. Assuming that that is true, I think the committee and Congress may properly consider whether or not a moral right in equity exists. I, personally, do not like to see the Government enter into any contract through its authorized agents which is not carried out. It should not cut sharp corners under any circumstances.

Mr. McKENZIE. Are the representatives of the Judge Advocate General's Department here this morning?

Secretary WEEKS. Yes. Col. Hull, the Acting Judge Advocate General, is here.

Mr. McKENZIE. We will take that up with them. I was interested in having a statement from you, in view of the fact that you had mentioned it in your letter.

Secretary WEEKS. I was very much surprised when I received that decision.

Mr. McKENZIE. In your consideration of the matter with Mr. Ford, it is evident from the contract that he did not ask any guarantee from the Government as protection against the claims of these two companies, the American Cyanamid Co. and the Alabama Power Co.?

Secretary WEEKS. Undoubtedly he expects the Government is going to furnish him with a clear title to the properties which he is buying.

Mr. McKENZIE. I notice further in your letter you recommend the completion of the Wilson Dam, whether or not we accept Mr. Ford's offer?

Secretary WEEKS. Yes. That really has nothing to do with Mr. Ford's proposition, but I wanted to express the opinion that I believed that the development of that region and the requirements for power, considering the present condition of the dam, warrants its completion by the Government. I have not very much doubt, although I can not say this with certainty, that the Government could complete that dam without taking a dollar from the Treasury, issuing bonds that could be sold, based on the dam, and the sale of the water power that could be contracted for. And, while I say I have not any proposition that shows that definitely, I believe that could be done. That region needs, or is going to need very soon, additional power, and there is the possibility for it, and it should be used. You may understand that we are now leasing the power plant at nitrate plant No. 2 to the Alabama Power Co., and in effect that power reaches the mills of North Carolina. I had to make that lease while these negotiations were on rather against the protest of at least one of Mr. Ford's engineers. Mr. Ford himself, personally, did not object, however, because there was a shortage of power in North and South Carolina, and that was the only available place to get power. So that power plant was started, and power is so diverted that in the final analysis the power generated at that plant reaches the mills of North and South Carolina. I did that after I had a careful investigation made by officers of the Ordnance Department as to whether the shortage of power really existed, and it did exist. There was no other place to obtain it, and people would have been thrown out of employment if that had not been done.

Mr. McKENZIE. How far can power be transmitted?

Secretary WEEKS. You will have to ask one of the officers about that; I do not know. I do not mean to say that power is now being transmitted from Alabama to North Carolina. It is being diverted so that it reaches North Carolina. What I mean to say is that it has a specific application to this 100-year lease—in that nobody knows what we are going to see in 10 or 20 years in the transmission of power. It is in its infancy. We can develop perfectly enormous power in the Colorado River. The greatest power in the United States, far and away, is there, and I anticipate that in the course of a comparatively few years there will be means of transmission of power to the Central West, anyway, and perhaps to the whole country.

Mr. McKENZIE. It is being transmitted now as far as 200 miles, is it not?

Secretary WEEKS. More than that. I am reminded that it is being transmitted 700 miles in California. I am not personally familiar with that.

Mr. McKENZIE. At any rate, if this proposition is turned down by the committee, you would recommend the completion of this dam for power purposes, and in that event possibly all of these improvements would be salvaged and dismantled.

Secretary WEEKS. Would be salvaged. I suppose members of the committee have been there. There are two villages there, one at nitrate plant No. 1, the Sheffield plant, and one in Florence. There are 400 or 500 houses at those plants, and most of them are not occupied. A few of them are occupied by our officers and men who are there. Those houses are of stucco construction, reinforced concrete, or whatever it may be. I went into one of them, and there is not one of them that is not suitable for any man to live in unless he has a family which is too large. If there is any development of commercial enterprise there, those houses are coming into the market, and while the estimate of their salvage value is very small now, I have no doubt those houses cost \$3,000 or \$3,500, and that they would cost \$2,500 each now, on an average, and you could get quite a large salvage value out of them.

Mr. McKENZIE. But this much can be said in favor of this proposition, perhaps, that Mr. Ford agrees to take over all that property for the sum of \$5,000,000, and that he will continue to operate the nitrate plant from which we expect to get the material to make explosives.

Secretary WEEKS. He will keep the nitrate plant in condition for the Government's use, and that is favorable from the standpoint of the War Department.

Mr. McKENZIE. He further agrees to undertake the manufacture of fertilizer to the maximum amount of 110,000 tons per annum?

Secretary WEEKS. He does now, yes.

Mr. McKENZIE. To that extent he is taking on a pretty good-sized contract on his part?

Secretary WEEKS. Undoubtedly.

Mr. GREENE. Mr. Secretary, if this offer were declined, considering your suggestion that the completion of the Wilson Dam be carried through, would it be done with the idea of maintaining it as a Government enterprise, or simply preparing it to get it into shape for salvage?

Secretary WEEKS. I think the whole thing could be leased and in time probably salvaged, but that is simply an expression of opinion on my part.

Mr. GREENE. Then, so far as I understand it, this whole business is looked upon primarily as a proposition for salvage, and that the question is between one, two, or three or any different forms of salvage which may be offered is simply which form carries with it the greatest operating benefits and the best financial terms?

Secretary WEEKS. Yes.

Mr. GREENE. Salvage is the motive in the whole proposition?

Secretary WEEKS. The motive is to get the Government out of an enterprise in which it is involved as a result of the war.

Mr. GREENE. Are you prepared to give us anything like an opinion for the record as to whether, if this particular form of Mr. Ford's offer should be declined, that would terminate all negotiations with him, or whether he might be likely to come back with a second proposition?

Secretary WEEKS. I am not justified in speaking for Mr. Ford in that matter, but as I tried to explain awhile ago, I have taken the position that unless something were done we would not make a trade. My position was to get the best offer possible from Mr. Ford or someone else and send it to Congress.

Mr. GREENE. I appreciate that, and I did not mean to ask the question to put you into the attitude of expressing Mr. Ford's mind. I wondered whether the negotiations were attended with such circumstances as might lead to the reasonably presumable assumption that he would come in with another offer.

Secretary WEEKS. I do not know that he would come in with another offer, but he might make some changes in this offer.

Mr. HULL. You were speaking of scrapping, when you had estimates made in connection with nitrate plant No. 2. You would not recommend that, would you?

Secretary WEEKS. I would not; no. That refers entirely to No. 2.

Mr. HULL. Yes; I am glad to hear you say that. In Mr. Ford's offer he speaks of a profit of 8 per cent on the fertilizer, and any estimates made as to his offer would include the 8 per cent?

Secretary WEEKS. We had some difficulty in reaching a conclusion, but the final conclusion was that it was 8 per cent on the turnover.

Mr. HULL. That would be rather excessive, would it not?

Secretary WEEKS. I would not want to go into the manufacturing business unless I thought I could make relatively 8 per cent.

Mr. HULL. We found it very excessive in the war, in connection with these cost-plus contracts, did we not?

Secretary WEEKS. This is not a cost-plus contract.

Mr. HULL. It is 8 per cent on the turnover, even if he turns it over two or three times.

Secretary WEEKS. I am talking about the turnover of the product, Mr. Hull. If he sold \$100,000,000 worth of fertilizer his excess profit would be \$8,000,000.

Mr. HULL. That would all depend on the number of times he could turn it over in a year?

Secretary WEEKS. Yes.

Mr. HULL. If it took him a year for one turn over, 8 per cent would not be excessive, but if it turned over four or five times it would be very excessive; is that not true, Mr. Secretary?

Secretary WEEKS. I think in the case of fertilizer manufacturing the turnover is about once a year. You will note that in Mr. Ford's offer he says:

"In order that the farmers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it shall make in the manufacture and sale of fertilizer products at nitrate plant No. 2 shall not exceed 8 per cent of the actual annual cost of production thereof.

Mr. HULL. That is another thing; that is 8 per cent—

Secretary WEEKS. That is the production of fertilizer.

Mr. HULL. You spoke of the financial responsibility, or what was back of the offer of Mr. Ford. Would it not be better to have incorporated in one of his offers the amount of the paid-up capital stock of the company he is going to operate? That is very indefinite. He simply says he is going to form a company; he does not know anything about how much paid-up capital the company is to have. Should it not have some paid-up capital?

Secretary WEEKS. You have noted in his original offer he simply said that this operation would be conducted by a company or corporation to be formed.

Mr. HULL. I think that was in the second one, too.

Secretary WEEKS. Yes; but now he goes on to say that he would combine the two companies. I think that is referred to in paragraph 18. In any case the first offer in that regard was so indefinite and undesirable from a business standpoint, that that is one of the things I have been pushing to have corrected. Either the company should have a capital sufficient to insure that this will be done, or there should be some sort of a guarantee to provide for the result of failing to do it; not that Mr. Ford is not personally responsible, or his estate, probably, but a suit for damages in case there were failure to carry this project out after Mr. Ford is gone, might bring very unsatisfactory results.

Mr. HULL. That is the very point I wanted to make. I wanted to know if it would not be better, if we are going to accept the proposition, to know how much paid-up capital is behind the company he is going to operate?

Secretary WEEKS. I think that would be a wise step. But I think in view of Mr. Ford's engineers' suggestion that he expected to invest ten or twelve million dollars in the manufacture of fertilizer that might be considered their opinion of his idea of the capital of this company.

Mr. HULL. That might be a subsidiary company not operating the dams at all.

Secretary WEEKS. I think his company is to carry out the entire operation; I think it is intended that it should do that.

Mr. HULL. That might be true, or it might not be.

Secretary WEEKS. I do not know about that.

Mr. HULL. You spoke of the manufacture of fertilizer not being profitable.

Secretary WEEKS. I wish you would not put it in that way.

Mr. HULL. I am not trying to put something in your mouth you did not say; I just refer to that. Two of these companies you cited—

Secretary WEEKS (interposing). One company I cited.

Mr. HULL. Yes; I believe you cited only one company; but that company does not manufacture nitrates, it simply assembles the nitrates it buys of the importers; is that not true?

Secretary WEEKS. Undoubtedly.

Mr. HULL. This is an entirely different proposition. This is evidently for the manufacture of the nitrates which would take the place of the Chilean nitrates, which are imported.

Secretary WEEKS. We can fix nitrogen, however, at that plant, without any question. I want to offer this opinion, however, that the fixation of nitrogen is in its infancy, and that ten or twenty years from now we will be surprised at the development which has been made. If you will ask Gen. Williams the question he will tell you about observations he has made recently along that line which would substantiate the general statement I made in that regard.

Mr. HULL. I think that is true; but my point was that in the manufacture of nitrates this company which you cite probably has to pay \$90, \$100, or more per ton for its nitrates.

Secretary WEEKS. About \$40, I think.

Mr. HULL. During the war they paid \$90.

Secretary WEEKS. It is about \$40 now.

Mr. JAMES. Section 11, Mr. Secretary, enumerates the things that Mr. Ford is willing to buy, and which cost us \$85,000,000. You figure the salvage value at \$8,000,000 and you say that possibly they might sell for as much as \$16,000,000. Under section 12 Mr. Ford agrees to pay \$5,000,000. I understand that you feel that in view of Mr. Ford's offer to manufacture nitrates and fertilizer, Congress should accept the proposition, although there is quite a difference between your figures and his?

Secretary WEEKS. I think the Government is making a sacrifice in selling at \$5,000,000. I tried to get Mr. Ford to pay the salvage value on the property. He has declined to make any change in the amount he will pay for it. There are so many contingencies and benefits that result from this that it is a question for Congress to decide whether it can afford to make a monetary sacrifice in the sale of its property, but in any case you should remember that the salvage includes the salvage of nitrate plant No. 2, which I would not be in favor of doing at all. There the Government has a complete plant which can now produce, by using steam power, without any development of waterpower, about 100,000 tons of ammonium nitrate a year.

Mr. JAMES. What would be the salvage value without the nitrate plant?

Secretary WEEKS. Those figures are given in detail in Gen. Williams's report. Let me add a word here, so that it may clarify the statement I have made. The Government is now equipped to produce nitrates for its purposes through the use of this nitrate plant No. 2. Under present conditions it would have to operate the plant by steam power, which, of course, would be more expensive, presumably, than to operate by waterpower, and there is an advantage in that the steam plant is kept in condition all the time, so that regardless of Mr. Ford's or any other offer the Government has that property now and can produce in any year it wishes to, 100,000 tons of ammonium nitrate.

Mr. KEARNS. Mr. Secretary, I think the answers to all the questions I would like to ask you are in this document we have before us, but in order to assemble them, I would like to ask you a few questions. How much money has the Government already expended in the entire project at Muscle Shoals?

Secretary WEEKS. Including maintenance?

Mr. KEARNS. I mean including everything.

Secretary WEEKS. You want that figure definitely?

Mr. KEARNS. Approximately.

Secretary WEEKS. That amount is \$106,203,016.07. That includes maintenance to July 1, 1921. Incidentally, I want to say a great many statements have been made about the cost of carrying on those plants now, as being \$700,000 a year, or figures to that effect. That has been modified in the last year, we having leased the Warrior plant and the power plant No. 2, and my opinion is that we are getting enough out of those two leases to pay the expenses we are going to be put to there so that we are probably breaking even at this time.

Mr. KEARNS. If the Government should enter into this contract or lease with Mr. Ford, and should complete this project, how much would the additional cost amount to?

Secretary WEEKS. It would be from \$40,000,000 to \$50,000,000 more. That would make a total of approximately \$150,000,000.

Mr. KEARNS. After the work was all completed, on what sum of money would Mr. Ford pay rental?

Mr. WEEKS. On whatever the additional cost of completing Dams No. 2 and No. 3 may be, and the equipment of those dams.

Mr. KEARNS. Then the Government would get no rental from the money already expended down there?

Secretary WEEKS. No, sir.

Mr. KEARNS. Does Mr. Ford propose to finance the completion of this entire project down there?

Secretary WEEKS. He expects to contract to construct the dams, and the Government to furnish the money to do it, and the terms on which the interest payments are to be made are stated clearly in his offer.

Mr. KEARNS. If the Government should enter into this lease with Mr. Ford and he should undertake to produce fertilizers and should fail, what would become of the plant?

Secretary WEEKS. He makes the offer for the whole or nothing. I asked him if he failed to manufacture fertilizer if that would mean—I asked in various terms—if that would mean the cancellation of the balance of the contract, that is, relating to the power obtained from the dams, and he said not at all, that his offer included everything, and that he did not expect, at that time, to manufacture fertilizer unless he could do it at a profit, but his modified offer does modify that statement.

Mr. KEARNS. If this lease should be granted to him, there is no assurance then that he would continue the manufacture of fertilizer throughout the term of the lease, that is, there is no proposition on his part that he shall give bond or any kind of a guaranty to that effect?

Secretary WEEKS. No; he apparently attempts to put himself and his estate behind the company which he forms.

Mr. KEARNS. But not agreeing to manufacture fertilizer throughout all of the lease period?

Secretary WEEKS. I do not think it is quite in businesslike shape in that respect.

Mr. KEARNS. In connection with the manufacture of fertilizer he intends to furnish power to certain corporations and individuals in that section of the country, does he not?

Secretary WEEKS. I do not know. That is entering into a question which is problematical. I have been told he intends to establish industries there that would make use of the power later. He might have some power to sell, and that is the reason why I put in the proposition that if it were sold it should be sold under the direction of the Federal Waterpower Commission.

Mr. KEARNS. Under the terms of the lease as submitted by Mr. Ford, he would have a right to furnish power to any one to whom he saw fit to furnish it?

Secretary WEEKS. Undoubtedly.

Mr. KEARNS. He would have the right to cease the manufacture of fertilizer the moment he might see fit?

Secretary WEEKS. That is clearly stated, I think, in paragraph 14 of the Ford offer.

Mr. KEARNS. In your opinion, would he be required under the provisions of the agreement to produce fertilizer during the life of the lease?

Secretary WEEKS. If you will look at page 10 of my comment, in the second paragraph you will see that I say, "If Mr. Ford's proposal be accepted by Congress, I suggest that there should be certain modifications made to safeguard the Government's interests. As heretofore stated there should be some assurance that the contracts made by his proposed company will be carried out."

Mr. KEARNS. What guarantee could he give that would live through the period of 100 years, or the life of this company, for the manufacturer of fertilizer?

Secretary WEEKS. He could provide the company with sufficient capital so that its failure to do so would mean a large financial loss, or he could give a bond.

Mr. KEARNS. The Alabama Power Co. claims to have had some option granted by the Government on the rental of this project. What amount of money, if any, did they pay the Government for this option?

Secretary WEEKS. You mean the Alabama Power Co.?

Mr. KEARNS. Yes.

Secretary WEEKS. I have a letter here dated the 28th of May, 1921, from the president of the Alabama Power to Gen. Beach, the Chief of Engineers, which gives the full history of this company's connection with that project. They have spent a good deal of money there in the preliminary operations, and I do not think it would be unreasonable, Mr. Chairman, to ask that this letter be put into the record.

Mr. KEARNS. I think it ought to be in the record. Do they claim they received this option?

The CHAIRMAN. If there is no objection, the letter referred to by the Secretary will be inserted in the record at this point.

(The letter referred to is as follows:)

ALABAMA POWER CO.,
Birmingham, Ala., May 28, 1921.

Maj. Gen. LANSING H. BEACH,
Chief of Engineers, Washington, D. C.

DEAR SIR: We duly received your communication of April 2, 1921, inquiring what arrangements can be made to derive a reasonable return upon the investment if the Government completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River, and you invite a discussion of the matter if we are interested.

We have given the subject of your letter careful consideration since its receipt and wish to make a reply as follows:

1. The site at which the dam is being constructed on the Tennessee River was purchased by our company in 1906, and from that time until 1919, a period of 12 years, we expended large sums of money in making studies, exploring foundations, and in the purchase of reservoir lands, with the view of its development as an integral part of the hydroelectric system which would be required to meet the needs of the communities which the company proposed to serve from time to time. It was our plan to construct storage reservoirs and to connect them with the proposed Muscle Shoals development to make up the deficiency in power at the latter place during seasons of low water. This fact alone would have enabled this company to plan for an ultimate installation at Muscle Shoals largely in excess of the installation that should be made as an independent, separate development. In short, our plans were adapted to fully conserve and utilize in the public interest the navigation and water resources of the region.

2. In the meanwhile we acquired other power sites in Alabama, and under an act of Congress of 1907 constructed a dam and power plant on the Coosa River, a smaller hydro plant on a nonnavigable stream, and several steam plants at different points on our system, with a total capacity of 177,400 horsepower (not including the Government steam plant at Warrior). This system embraces about 1,500 miles of high-tension lines over which we are distributing energy to the public in more than two-thirds of Alabama, including one of the greatest industrial and mining districts in the country.

3. During the same period engineers of the United States were investigating the project pursuant to the direction of Congress. A special board of engineers was created for the purpose of obtaining information and estimates relative to the coordination of proposed improvements for navigation and water power, and that board invited bids for cooperation by water-power interests in the proposed development. This company, through its subsidiary, Muscle Shoals Hydroelectric Power Co., submitted a plan in response to that invitation of the United States engineers. Plans were also submitted by others, but upon careful investigation the special board recommended that Congress undertake the improvements in cooperation with this company, and that recommendation was concurred in by the Board of Engineers for Rivers and Harbors and by the Chief of Engineers. Believing that this was an economical and profitable undertaking, we were prepared under the conditions then existing to proceed with our share of this undertaking, and if this recommendation had been favorably acted upon, the project would have been available for the manufacture of nitrates during the war period, and many millions of dollars would have been saved.

4. A further examination and survey of the project was made by the engineers of the United States in compliance with the provisions of the River and Harbor Act approved March 4, 1915. Recommendation was again made that the improvements be undertaken in cooperation with this company, but the engineers further recommended that action be suspended until it should be determined whether the Muscle Shoals power would be utilized for a nitrate plant under the act of Congress of June 3, 1916. (Doc. No. 1262, 64th Cong., 1st sess., 1916.)

5. We are adverting to these matters in order that you may see that we were for a number of years interested in working out a feasible plan for the development of the Muscle Shoals power for general industrial use on lines of coordination with improvements for navigation. However, in 1918-19, this particular site was selected for development by the United States to supply power for a nitrate plant; and as it seemed that the United States needed to go forward quickly in its war program to make provision for nitrates, we concluded, as the result of various conferences with representatives of the Government, to donate to the United States the dam site and other lands owned in fee by this company, leaving entirely to the Government the question of any plan for future cooperation with the United States. This donation was made and we received from the United States its voucher for the sum of \$1, being the nominal con-

sideration expressed in the deed. As you may recall, the donation was accepted in behalf of the United States by the Secretary of War under date of February 20, 1918, who expressed the thanks of the Government for the company's action in so donating the property. The property thus donated represented on our books a total investment by this company, to the time of the donation, of approximately \$476,000, but we desired to be helpful to the Government in its war program and made the donation in that spirit. From that time until the receipt of your letter, we have taken no action with regard to the Muscle Shoals project other than the interest common to every patriotic citizen to encourage the progress and development of the Tennessee River Valley and the contiguous country.

6. We do not wish to suggest a course contrary to the expressed purpose of Congress that all of the Muscle Shoals power shall be used in the manufacture of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizer and other useful products. Practically all of the electrical power used in industrial and mining operations in Alabama is furnished by this company, in addition to which we supply the lighting and other municipal requirements in more than two-thirds of the State; and if in the wisdom of Congress all of the power at Muscle Shoals should be reserved for nitrate purposes, or applied to any other use considered to be of greater benefit than the public service rendered by this company, we will continue our program to develop other water powers as the public needs may require.

7. We therefore wish to mention the following difficulties in the way of making any suggestion at this time which will be of substantial assistance to the Government in dealing with its problem at Muscle Shoals:

(a) Section 124 of the national defense act of June 3, 1916, under which the Muscle Shoals dam and water power plant are being constructed, contains the following clause:

"* * * The plant or plants provided for under this act shall be constructed and operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital. * * *"

This, of course, presents a serious legal question as to the authority of Secretary of War, the Federal Power Commission or other agencies of the Government to deal with the project without further legislation by Congress. In addition, funds must be provided and the delay and uncertainty of action by Congress is a very serious element in any proposal.

(b) This company is not advised as to the extent to which the Government is disposed to consider a portion of the investment as being due to war emergency; or what portion may properly represent its power supply for nitrate purposes, in addition to which it is assumed that a portion will be charged to the improvement of navigation of the Tennessee River. These are vital considerations, inasmuch as excessive costs would burden the entire future of the power development, increase the cost of power to consumers, and tend to discourage industrial enterprises which, with low power costs, should supply a market for a part of the Muscle Shoals power.

(c) This and other power companies engaged in public service are in duty bound promptly to find and develop sources of power at the lowest practicable cost to supply the rapidly increasing demands of the communities served. These demands are at this moment most insistent. To fulfill its immediate requirements this company has applied to the Federal Power Commission for a license and is about to construct an important additional hydroelectric development on the Coosa River. While it is true that the power thus secured will be completely absorbed and new sources required by the time the Muscle Shoals dam could be completed, yet the difficulties above mentioned and the doubt which arises from the apparent reluctance of Congress to sanction an arrangement of cooperation, as shown by the clause of the act of 1916 above quoted, suggest that this company would scarcely be justified in depending upon Muscle Shoals to take care of even more remote demands, which are certain to arise and which must be prepared for well in advance.

8. If the above difficulties and uncertainties can in any manner be cleared up, and excessive costs avoided by fair charges to war emergency, power for nitrate purposes, and improved navigation, this company is of the opinion that the development can go forward and be completed with the view of the sale and distribution of a sufficient volume of power therefrom by this company and other companies engaged in public service in the territory adjacent to this development to enable the United States to derive a reasonable return upon such part of the investment as may be properly allocated to the power feature of the project.

9. Our company, together with adjacent power companies, possesses the necessary organization for the distribution of the power to the public; and while the principal markets in the South are now served by those companies, their transmission systems would have to be supplemented by new lines and other equipment to market

this power. The power systems in the southeastern States are now interconnected and the advantage to the public of such interconnection was the subject of a careful survey by eminent engineers acting under your direction, and the subject is thoroughly discussed in a report prepared in the office of the Chief of Engineers by Col. Charles Keller and now printed as an official document entitled, "The Power Situation During the War."

We are inclosing with this letter further excerpts from that report which discuss at length the Muscle Shoals development. (See page 792.)

10. It will require much consideration and study to enable us to present any definite commitment, and would, furthermore, require a more definite statement as to when the power would be available and as to just what portion of the cost would be accepted as the investment in the power project; these being elements which you will appreciate are vital in determining a course in the matter so far as our ability is concerned to take the power at a price affording the United States a reasonable return.

We may add, however, that during our connection with the project, as shown by our formal proposals in response to the Government's invitation (Docs. Nos. 20 and 1262), we regarded the construction of a power dam (at reasonable costs and on commercial plans) at this locality as both a practicable and profitable undertaking; and if there is a possibility that the Government will wish to have any part of the power used in a practical way for commercial purposes, then we would like to urge now that some disposition of the matter be made as early as possible as you can appreciate that in its present status it is a disturbing feature in the industrial situation in this section.

If, therefore, authority is conferred by Congress to conclude a contract for the use of any part of the power by power companies, we wish to assure you that we are ready to work out a mutually satisfactory arrangement looking to the completion of the dam and the disposal of such part of the power as Congress wishes to place in commercial use; desiring now, as at all times in the past, to cooperate in every way desired by the United States in working out the matter.

Yours, very truly,

ALABAMA POWER CO.,
By THOS. W. MARTIN, *President*.

Mr. KEARNS. Does this company claim in this letter that this option was granted them because of the money they had expended in the preliminary construction of that plant?

Secretary WEEKS. In effect, I should think so.

Mr. MILLER. Mr. Secretary, there are six units in which the Government is interested, as I understand it, five of which are completed, that is, Dam No. 2, nitrate plants Nos. 1 and 2, the Warrior plant, and the Waco quarry.

Secretary WEEKS. And the transmission line. You do not understand that the dams are completed?

Mr. MILLER. No. In referring to the numbers of those dams some of us have been a little bit confused. Is there a dam No. 1 at Muscle Shoals?

Secretary WEEKS. I would like to have Gen. Beach explain that when he makes a statement to you. There is a dam, No. 1, scheduled as a part of the whole Muscle Shoals navigation project.

Mr. MILLER. Then Dam No. 1 has no relation to these negotiations?

Secretary WEEKS. No; that is a navigation project.

Mr. MILLER. I notice the Warrior steam plant is 88 miles southeast of nitrate plant No. 2.

Secretary WEEKS. Yes.

Mr. MILLER. There is a transmission line running there, is there not?

Secretary WEEKS. Yes. The Government constructed the transmission line on land that belongs to the Alabama Power Co.

Mr. MILLER. Are there any negotiations pending; is that entirely above there, or are there easements or rights of way to be acquired?

Secretary WEEKS. That land is not paid for.

Mr. MILLER. About how much would be the outlay for completing the transmission line from the Warrior steam plant to nitrate plant No. 2—that is, 88 miles?

Secretary WEEKS. You mean to clear the title?

Mr. MILLER. Yes.

Secretary WEEKS. That has never been figured, I am informed.

Mr. MILLER. It would be a substantial sum, would it not?

Secretary WEEKS. It is through comparatively wild country, but it would be a substantial sum, because of the distance of 88 miles.

Mr. MILLER. At the present time the Warrior plant is leased to the Alabama Power Co. for \$75,000 a year?

Secretary WEEKS. Yes, that was our return for the calendar year 1921.

Mr. MILLER. Figuring on the basis of \$4,605,000 that your report gives as the cost that would be between $1\frac{1}{2}$ and $1\frac{1}{2}$ per cent of the cost?

Secretary WEEKS. That is leased on the basis of $1\frac{1}{2}$ mills per kilowatt hour, and they used enough power last year to provide a revenue of \$75,000.

Mr. MILLER. That is between $1\frac{1}{2}$ and $1\frac{1}{2}$ per cent of the cost of that plant?

Secretary WEEKS. Yes.

(Thereupon the committee took a recess until 2 o'clock.)

AFTER RECESS.

The committee met, pursuant to recess, at 2 o'clock p. m.

The CHAIRMAN. The Secretary has not yet arrived, and while we are waiting for him I will have the clerk of the committee read a letter which I have received from the American Farm Bureau Federation through Mr. Silver, who is at the head of that institution, or the representative of the institution in Washington. He asked that the letter be read to the committee. It is a farmer proposition and favors the Ford proposal.

(The clerk read as follows:)

AMERICAN FARM BUREAU FEDERATION,
Washington, D. C., February 7, 1922.

HON. JULIUS KAHN,

*Chairman House Committee on Military Affairs,
House of Representatives, Washington, D. C.*

DEAR MR. KAHN: The American Farm Bureau Federation desires to present to you the following statements which we would ask that you have read before your committee when it meets. It is not a brief but a practical statement of a business situation involving our interests in the Muscle Shoals development. We are making this request because we feel sure that you and your committee will sympathize with our position and desire to have this statement at the outset of your considerations.

As Washington representative of the American Farm Bureau Federation I desire to present to the committee a copy of the resolution adopted at our last annual convention in Atlanta, Ga. Also, I desire to present a copy of the resolution adopted without a dissenting vote by the agricultural conference called by the administration and held here the last week in January.

(Resolutions follow.)

We have indorsed the Ford proposal and urge its acceptance in good faith. The suggestions made by the Secretary of War are not new objections and have been presented by opponents of the proposal, all of which have been considered by us before arriving at a conclusion on this broad question. We believe that this proposal offers a solution to the Muscle Shoals question that will provide for the completion of the development of the project to the best interests of the people of the Nation, with the Government's need for explosives safeguarded, and secure the results sought by agriculture.

In connection with the appropriation suggested as necessary to carry out the Ford proposal, we wish to submit a copy of the letter we addressed to the Secretary of War on January 9 recommending a bond issue to cover the additional investment necessary. We wish to advocate the same proposal for your consideration.

There are no further comments on the Ford proposal that we desire to make at this time. However, I desire to request for the interests I represent that should arguments be presented that raise doubts in your mind as to the advisability of accepting the offer, that we be heard.

The Secretary of War has recommended as an alternative the completion of the Wilson Dam for "commercial purposes, the benefits to navigation, as well as the possible needs of the Government" and that the "Government may itself undertake to sell the produce to the best advantage." He goes on to point out that by not completing the full development the Government will only be required to expend \$22,000,000. This Government completion and operation of the Wilson Dam will not furnish navigation without completing No. 3 Dam and entirely disregards the nitrate plants and makes no suggestion as to their operation. Obviously, the "product" of the Wilson Dam which is to be sold "to the best advantage" is not fertilizer, but power. This thought is further emphasized by the Secretary's suggestion to progressively install the power machinery as the power is disposed of.

We can not believe that your committee would report to Congress in favor of completing the Wilson Dam and not provide for the farmers at least an equal opportunity to secure the operation of the nitrate plant and the research provided for in the Ford proposal. And we ask that in case the Ford proposal is rejected and you decide to carry

out the recommendation to appropriate the necessary money to complete the Wilson Dam as a Government activity, that you will include some plan for the Government operation of the nitrate plants such as was before the last Congress in H. R. 10329, the Kahn bill, and which passed the Senate, and at the same time authorize the appropriation of the needed amount, at least \$12,500,000, which was carried in this bill for the purpose of operating the plant and carrying on research provided in the Ford proposal. The above states our position as expressed in the Atlanta resolution, and we must endeavor to safeguard our interests in any authorization for the completion of the Wilson Dam by amending it with the Wadsworth-Kahn bill or an equally efficient alternative, carrying at the same time the necessary appropriation.

We wish to make plain our position. We are for the acceptance of the Ford proposal. We believe the Government interests and ours are mutual and amply safeguarded in that proposal and we believe it will prove a solution of the Muscle Shoals problem. Our contentions for Government operation are to be considered solely in case you decide against accepting the Ford proposal now before you, and in such case we must ask for extended hearings on this question of the operation of the plant, and will need a reasonable amount of time to prepare our case.

I respectfully request you to present this statement to the committee and feel confident you will appreciate our position.

Very truly, yours,

AMERICAN FARM BUREAU FEDERATION,
GRAY SILVER, *Washington Representative.*

(The two resolutions referred to follow:)

RESOLUTION IN REGARD TO MUSCLE SHOALS, PASSED BY THE AMERICAN FARM BUREAU FEDERATION AT THE ANNUAL CONFERENCE AT ATLANTA, GA.

We recognize in the Muscle Shoals nitrate water-power project in Alabama such an essential measure to secure the preservation of our soil resources as well as to develop the industrial and transportation facilities of our Nation, that we urge the Congress of the United States to authorize the Secretary of War to enter into such contract or contracts with Henry Ford for the completion and continuous operation of the project as will protect the public welfare. If such authority is not promptly given, we reserve the right to institute such action as will guarantee the completion and operation of this enterprise under Federal supervision.

RESOLUTION ADOPTED IN REGARD TO MUSCLE SHOALS AT THE AGRICULTURAL CONFERENCE CALLED BY SECRETARY OF AGRICULTURE WALLACE AT THE REQUEST OF PRESIDENT HARDING.

Resolved, To accomplish results without any further delay whatsoever, we urge the Secretary of War to recommend and the Congress to accept Henry Ford's proposal to take over the hydroelectric power and air nitrate plant at Muscle Shoals under a guaranty to operate same for 100 years, at its present capacity of approximately 100,000 tons of ammonium nitrate per annum, opening the Tennessee River to navigation, cheapening the production of fertilizer, metals, and other commodities and assuring the United States nitrogen independence in peace or war.

**STATEMENT OF HON. JOHN W. WEEKS, SECRETARY OF WAR—
Resumed.**

The CHAIRMAN. I think when we adjourned, Mr. Secretary, Mr. Miller was asking you some questions, and we will proceed from that point.

Mr. MILLER. Mr. Secretary, according to Mr. Ford's offer there is a governmental investment here of between \$105,000,000 and \$106,000,000, out of which we will get nothing whatever except the \$5,000,000 offered for the plant.

Secretary WEEKS. Substantially that is correct.

Mr. MILLER. In other words, there is \$12,887,941.31 invested in plant No. 1, \$70,979,851 in plant No. 2, \$4,979,000 in the Warrior plant, and \$52,000 in the Waco quarry, and \$16,251,000 in the Wilson Dam, making a total of \$105,943,000, as I figure it. Now, we will get no amortization or anything out of that?

Secretary WEEKS. No; except as \$49,000,000 may exceed the cost of future constructions and of site and flowage rights.

Mr. MILLER. Then we have that much of a dead investment there; we will get amortization, though, on what it will cost to complete the Wilson Dam?

Secretary WEEKS. Yes.

Mr. MILLER. And the installation of Dam No. 3, which will be approximately \$50,000,000?

Secretary WEEKS. Yes; that means completion of the two dams and equipping them.

Mr. MILLER. In other words, then, we have a dead investment there from which the Government will get nothing, of \$105,000,000 or \$106,000,000.

Secretary WEEKS. Except \$5,000,000.

Mr. MILLER. Yes; except \$5,000,000. By the way, will not the major portion of that \$5,000,000 be absorbed in paying for the overflow damages in connection with Dam No. 3 and the completion of the transmission line from the Warrior plant?

Secretary WEEKS. I think about \$1,500,000 will be absorbed in paying for the land damages and overflow damages from Dam No. 3; probably as much as that.

Mr. MILLER. Your engineers estimate it in your report at \$2,000,000.

Secretary WEEKS. Yes.

Mr. MILLER. Now, it will cost a substantial amount to complete the transmission line and the easements and the right of way from the Warrior plant to nitrate plant No. 2.

Secretary WEEKS. Just how much that will cost no one knows.

Mr. MILLER. But that amount, whatever it is, and the overflow damages on Dam No. 3 will absorb a large portion of the \$5,000,000 that Mr. Ford pays for the plant.

Secretary WEEKS. A considerable portion of it; yes.

Mr. MILLER. In other words, our \$5,000,000, or the major portion of it, is gone, and that would leave \$105,000,000 or \$106,000,000 out of which we would get nothing. Just for the purpose of getting the matter geographically located, on which side of the river are these plants, or are they on each side of the river?

Secretary WEEKS. All of the holdings are on the south side of the river.

Mr. MILLER. The river, then, must flow in a southwestern direction, because you say that nitrate plant No. 1 is 6 miles southwest of Dam No. 2, and nitrate plant No. 2 is 2 miles northeast of nitrate plant No. 1.

Secretary WEEKS. Yes.

Mr. MILLER. None of these transmission lines have to cross the river?

Secretary WEEKS. No.

Mr. MILLER. There are apparently two angles to Mr. Ford's proposition; one is the manufacture of commercial fertilizer and a standby for the production of ammonium nitrate, and the other is the sale of waterpower.

Secretary WEEKS. Yes.

Mr. MILLER. There will probably be in the vicinity of 500,000 horsepower for sale by the completion of the two dams, will there not?

Secretary WEEKS. The horsepower on the Tennessee River is very irregular.

Mr. MILLER. I understand that.

Secretary WEEKS. There will be developed there about 140,000 horsepower primary power; perhaps 150,000 more that is available from 10 to 12 months of the year, and the balance, 560,000 horsepower, a lesser time, from 4 to 10 months, a total of 860,000 horsepower. It depends on the season, of course, and the condition of the water, but only about 140,000 horsepower can be counted on as primary power.

Mr. MILLER. That is, at all seasons of the year?

Secretary WEEKS. At all seasons of the year; yes.

Mr. MILLER. In any event, if the Government should go on and complete Dam No. 2 and not install Dam No. 3, and sell the water power, has the Government any transmission lines or would we have to construct those in order to distribute this power throughout the communities there?

Secretary WEEKS. You would have to construct more or less lines, but my judgment is that that would not be a very difficult matter, because there are several power companies operating in that general section of the country, and you could either use their lines or sell the power to them, or in some other way dispose of it.

Mr. MILLER. I had understood that a rather peculiar situation obtained there, and that the Alabama Power Co. had practically a monopoly of transmission lines in that part of the country, and that the construction of additional lines would be almost prohibitively expensive.

Secretary WEEKS. I do not think that is true.

Mr. MILLER. The natural purchaser of this surplus hydroelectric power would be the Alabama Power Co. and have it distributed over its lines; is not that true?

Secretary WEEKS. I think the Alabama Power Co. could handle it better than anybody else in that vicinity.

Mr. MILLER. I notice in connection with nitrate plant No. 1 that 19,000 acres of land were acquired and that the plant stands in the middle of that tract of land.

Secretary WEEKS. That should have been 1,900 acres instead of 19,000.

Mr. MILLER. I was wondering how it happened that there should be $5\frac{1}{2}$ square miles of land there.

Secretary WEEKS. That is a misprint.

Mr. MILLER. Does the Government have any royalties to pay on any patent to the General Chemical Co. as a royalty on their process for the manufacture of ammonium nitrate?

Secretary WEEKS. That is one of the agreements that is in controversy. That is a matter that came up for discussion this morning. The Air Nitrates Corporation, I understand, is owned by the American Cyanamid Co. Are you talking about the General Chemical Co.?

Mr. MILLER. I was talking about the General Chemical Co. That relates to plant No. 1.

Secretary WEEKS. Yes; that relates to plant No. 1.

Mr. MILLER. Do we have to pay them any royalty or have we any engagement to pay them any royalty for their process which, I believe, is the Haber process?

Secretary WEEKS. I will read this paragraph of the agreement:

"In so far as the Government shall see fit to employ the said processes or apparatus or any of them in the manufacture of products to be used for fertilizers, the Government shall pay to the General Chemical Co. a royalty for such use. The royalty so to be paid shall be based upon the nitrogen content of the material produced for fertilizer purposes, and shall be at the rate of \$5 for each ton of 2,000 pounds of fixed nitrogen in whatever form combined, and shall be payable quarterly until the 9th day of November, 1932, and thereafter until the expiration of all patents involving any substantial features of the process or apparatus."

Mr. MILLER. Then from now until 1932 we are to pay \$5 a ton as a royalty for the Haber process.

Secretary WEEKS. Yes.

Mr. MILLER. That plant Mr. Ford does not intend to operate, as I understand it.

Secretary WEEKS. I do not understand that he intends to operate it.

Mr. MILLER. Now, on plant No. 2, which is the one that the Air Nitrates Co. constructed, what royalties, if any, do we pay on that?

Secretary WEEKS. I will just read you that paragraph:

"In consideration of the granting of the licenses provided for in article 1 hereof, and of the other conditions to be performed by the licensor, the licensee agree to pay to the licensor during the term thereof specified in said article as royalty an amount equivalent to 6 mills per pound of all nitrogen fixed as lime nitrogen manufactured at the plant hereinbefore described in the contract of even date herewith between the United States and the Air Nitrates Corporation, and to which reference has hereinbefore been made and up to and including the first 91,700,000 pounds of such nitrogen so fixed in any fiscal year of the United States; and in addition thereto, 3 mills per pound of all nitrogen fixed as lime nitrogen in any said fiscal year in excess of the said 91,700,000 pounds of nitrogen, it being further understood and agreed that no party of such royalty shall directly or indirectly inure to the benefit of an alien enemy of the United States except as may appear upon a disclosure of stock lists made pursuant to law. Payment for royalties shall be made each month as early in the month as practicable upon the presentation of satisfactory evidence showing the production during the preceding month of nitrogen fixed as lime nitrogen at the plants hereinbefore referred to."

Mr. MILLER. Then at each of these plants, if we are to pay these respective royalties. I suppose that will become a part of the overhead in the manufacture of the fertilizer.

Secretary WEEKS. Just a moment, and I will add something pertinent to that last statement. The royalty to the Air Reduction Co. until January, 1931, is \$2.72 per ton of nitrogen fixed as lime nitrogen. After that date, there will be no royalties charged.

That is in addition to what I have just read.

Mr. MILLER. Have we paid those companies any royalty? As I understand it, plant No. 1 has never produced anything.

Secretary WEEKS. No royalty has been paid on No. 1 at least. I am told that not in excess of \$1,500 has been paid at No. 2.

Mr. MILLER. I suppose those royalties, whatever they may be, will be a part of the overhead in the manufacture of fertilizer and the United States will not be bound for the payment of those royalties although this contract is with the United States?

Secretary WEEKS. Yes.

Mr. MILLER. That will be a part of the overhead charge if Mr. Ford is to operate the plant and will go into the cost of the fertilizer, is not that the idea?

Secretary WEEKS. I think so.

Mr. MILLER. Has your department made any research as to what proportion of the amount of commercial fertilizer used in the United States will be produced at the Muscle Shoals plant by the full operation of plant No. 2?

Secretary WEEKS. The total production of fertilizer in the United States during 1920 amounted to 7,700,000 tons. The total nitrogen content of this fertilizer probably amounted to 160,000 tons. About one-half of this, or 80,000 tons, was inorganic nitrogen. The No. 2 nitrate plant can produce some 200,000 tons of sulphate of ammonia per year, which contains some 40,000 tons of nitrogen. Or, in other words, this plant can produce about one-fourth of all the nitrogen used in fertilizer or about one-half of the inorganic nitrogen used in fertilizer.

Mr. MILLER. Just for the purpose of information, both of these plants produce ammonium nitrate, plant No. 1 by the Haber process, and Plant No. 2 by the cyanamid process, and the first plant has a production of 22,000 tons a year if operated, and the latter plant 110,000 tons a year if operated. I do not know myself how many tons of fertilizer one ton of ammonium nitrate will make.

Secretary WEEKS. I think you had better ask that question of Gen. Williams or Maj. Clement or somebody who has been giving particular attention to it, because my answer quite likely would not be accurate.

Mr. MILLER. I read some time ago a rather astounding article in an agricultural paper which was to the effect that if the Muscle Shoals plant should be operated and commercial fertilizer manufactured there, and if it was possible to manufacture that fertilizer at a much lower price than fertilizer commands in the market—that is, the Chilean article—that our imports would cease.

Secretary WEEKS. You are speaking of nitrates now.

Mr. MILLER. Yes; and that the American farmer would be wholly dependent upon the Muscle Shoals plant because they could not compete with that. I do not suppose there is any apprehension along that line.

Secretary WEEKS. I have not been called upon to have any apprehension along that line.

Mr. MILLER. The main point, Mr. Secretary, that I was after, was to ascertain whether or not the operation of the Muscle Shoals plant would yield the very beneficial results to the American farmer that he is expecting out of it.

Secretary WEEKS. I wish I could answer that question with definiteness. I do not think any one can, but I am fearful that the American farmer will be disappointed.

Mr. MILLER. In reference to the sale of this surplus hydro-electric power there, in the first place, the navigation of the Tennessee River is inseparably connected with this enterprise down there, is it not?

Secretary WEEKS. If the river is to be navigated, it must be taken into consideration at this time.

Mr. MILLER. Mr. Ford in his proposition sets aside an amount sufficient for the practical operation of the locks at Dams No. 2 and No. 3.

Secretary WEEKS. Yes.

Mr. MILLER. He sets aside a sinking fund from a semi-annual payment of \$3,505 for Dam No. 3, and \$19,868 for Dam No. 2, which placed at interest for a period of 100 years or 97 and 93 years, respectively, would yield about \$49,000,000.

Secretary WEEKS. Yes; that is, at 4 per cent.

Mr. MILLER. Then he agrees further to pay 4 per cent on what it will cost to complete Dam No. 2 and the entire construction of Dam No. 3.

Secretary WEEKS. Yes.

Mr. MILLER. The Government, then, is doing this: It is advancing to Mr. Ford Government money at 4 per cent, also giving him the benefit without anything in return of over \$17,000,000 that we have expended on Dam No. 2. That is right, is it not?

Secretary WEEKS. Yes.

Mr. MILLER. Now, on an enterprise which I guess we are all in a position to admit now is going to be of no practical benefit to the farmer, or at least not the benefit he thinks it is going to be, the Government is going into an enterprise of financing Mr. Ford's proposition to the extent of \$50,000,000 more and losing between \$105,000,000 and \$106,000,000, that we get nothing out of it, and giving him the benefit of \$16,850,000 that we have already put into Wilson Dam No. 2.

Secretary WEEKS. That is included in the figures you mentioned before of \$105,000,000 or \$106,000,000.

Mr. MILLER. That is, the Wilson Dam?

Secretary WEEKS. Yes.

Mr. MILLER. Then it will be cut down to \$86,000,000 or \$87,000,000?

Secretary WEEKS. Yes.

Mr. MILLER. Then we are giving Mr. Ford, or, from the Government's point of view, we are losing entirely the investment of \$85,000,000 that we have in nitrate plant No. 1 and No. 2, the Warrior plant, the Waco quarry, and the \$16,000,000 we have spent on Dam No. 2?

Secretary WEEKS. Well, you do not want to say "entirely."

Mr. MILLER. No; we get \$5,000,000 for it.

Secretary WEEKS. Yes.

Mr. MILLER. Which, as we have seen previously, will be almost wholly absorbed in paying the overflow damages on Dam No. 3 and the completion of the Warrior power plant.

Secretary WEEKS. Partially absorbed.

Mr. MILLER. The fact of the matter is the United States Government is getting nothing out of this thing, as I see it.

Secretary WEEKS. The United States Government is getting two or three things out of it which you have not called attention to.

Mr. MILLER. We are getting this plant as a stand-by in case of war to make ammonium nitrate for war purposes.

Secretary WEEKS. Mr. Ford is to keep in condition for operation the nitrate plant No. 2 for the use of the Government. It would cost about \$2,500,000 for the locks at the Wilson Dam. That is included in the cost on which Mr. Ford, as his proposition now stands, will pay interest at 4 per cent. So that the Government gets those two benefits. Then, if Mr. Ford is going to develop industrial business there, which I should think he would be able to tell and be willing to tell the Congress, it is of moment to the people of the country to have developed industrial business, and I think those things should be taken into account.

Mr. MILLER. Yes; that is an indirect benefit; there is no question about that; but so far as the United States Government is concerned, Mr. Secretary, if we should tell Mr. Ford to-day, "We will make you a present of the Waco quarry, the nitrate plants No. 1 and No. 2, the Warrior steam plant, and what we have put into the Wilson Dam, provided you will complete the Wilson Dam and furnish the money yourself, and keep nitrate plant No. 2 in readiness for war emergency," the United States Government would be ahead in the transaction, would it not?

Secretary WEEKS. I do not think the United States Government, as a Government, is at all interested in Dam No. 3.

Mr. MILLER. I did not say Dam No. 3; I said Dam No. 2.

Secretary WEEKS. Of course, if Dam No. 2 is constructed, and electrical power is furnished to run the nitrate plant in case the Government needs to operate it, it would be very much cheaper than steam power.

Mr. MILLER. But what I was getting at, Mr. Secretary, is that if the United States Government should say to Mr. Ford, "We will give you nitrate plants Nos. 1 and 2 out and out, we will give you the Warrior steam plant, we will give you the Waco quarry, we will give you what we have put into the Wilson Dam, which is \$16,000,000, if you will go on and complete the Wilson Dam and pay us the amount of rental at 4 per cent on what has been put into it," the United States Government would be ahead on the deal; that is, it would be better for the United States Government than the present proposal.

Secretary WEEKS. I do not think it would be very much ahead, and I do not think it would be very much behind.

Mr. MILLER. Then we are practically giving this proposition and financing it for 100 years at 4 per cent.

Secretary WEEKS. Yes; but you are getting your money back.

Mr. MILLER. We get our money back at the end of 100 years, five generations off, when we will all be dead and gone.

Secretary WEEKS. You know that I want to get it back in half that time.

Mr. MILLER. Yes; I understand you favor 50 years.

Secretary WEEKS. May I call your attention to the fact that a navigation project is being developed in connection with the development of the dam, and in connection with that navigation project the man who is making the development pays interest on the cost and returns the money.

Mr. MILLER. That is right, but would the navigation of the Tennessee River be possible without the completion of the projected Dam No. 1? Suppose we go ahead and build Dam No. 2, as Mr. Ford wants us to do, how about the navigation of the Tennessee River?

Secretary WEEKS. I should have to ask Gen. Beach or Gen. Taylor to testify exactly as to that.

Mr. MILLER. Is it your understanding that the Tennessee River will be rendered perfectly navigable without the construction of Dam No. 1?

Secretary WEEKS. I do not think it can be. Of the expenditures on Dam No. 2, up to this time, \$500,000 is allotted to navigation, and it will cost about \$2,500,000 to complete the locks.

Mr. MILLER. Then from the standpoint of aiding navigation on the Tennessee River, we will have to complete a third dam, will we not?

Secretary WEEKS. Yes; to complete it, but just exactly what that would cost or how much would have to be done there, I can not say.

Mr. MILLER. Then take the three propositions—the fertilizer, the navigation of the Tennessee River, and the sale of surplus power—in order to get the fertilizer production, we have got to put in \$50,000,000.

Secretary WEEKS. You will be told by these engineers that the cost of making the river navigable over Muscle Shoals, if the dams are not constructed, will approximate \$8,000,000. The navigation, however, would not be as good as that created by the dams.

Mr. MILLER. The three elements I have mentioned are the three elements involved in this project at Muscle Shoals, as I see it.

Secretary WEEKS. They are a part of it.

Mr. MILLER. Absolutely, and you can not separate them, as I see it, because Mr. Ford makes an allowance of \$35,000 a year for the operation of one of those locks, and if there was no navigation, of course, there is no outlay there, and he has \$35,000 of velvet in that item alone.

Secretary WEEKS. I am not so sure about that. I am not so sure but what the Government would get that \$35,000 if one rowboat went through there.

Mr. MILLER. Mr. Secretary, I notice at the bottom of page 4 you say that the Waco quarry was acquired at a cost of \$52,962 and comprises 460 acres of land.

Secretary WEEKS. Yes.

Mr. MILLER. Now, turning over to page 20 of your report, I see that the Ordnance Department claim that what we paid \$52,000 for can be scrapped for \$102,000.

Secretary WEEKS. That is the figure, but that includes the equipment. The quarry has been equipped since that time.

Mr. MILLER. We have built a railroad from the Waco quarry up to nitrate plant No. 2, have we not?

Secretary WEEKS. The Government did build a spur back there about 1 mile long.

Mr. MILLER. Then we installed, I daresay, some very expensive equipment at Waco quarry—rock crushers, and things of that kind.

Secretary WEEKS. I have no doubt but what it is adequate.

Mr. MILLER. I notice an item of the "Drifton Railroad," on page 20. Is that the 1-mile road you refer to or the spur track that you refer to?

Secretary WEEKS. No; that is not the road to which I referred. That is a special road that was put into the Warrior plant.

Mr. MILLER. The purpose of the erection of this Warrior plant, 88 miles distant from nitrate plant No. 2 and the dam at plant No. 2, was for the purpose of putting the steam plant near the coal mines where fuel would be readily available?

Secretary WEEKS. Yes; that was the purpose.

Mr. MILLER. Does the Government own that coal mine?

Secretary WEEKS. No, sir.

Mr. MILLER. The Government buys its fuel there?

Secretary WEEKS. That is what the Government would have to do.

Mr. MILLER. That plant is being leased now to the Alabama Power Co. for \$75,000 a year, which is between $1\frac{1}{2}$ and $1\frac{3}{4}$ per cent of the cost of the plant.

Secretary WEEKS. That is what the plant netted last year, \$75,000, based on the amount of power they used.

Mr. MILLER. How long a lease is that, may I ask, Mr. Secretary?

Secretary WEEKS. For the life of contract T-69 and until the Government shall dispose of the plant.

Mr. MILLER. I thank you, Mr. Secretary. I think that is all.

Mr. PARKER. Mr. Secretary, I understand that plant No. 2 is useful for war purposes and can be used now with steam power and will be retained even if the dam is not built.

Secretary WEEKS. Undoubtedly.

Mr. PARKER. You spoke of some royalties payable from that plant, but in reading from the paper as to the 6 mills and 3 mills a pound and the other royalties, you did not state who the licensor was.

Secretary WEEKS. One of the licensors is the American Cyanamid Co., and the other is the Air Reduction Co.

Mr. PARKER. You read one that received a royalty of 6 mills a pound.

Secretary WEEKS. That is the American Cyanamid Co.

Mr. PARKER. Are those licenses to the United States or to somebody else?

Secretary WEEKS. They are both made to the United States.

Mr. PARKER. Are they assignable, so that they would go to Mr. Ford?

Secretary WEEKS. That is a question that is somewhat debatable, I think. I would like to have you ask Gen. Hull, the Acting Judge Advocate General, about that subject.

Mr. PARKER. There is nothing in the proposal of Mr. Ford proposing to take over those licenses or anything of the sort.

Secretary WEEKS. In subdivision (a), under section 11, page 16, of Mr. Ford's offer, it says:

"All of the property constituting nitrate plant No. 2 (as officially known and designated), including lands, power plants, buildings, material, machinery, fixtures, equipment, apparatus, appurtenances, tools, and supplies, and the right, license, and privilege to use any and all of the patents, processes, methods, and designs which have been acquired and may be transferred or assigned to a purchaser of nitrate plant No. 2 by the United States, together with the sulphuric acid units now in storage on the premises."

Mr. PARKER. I see from the proposal that he proposes to pay \$5,000,000 for all this property in five installments, and that after he pays \$1,000,000 gets possession, and after he pays the whole \$5,000,000 he gets a deed of conveyance. Of course, that gives him full title with warranty of the title to be good and unencumbered, and nevertheless he agrees after he gets title, seemingly, to operate this nitrate plant No. 2. This is not made a part of the deed. After he has acquired that title, have you anything to prevent him from selling the title to somebody else free of the clauses of this contract?

Secretary WEEKS. The title to No. 2?

Mr. PARKER. Yes.

Secretary WEEKS. He agrees to keep that in condition for 100 years for the use of the Government. I think that would prevent his selling it.

Mr. PARKER. He is to maintain it, but he takes a deed and the title to it first.

Secretary WEEKS. I know, but he can not sell a piece of property which he agrees to maintain for 100 years for the use of the Government.

Mr. PARKER. There would have to be some sort of a reservation by the United States in the deed, I take it. I notice we are to give him a full deed, free and unencumbered. I am speaking now of his proposal and not of your way of carrying it out, because I have no doubt we will get that straightened out, but it seems to me rather odd when a man takes a piece of property under an agreement to maintain it for 100 years, that he should take a deed instead of taking a lease. The deed ought not be effective until the end of the 100 years.

Secretary WEEKS. Mr. Ford declined to consider a lease of that property.

Mr. PARKER. And he would get a full title and the Government would have only a collateral agreement to use it in a certain way.

Is there any navigation now on the Tennessee River?

Secretary WEEKS. At Muscle Shoals.

Mr. PARKER. Through from above Muscle Shoals down, say, to New Orleans.

Secretary WEEKS. There has been some navigation there but there is no navigation now possible on account of the condition of Dam No. 2.

Mr. PARKER. I notice, and I think I am right, that the 4 per cent on the \$50,000,000 which is to be spent on Dam No. 2 and Dam No. 3 and the other payments preliminary to the 4 per cent do not begin until after the dams are completed so that they furnish horsepower.

Secretary WEEKS. There are slight payments commencing at the beginning. Mr. Ford's offer is quite explicit on that subject, but on Dam No. 2 the full payments do not commence until six years after the first 100,000 horse power are available.

Mr. PARKER. Taking up No. 2 first, I notice that he leases the property from the date when structures and equipment of a capacity of 100,000 horsepower are constructed and installed and ready for service—that is, after the completion of the dam; and by paragraph 7 he leases No. 3 for 100 years from the time when 80,000 horsepower is installed and ready for service.

Secretary WEEKS. You will notice in the latter part of paragraph 3, page 15, \$200,000 one year from the date when 100,000 horsepower is installed and ready for service, and thereafter \$200,000 annually at the end of each year for five years.

Mr. PARKER. I notice that covers the five years, but none of those payments is made until after the dam is completed.

Secretary WEEKS. Until 100,000 horsepower has been installed.

Mr. PARKER. And that can not be until the dam is completed.

Secretary WEEKS. No.

Mr. PARKER. And the same thing is true of the other dam, so that the United States get no payment whatever on account of the interest on what it spends until after the dam is completed.

Secretary WEEKS. Substantially, I think, that is correct.

Mr. PARKER. How long will it take to complete Dam No. 2?

Secretary WEEKS. That would depend on the way it is done; but in all probability two years.

Mr. PARKER. How long will it take to complete Dam No. 3?

Secretary WEEKS. I should think probably the construction would take about the same time. Whether the two dams would be constructed at the same time or not, I do not know.

Mr. PARKER. On Dam No. 3 you have to find out about the foundations?

Secretary WEEKS. Nobody knows about that. The plans and specifications are not yet prepared.

Mr. PARKER. Then you do not know how long it will take to complete that dam after you once begin to spend money on it?

Secretary WEEKS. The Army engineers place the time of completion of Dam No. 2 at 40 months. Personally I think that is too much, and if Mr. Ford contracts this work under the direction of the Army engineers, I think it will be done quicker. The time of completion of Dam No. 3 is placed at 36 months.

Mr. PARKER. Does that include the installation of the machinery, etc., for the development of the 80,000 and 100,000 horsepower?

Secretary WEEKS. I think it does. The first 100,000-horsepower machinery is already under contract for Dam No. 2.

Mr. PARKER. During the time of the building of the dams, the United States gets no interest on its expenditures, and after completion for the first five years it gets rather small interest, \$200,000 on \$22,000,000, which is a little less than 1 per cent, for the first five years, is it not?

Secretary WEEKS. It would depend on how much money is already put into it.

Mr. PARKER. I mean when they get to paying interest, after the lease is made and the dam is ready for service, and \$22,000,000 has been spent, they get only \$200,000 a year for the first five years, which is less than 1 per cent on the \$22,000,000.

Secretary WEEKS. That question of interest is covered in the statement on page 22, but you are substantially right in saying that the Government, for the first six years, does not receive any substantial interest on the investment.

Mr. PARKER. After the dam is completed, aside from the time consumed in building the dam.

Secretary WEEKS. And it is true that if this were being done in an entirely business-like way, the interest on construction cost would become a part of the capital of the enterprise on which interest should be paid.

Mr. PARKER. And that is not in this contract?

Secretary WEEKS. That is not in this contract. That would be in accordance with the policy of the Interstate Commerce Commission.

Mr. HILL. Mr. Secretary, there are two things I would like to ask you about. On page 5 of your letter to the Speaker reference is made to the claims of the Air Nitrates Corporation to purchase nitrate plant No. 2 on as favorable terms as those offered by Mr. Ford, and your letter continues by stating that the Alabama Power Co. may make a similar claim in regard to the Warrior plant and lease. I think the committee would be interested to know whether that would seriously interfere with this proposal to purchase. Would there be serious litigation for the Government arising out of the claims of those companies?

Secretary WEEKS. I can not tell how serious it would be. I supposed that the Air Nitrates Corporation had a legal option to purchase. I am informed it has not. That is a matter, however, that will have to be adjudicated, and if you will ask the Acting Judge Advocate General, who is present, Col. Hull, he will answer that question more completely; but undoubtedly it will be necessary for the United States to furnish a title both to plant No. 2 and the Warrior River plant.

Mr. HILL. On page 9 the statement is made in your letter that these properties cost the United States approximately \$85,000,000, and that as scrap they are estimated to be worth \$8,812,000, but that the Chief of Ordnance thinks it might be possible to dispose of the property at \$16,272,000.

Secretary WEEKS. Yes.

Mr. HILL. Mr. Miller asked certain questions about the Ford proposal in reference to the general agricultural interests, and I would like to ask you regarding the Muscle Shoals proposition in its present form, forgetting what it cost, but looking at it simply as it stands at the present time, if the Ford proposition were not favorably received by Congress, purely as a national-defense proposition, has the War Department worked out a recommendation that it would make for the disposition of this plant; that is, purely as a national-defense matter, what would they do with it?

Secretary WEEKS. As far as plant No. 2 is concerned, they would maintain plant No. 2, because that does furnish them the facilities for obtaining nitrates in case of

war up to 100,000 tons a year. Then the United States might conclude to complete Dam No. 2 to obtain the power cheaply and to sell the power in the meantime. I have not very much doubt but what it would sell a considerable part of the balance of the property, and I think I have assurances that it could sell that property at materially more than the estimated scrap value by taking time.

Mr. HILL. If they maintained plant No. 2 for national-defense purposes and sold the rest of the plant, the United States would then retain all the benefits of the defense elements of the situation without the expenditure of any very great amount, would they not?

Secretary WEEKS. Yes.

Mr. WURZBACH. Mr. Secretary, I understand the second proposition of Mr. Ford is based upon the theory that the Government will accept or refuse his proposition, implying that Mr. Ford is not favorable to listening to any counterproposal made by the Government.

Secretary WEEKS. I do not know whether he is or not. Mr. Ford left my office on the 13th of January saying that he would not do several things which he pretty promptly permitted his engineers to put into this contract which is before the committee.

Mr. WURZBACH. You do not think, then, that the failure of the Government to accept his last proposal would mean that he would not consider any counter proposition on the part of the Government.

Secretary WEEKS. I think it is very difficult for Congress to make counter propositions or to agree on counter propositions. I should think, as a practical measure, as far as the Ford proposition is concerned, practically speaking, it is up for acceptance or rejection. If an individual were dealing with Mr. Ford, it would be comparatively easy to make counter propositions.

Mr. WURZBACH. I understand, but do you not think he has put the proposition up to the Government in a way that it does not admit of any counter proposals by the Government, or do you construe it in that way?

Secretary WEEKS. If you think you could get through Congress a counter proposal, which I do not think you could—I think it would be almost a hopeless task—and the counter proposal were better than this, Mr. Ford might accept it.

Mr. WURZBACH. I notice in section 14 of Mr. Ford's last proposal, the company agrees to operate Nitrate Plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes and so on. I wish you would translate that 110,000 tons of ammonium nitrate into fertilizer products. What does that mean?

Secretary WEEKS. That would mean about 200,000 tons, or perhaps a little more, of ammonium sulphate.

Mr. WURZBACH. That is the fertilizer product.

Secretary WEEKS. But I do not want you to get me into a technical discussion of fertilizer products, because I might become embarrassed.

Mr. WURZBACH. This is sort of Greek to me, and I am simply trying to get some information about it. Do you not take it, Mr. Secretary, that that means an obligation on the part of Mr. Ford to agree to this proposal to furnish a certain amount of fertilizer?

Secretary WEEKS. That paragraph says that the company will.

Mr. WURZBACH. That the company will, without reference to the authority of the company to bind itself, but this does mean that this proposal agrees to bind the obligors to the performance of a certain obligation, does it not?

Secretary WEEKS. It agrees that the company that Mr. Ford is going to form will do that.

Mr. WURZBACH. Yes. Now, I have some serious doubts myself about the necessity of requiring Mr. Ford or whoever makes this application to secure the faithful performance of his contract, but do you not think that section 19, which reads as follows. "the above proposals—that includes 14 and all the other sections—are submitted for acceptance as a whole and not in part. Upon acceptance, the promises, undertakings, and obligations shall be binding upon the United States and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors and assigns; and all the necessary contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned," do you not think that that contemplates some further contract upon the part of the Government and also upon the part of Henry Ford to carry out these agreements.

Secretary WEEKS. Oh, undoubtedly, there will have to be other contracts and agreements relating to the details of this subject.

Mr. WURZBACH. To carry out the purposes of this proposal.

Secretary WEEKS. But I should not have raised the query in my comment if I had thought that that was entirely satisfactory from the Government's standpoint.

Mr. WURZBACH. In other words, this proposal of Henry Ford is not supposed to be the final agreement that is to be entered into between Henry Ford and the Government.

Secretary WEEKS. I do not think that he would be willing to say that there should be any essential change in this proposal.

Mr. WURZBACH. But within the limits of this proposal, binding himself and his heirs and assigns, do you not think it was contemplated by Henry Ford that he would be willing to enter into other agreements, the details of which would be set out in the final agreement to protect the Government in the faithful performance of his agreement?

Secretary WEEKS. I should hope he would.

Mr. WURZBACH. Do you not think that section 19 was contemplated by Henry Ford as leaving the way open to provide for the protection of the Government in the carrying out of the obligations undertaken in this agreement?

Secretary WEEKS. Yes; but you must remember, Mr. Wurzbach, that Congress is going to accept or reject this proposal, and if Mr. Ford said that that was satisfactory, and that is what the Government had accepted, I do not see how he could be led into doing something more than he has promised. I am not impugning Mr. Ford's good faith or his intentions, but 100 years is a long time. You are dealing with a corporation that has no fixed capital. You do not know anything about how long Mr. Ford is going to live, or what shape his estate will be in; not that it will not be solvent, I do not mean to suggest that, but in what way it will be tied up, and the only recourse you have here is for the Attorney General to proceed against somebody for damages. Now, that is a difficult matter to settle.

Mr. WURZBACH. Do you not think there would be a natural disposition upon his part, in view of the fact that by the terms of section 19 he obligates and binds himself, his heirs and assigns, to give some adequate protection to the Government to secure the faithful performance of this contract?

Secretary WEEKS. I should think there would be, but if I were making the contract and was responsible to the Government, I would have that guaranteed.

Mr. WURZBACH. Yes; I would, too. Of course, you understand that a proposal of this kind or a preliminary proposal in any kind of a contract could not go into the details of the entire proposition. It would be a general proposition, would it not?

Secretary WEEKS. That question of a guaranty has been brought to Mr. Ford's attention. It is not in his offer.

Mr. WURZBACH. This implies by its very terms that Mr. Ford intended to go into the details of the matter of protecting the Government because it reads:

"The above proposals are submitted for acceptance as a whole and not in part. Upon acceptance, the promises, undertakings, and obligations shall be binding upon the United States and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors and assigns; and all the necessary contracts, leases, deeds and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned."

Secretary WEEKS. Let me turn questioner for a moment, suppose you accepted this offer of Mr. Ford and then you wanted to put a guaranty in there, do you think you would have any right to compel him to make a guaranty?

Mr. WURZBACH. I think the plain implication of this proposition would be that the Government would be entitled to protect itself in this contract.

Secretary WEEKS. I hope that is so.

Mr. WURZBACH. Yes; I hope so, too, because I would not be in favor of it unless there was some security to the Government that these obligations that are undertaken in this proposal were secured to the Government, and I was wondering whether that last section, section 19, did not provide for that very thing.

Secretary WEEKS. That is the reason I raised the query, to bring it to the attention of the committee.

Mr. WURZBACH. Yes; I understand. That is all.

The CHAIRMAN. At this point I will read into the record a telegram I had from Mr. Liebold, private secretary to Mr. Ford. I wired Mr. Liebold to say that the committee would begin its hearings to-day and that the Secretary of War would be before the committee the greater part of the day, but we would like to have Mr. Ford or his representatives present. Mr. Liebold sent me this telegram:

"Your telegram even date received; at this date it is impossible for Mr. Ford to arrange to appear before your committee on the date mentioned; if there is any special information you desire can we not furnish same from here?"

"E. G. LIEBOLD."

I could not very well imagine how we could send a telegram to Dearborn or Detroit on everything we wanted to ask him about, and I therefore sent this telegram:

WASHINGTON, D. C., February 7, 1922.

Mr. E. G. LIEBOLD,
General Secretary to Henry Ford, Dearborn, Mich.:

Telegram received. Committee would like to have Mr. Ford or his representative here in order to answer a few questions which probably he or his representative can answer better than anybody else. There is every disposition on the part of the committee to treat Mr. Ford or his representatives fairly. The Secretary of War will consume a good part of the day on the 8th. We desire to finish the matter with as little delay as possible. Could Mr. Ford or his representatives come on the 9th, 10th, or 11th?

JULIUS KAHN, *Chairman.*

I have had no answer to that telegram.

Mr. WURZBACH. There is just one more question I would like to ask. Mr. Secretary, do you not think that the proposal of Mr. Ford in section 19 especially is consistent with the idea that he intends in the final consummation of this contract to go into the details and make provisions securing his faithful performance of the contract that he enters into by the terms of that contract?

Secretary WEEKS. I hope that is his intention; but with whom is he going to do that?

Mr. WURZBACH. You do not think there is anything in the proposal that is inconsistent with that idea?

Secretary WEEKS. No; but I think it would have been very easy to have put in there what I wanted to put in; that is, either sufficient capital for this company or a guaranty, which would be tangible, that the contract was to be carried out.

Mr. WURZBACH. I think so, too; but you do not think his proposal is inconsistent with the idea of his giving that security, do you?

Secretary WEEKS. I stated before that I had no desire to question Mr. Ford's motives.

Mr. CRAGO. Mr. Secretary, recognizing the fact that as a part of our military policy of preparedness, the Government already has invested this large sum of money in these propositions, and also recognizing the fact, as I have no doubt you do, that it is not well for the Government to engage in any commercial enterprises in competition with individuals, I would like to know your own personal opinion, as a public official and as a man of business and as a patriotic citizen, as to the advisability of Congress accepting this proposition.

Secretary WEEKS. If I thought there was going to be, as a result of this agreement with Mr. Ford, imperfect as I consider it, a material reduction in the cost of fertilizers to the users of fertilizers; if I thought there was a certainty of that, I think, if I were in Congress, I should vote for this proposal; but I am so much in doubt about it that I should hesitate to do it because I think other disposition can be made of this plant, leaving the question of fertilizer out of consideration, which would be of greater advantage to the Government than this particular one.

Mr. FIELDS. Mr. Secretary, from the questions asked you by Mr. Miller a while ago one not familiar with the subject might be led to believe that Mr. Ford is asking the Government to sell him \$36,000,000 worth, or possibly \$105,000,000 worth, of property for \$5,000,000. I will ask you to state what is the estimate in salvage value of the property proposed to be purchased by Mr. Ford?

Secretary WEEKS. That will be found on page 20 of this House Document 167. The estimated scrap value is \$8,812,000. With an operating concern operating it with scrap, the Chief of Ordnance has worked out the value as \$16,270,000.

Mr. FIELDS. The estimated salvage or scrap value as fixed by the War Department is \$8,812,000?

Secretary WEEKS. Yes.

Mr. FIELDS. Therefore Mr. Ford's offer is only \$3,812,000 less than the department's estimated scrap value of the property?

Secretary WEEKS. Yes.

Mr. FIELDS. I notice on page 20, in Exhibit E, an analysis of the cost to the Government by reason of its failure to collect interest during the construction of the Dam No. 2 you have some detailed figures, and I would like to ask at this point that a similar analysis be prepared and put into the hearing as to what the expense would be to the Government if it does complete this work—that is, what the added expense would be, allowing the same rate for interest charges on the capital invested.

Secretary WEEKS. I will have that done.

Mr. FIELDS. I believe you stated earlier in the hearing that this plant, nitrate plant No. 2, is ready for the production of nitrates; that is, nitrates used in explosives, is it not?

Secretary WEEKS. Yes.

Mr. FIELDS. There would be considerable additional expense to prepare this plant for the production of the elements going into fertilizer?

Secretary WEEKS. Yes; but depending altogether on the manner in which the fertilizer was going to be made; I mean the process that was to be used and the amount to be used.

Mr. FIELDS. The amount which is apparently contemplated by the proposition of Mr. Ford is 110,000 tons a year. What would be the additional cost of equipping this plant for the production of that amount of ammonium sulphate?

Secretary WEEKS. If you put in an ammonium sulphate plant to use the entire product the estimated cost would be about three million dollars. Mr. Ford's engineers stated in interviews which I had with them that it was his proposition to invest between ten and twelve million dollars. I do not know exactly how he would invest that, and I do not know that he knows exactly how.

Mr. FIELDS. He would at least have to invest three million dollars before he could begin to produce ammonium sulphate?

Secretary WEEKS. In any considerable amount.

Mr. FIELDS. Before he could get very far he would have to invest about three million to possibly ten million dollars in the equipment of his plant?

Secretary WEEKS. I think so, probably.

Mr. FIELDS. I believe it is stated in House Document No. 167, either in your report, the report of the Chief of Engineers, or the report of the Chief of Ordnance, that it cost \$201,674 to maintain nitrate plant No. 2 in stand-by, idle condition last year?

Secretary WEEKS. Yes.

Mr. FIELDS. Approaching this from the standpoint of preparedness, in which we are all first interested, that is, the members of this committee, if the Government is to maintain this plant for preparedness, its first cost would be \$200,000 a year to maintain it?

Secretary WEEKS. Not necessarily, because we are leasing the steam plant now for \$10,000 a month, plus 2 mills a kilowatt hour for the amount of power used, so that the minimum receipts would be about \$120,000, and the maximum receipts about \$250,000. That is leased for a year, on a revocable lease.

Mr. FIELDS. At least, in computing the charges against the plant, we would first have to consider the cost to the Government of maintaining it, which would be \$200,000 a year?

Secretary WEEKS. Let me correct you on that. I am informed by an officer who is perfectly familiar with the plant that it will cost this year about \$120,000.

Mr. FIELDS. Calling that insurance for preparedness, then, for the life of Mr. Ford's lease, that would run into several million dollars.

Secretary WEEKS. You will note—I do not know that it can be done every year, but we will get out of the Warrior plant and this plant at least \$300,000 this year, and quite likely as much as \$400,000. Three hundred thousand dollars would be 6 per cent on the entire amount that Mr. Ford is to pay us.

Mr. FIELDS. This item of expense you refer to covers not only maintenance but the upkeep, repair, etc., of the plant.

Secretary WEEKS. The lease is made in such form that the lessor agrees to maintain the plant in as good condition as it was received.

Mr. FIELDS. Will this cost of maintenance materially increase within a few years by reason of deterioration?

Secretary WEEKS. Undoubtedly there will be some expense every year in the maintenance of those plants.

Mr. FIELDS. I have heard it stated that the entire roof of the buildings, which is a very considerable item, would have to be replaced within 10 years.

Secretary WEEKS. I do not think that is so. There have been more foolish things said, pro and con, in reference to Muscle Shoals than in reference to any other matter I have ever investigated.

Mr. FIELDS. If my memory serves me correctly, I saw somewhere in House Document 167, that if this plant is maintained in a stand-by condition it will practically all have to be replaced in 20 years, because of deterioration and obsolescence.

Secretary WEEKS. I would not attempt to answer that question. I should refer that question to the Chief of Engineers.

Mr. FIELDS. Mr. Secretary, I would like to ask at this point whether Mr. Ford submitted this proposition upon his own volition or at the request of the War Department, that is, the original proposition?

Secretary WEEKS. This proposal evidently came in reply to a letter written by the Chief of Engineers to a great many companies asking if they were interested in taking up this proposition.

Mr. FIELDS. Will you put in the hearings at this point a copy of that letter?

Secretary WEEKS. Yes.

(The letter referred to is on page 99.)

Mr. FIELDS. Was this same letter sent to many individuals or firms throughout the country? I assume it was.

Secretary WEEKS. Yes.

Mr. FIELDS. Had you received other definite proposals to lease, or lease and purchase together this property, prior to the date you forwarded to Congress Mr. Ford's proposition?

Secretary WEEKS. Yes; I have had five different propositions at different times.

Mr. FIELDS. They were possibly not as favorable as Mr. Ford's, or they would have been sent along?

Secretary WEEKS. They were not as favorable up to the time Mr. Ford's offer was sent here. I have two on hand now, one of which I intend to send here so that the committee may have the information which it furnishes.

Mr. FIELDS. I notice this has been referred to before, Mr. Secretary, but I desire to turn to it in connection with a question that Mr. Wurzbach discussed in reference to paragraph 19 of the contract. If Mr. Ford immediately proceeds to install a plant, or organize a company there at an expense of some \$10,000,000, which it has been suggested it contemplated—

Secretary WEEKS (interposing). I do not know that Mr. Ford—that is, Mr. Ford in his discussions with me declined to guarantee to put in any amount of money, so that that statement ought to be modified to that extent.

Mr. FIELDS. In the event that should be done, it would, as far as the company itself is concerned, put a very strong guaranty behind this agreement with the Government, would it not?

Secretary WEEKS. The company may not have any responsibility at all.

Mr. FIELDS. As Mr. Wurzbach called attention to, Mr. Ford binds himself and his heirs and assigns, and for the present, or during his life, that would be a pretty strong guaranty behind any agreement that he makes with the Government, would it not?

Secretary WEEKS. It would be, except that you have got to proceed against them for damages, and to prove damages in a matter of that kind, would be very difficult.

Mr. FIELDS. Suppose, just by way of comparison, that after this contract is made, for some reason, the appropriating powers should delay or ultimately decide not to make an appropriation. What would his relief be?

Secretary WEEKS. This would be an agreement signed by somebody authorized by Congress, and I hope the time has not come when this Government is going to violate an agreement with a citizen.

Mr. FIELDS. I hope so, too; but sometimes appropriations have been materially delayed, and that thought came to my mind in passing.

Secretary WEEKS. It might be.

Mr. FIELDS. I notice on the same page, page 10, you recommend a 50-year lease instead of a 100-year lease. Is it not a fact, Mr. Secretary, that you find that all franchises that have been granted up to this time for smaller concerns are more than 50 years' duration?

Secretary WEEKS. I have not that information, but the policy of the Government now is for 50-year leases, and I think that is a long-enough duration.

Mr. FIELDS. As a business man would you not determine the proper length of a franchise, to some extent, by the magnitude of the proposition, as it would be harder to finance a larger proposition than a smaller one?

Secretary WEEKS. But we can not tell anything about what is going to happen in this country in a hundred years. Every conceivable change may develop in a very much shorter time than that, and I do not think it is prudent as a matter of public policy to enter into contracts that run for longer than 50 years.

Mr. FIELDS. I observe further that you recommend that this agreement should provide that he shall operate under the Federal water power act, or the Alabama public service act. Is it not a fact that as soon as he would begin operations in the State of Alabama, by reason of their public service statute there, he would automatically become subject to that statute?

Secretary WEEKS. That might be a controverted question. The Ford engineers thought that would be true. But if that is so, why not put it in the agreement?

Mr. FIELDS. At this point I desire to insert in the hearing the pertinent parts of the Alabama public service statute; that is, the parts relating to this matter.

The CHAIRMAN. We have put the statute in the record.

Mr. FIELDS. We have not put in the Alabama law. I ask to insert the pertinent parts of the Alabama statute, Mr. Chairman.

The CHAIRMAN. If there is no objection, that will be done.

(Sections of the Alabama public utility act, approved October 1, 1920, governing the operation of electric power companies in Alabama, are as follows:)

"Sec. 2. * * * *Utility*.—Unless otherwise specified, the term 'utility,' when used in this act, shall mean and include every person, not engaged solely in interstate business, that now or may hereafter own, operate, lease, or control (1) any plant, property, or facility for the transportation or conveyance of or for the public of passengers or property by street or interurban railway; (2) any plant, property, or facility for the generation, transmission, or distribution, sale, or furnishing to or for the public of electricity for light, heat, or power or other uses, including any conduits, ducts, or other devices, materials, apparatus, or property for containing, holding, or carrying conductors used or to be used for the transmission of electricity for light, heat, or power or other uses; (3) any plant, property, or facility for the manufacture, storage, distribution, sale, or furnishing to or for the public of natural or manufactured gas for light, heat, or power or other uses; (4) any plant, property, or facility for the supply, storage, distribution, or furnishing to or for the public of water for manufacturing, municipal, domestic, or other uses; (5) any plant, property, or facility for the production, transmission, conveyance, delivery, or furnishing to or for the public of steam for heat or power or other uses; (6) any public wharf, dock, or terminal; (7) any toll bridge, ferry, or road; (8) any boat line propelled by any power and not regulated by the laws of this State heretofore or hereafter enacted as a steamboat or steam packet line. Unless otherwise specified, the term 'utility' shall also mean and include two or more utilities rendering joint service.

"*Rate*.—Unless otherwise specified, the term 'rate,' when used in this act, shall mean and include, in plural number as well as in the singular, every individual or joint rate, classification, fare, toll, charge, or other compensation for service rendered, or to be rendered, by any utility, and every rule, regulation, practice, act, requirement, or privilege in any way relating to such rate, fare, toll, charge, or other compensation, and any schedule or tariff, or part of a schedule or tariff thereof.

"*Service regulation*.—Unless otherwise specified, the term 'service regulation' shall mean and include every rule, regulation, practice, act, or requirement in any way relating to the service or facilities of a utility including the voltage of electricity, the heat units, pressure and candlepower of gas, the purity and pressure of water, and, in general, the quality of any commodity, service, or product supplied.

"Sec. 14. *Valuation of the property of a utility by the commission*.—The commission may, upon its own motion, at any time, and upon reasonable notice to any utility, when the commission deems it necessary to ascertain the value of the property of such utility, proceed to investigate, ascertain, and report the value thereof, and shall make such investigation, ascertainment, and report upon the request and application of any utility. To enable the commission to make such investigation and report, if upon its own motion it is authorized to employ such experts and other assistants as it may deem necessary. If such investigation and report be made upon the application of a utility, the same shall be made and the experts and assistants employed by the commission for that purpose shall be employed at the expense of the utility making such application. The commission may appoint examiners who shall have the power to administer oaths, examine witnesses, and take testimony in connection with any such investigation.

"In arriving at a valuation of the property of any utility as provided in this section, the commission shall give due consideration to the history and development of the utility and its property, original cost, cost of reproduction as a going concern, and other elements of value recognized by the law of the land for rate-making purposes. For the purpose of making such investigation, the members of the commission and its duly authorized agents and employees shall at all reasonable times have free access to the property, accounts, records, and memoranda of the utility whose property and rights are being valued, and it shall be the duty of such utility to aid and cooperate with the commission and its duly authorized agents and employees to the fullest degree for the purpose of facilitating such investigation. Upon the completion of the valuation of any utility, as herein provided, the commission shall thereafter keep itself informed of all extensions and improvements or other changes in the condition and values of the property of such utility and shall ascertain the value thereof, and shall from time to time revise and correct its valuation to the extent that may be necessary by reason of such extensions and improvements or other changes in the physical condition and resulting value of such property; and to this end every utility shall make such report and furnish such information as the commission may require.

"Sec. 17. *Supervision and regulation of utilities*.—The commission shall have general and exclusive power and jurisdiction to regulate and supervise every utility in respect

to its rates and service regulations and in respect of its franchises, licenses, and contracts in so far as they affect its rates and service regulations, and in respect to its financing and securities in accordance with the provisions and subject to the reservations of this act, and to do all things necessary and convenient in the exercise of such power and jurisdiction. Nothing in this act contained, however, shall be deemed to confer upon the commission power and jurisdiction to regulate and supervise in respect of rates and service regulations any utility owned and operated by any municipal corporation in the State. From time to time the commission may make such recommendations to any municipal corporation which owns and operates a utility as from its experience in the administration of this act may seem to the commission necessary or advisable.

"Sec. 23. *Operation, rates, etc.*—Every utility shall maintain its plants, facilities, and equipment in good operating condition and shall set up and maintain proper reserves for renewals, replacements, and reasonable contingencies. Every utility shall render adequate service to the public and shall make such reasonable improvements, extensions, and enlargements of its plants, facilities, and equipment as may be necessary to meet the growth and demand of territory which it is under the duty to serve. The rates and charges for the services rendered and required shall be reasonable and just to both the utility and the public.

"Sec. 25. *Schedules and contracts to be filed.*—Every utility shall file with the commission within 60 days from the going into effect of this act schedules showing all rates and service regulations in force for any services performed by it within the State: copies of all contracts embodying rates or service regulations which have not been approved by the commission or which are not in general operation shall likewise be filed.

"Sec. 32. *Commission may make orders.*—Whenever, after investigation in accordance with the provisions of this act, the commission shall be of the opinion that any provision or requirement of this act, or any order of the commission is being, has been, or is about to be violated, or may make and enter of record an order in the premises, specifying the actual or proposed acts or omission to act which constitute such real or proposed violation and requiring that such violation be discontinued or rectified, or both, or that it be prevented. No order, however, shall be made by the commission affecting any rate or service except as otherwise specifically provided, unless or until a public hearing has been held in accordance with the provisions of this act.

"Sec. 33. *Unlawful rates.*—It shall be unlawful except as herein otherwise provided for any utility to charge, demand, collect, or receive a greater or less rate for any service performed by it within the State or for any service in connection therewith that is specified in such schedule of rates and service regulations as may at the time be in force, or to demand, collect, or receive any rate not specified in such schedule of rates and service regulation. The rates and service regulations specified in such schedules shall be the lawful rates and service regulations until the same are changed as provided in this act; nor shall any person, except as herein otherwise provided, receive or accept any service from a utility for a rate greater or less than that prescribed in such schedules.

"Sec. 35. *Standards of service.*—That commission may prescribe adequate standards of service rendered or to be rendered by any utility, and may prescribe regulations for the examination and testing of such service and for the measurement thereof."

Secretary WEEKS. I want to suggest, Mr. Chairman, that there will be very considerable difference of opinion about whether the Alabama Public Service Commission or the Federal Water Power Commission has jurisdiction over a matter of this kind in the Tennessee River.

The CHAIRMAN. It might be well for the purpose of this committee to have both the laws before the committee when we consider the matter.

Secretary WEEKS. Very well.

Mr. FIELDS. Mr. Secretary, I believe it was stated in your letter that the Air Nitrates Corporation claimed to have a contract with the Government for some of this property proposed to be purchased by Mr. Ford.

Secretary WEEKS. Yes, they had.

Mr. FIELDS. What is your opinion, if you care to state it, as to the attitude of this corporation toward the completion of Dam No. 2 or the operation of nitrate plant No. 2?

Secretary WEEKS. I do not know about that, but their attitude is that they expect to have this property offered to them at the price the Government is willing to sell it for to anyone else.

Mr. FIELDS. I desire to state at this point, Mr. Chairman, for the benefit of the officers who will appear later, that I shall ask for the correspondence with Mr. W. D. Duke, I think the president of the Air Nitrates Corporation, with regard to nitrate plant No. 2.

The CHAIRMAN. That is for the benefit of the Chief of Ordnance, the Chief of Engineers, and the Acting Judge Advocate General?

Mr. FIELDS. Yes.

The CHAIRMAN. I hope those officers will kindly take notice of your statement.

Mr. QUIN. Mr. Secretary, is there anything in the language of the proposition of Mr. Ford that would indicate that he would not pay for the cost of acquiring the land and the flowage rights?

Secretary WEEKS. He does not intend to; he states to me he does not intend to and would not agree to do it.

Mr. QUIN. He could not of his own accord acquire that property under condemnation proceedings; that would have to be done by the Federal Government.

Secretary WEEKS. Probably.

Mr. QUIN. Then, as a legal proposition, the only way to acquire that land and the flowage rights is by condemnation proceedings on the part of the Federal Government, provided the people who own them will not sell them.

Secretary WEEKS. I do not think the question is so much the matter of acquiring the property; it is the question of who is going to pay for it.

Mr. QUIN. You say that it will cost at least a million and a half dollars?

Secretary WEEKS. That is what Mr. Ford's engineers believe it might be. The Government engineers say about \$2,000,000.

Mr. QUIN. When was the contract or lease made with the Alabama Power Co.?

Secretary WEEKS. On plant No. 2?

Mr. QUIN. Yes.

Secretary WEEKS. That was made last November.

Mr. QUIN. 1921?

Secretary WEEKS. Yes.

Mr. QUIN. For a five-year period?

Secretary WEEKS. For one year.

Mr. QUIN. Mr. Ford did agree to bind himself and his heirs and assigns to carry out this contract in the proposal which he submitted, did he not?

Secretary WEEKS. You can read the language; as far as his statement is concerned, he does.

Mr. QUIN. You spoke of a guaranty, and some gentleman asked you some question about the type of guaranty. What have you to say about that?

Secretary WEEKS. If he were to organize a company with a capital of between ten and fifteen million dollars, I think that might be considered one type of guaranty. But I have not any assurance that there is going to be any money behind the capital stock of this company which he is going to organize. Another form of guaranty would be a bond to carry this out. As this proposition now reads you have got to proceed against Mr. Ford or his estate for damages, in case they do not carry out the agreement.

Mr. QUIN. Would not the Government be bound to proceed in the same manner against any guarantor in the form of an indemnity company, or corporation you speak of?

Secretary WEEKS. You do not have to proceed in the courts against an indemnity company. They pay the indemnity.

Mr. QUIN. They do not just shell out the money. Do you not have to show liability?

Secretary WEEKS. Oh, yes.

Mr. QUIN. I beg to differ with you about these bonding companies. I have had some litigation with them and you have to sue them like you do anybody else.

Secretary WEEKS. That has not been my experience.

Mr. QUIN. Mr. Secretary, in the hearings of 1920 it was stated before this committee that the War Department had on hand 300,000 tons of nitrate. I do not know what it cost, but it is worth \$40 a ton to-day, you state?

Secretary WEEKS. About that.

Mr. QUIN. In case that plant at Muscle Shoals were thoroughly equipped for operation, the War Department's representative stated before this committee that they could sell that nitrate.

Secretary WEEKS. We have sold 80,000 tons of it.

Mr. QUIN. With this plant turned over to Mr. Ford, could you sell 150,000 tons of the remainder? You would be safe in doing that, would you not?

Secretary WEEKS. The Chief of Ordnance tells me he thinks it would be safe to reduce the stocks to about 150,000 tons, which would be about 60,000 tons more that could be sold.

Mr. QUIN. You could sell 130,000 tons, approximately, altogether.

Secretary WEEKS. Yes, but only some 60,000 tons additional.

Mr. QUIN. That much money could be put on this dam to finish it, could it not, without any other draft on the Treasury?

Secretary WEEKS. Of course, if that money were obtained from any source and were appropriated by Congress, it could be used to build the dam.

Mr. QUIN. In the time mentioned by Mr. Ford, 100 years, he proposes to give that back to the Government; the Government does not give him any title to it, and he is giving it back to the Government at the expiration of that time, is he not?

Secretary WEEKS. The Government gets all the dams back.

Mr. QUIN. Does not the Government get back that land which he is paying \$5,000,000 for?

Secretary WEEKS. No.

Mr. QUIN. What is that considered to be, a straight-out sale?

Secretary WEEKS. That is a straight-out sale.

Mr. QUIN. The dams themselves go back to the Government, with the preferred right in Ford or his company to make a new contract with the Government at the expiration of the lease?

Secretary WEEKS. Yes; the dams and the power plants.

Mr. QUIN. Mr. Secretary, what is the real objection to the lease being for 100 years?

Secretary WEEKS. I do not think it is good public policy in this developing period that we are going through to have a lease made for as long a period as 100 years.

Mr. QUIN. Granting all that to be true, this is an immense proposition in financing a plant, and it will take many millions of dollars.

Secretary WEEKS. The Government is furnishing that.

Mr. QUIN. That is true to the extent of building the dams, but in the operation of them the Government will not furnish that. What assurance will Mr. Ford have that he could finance them for so short a period as 50 years?

Secretary WEEKS. Simply drawing his check on the bank would finance him. He has got more cash in the bank than he will ever put into this enterprise.

Mr. QUIN. There is no doubt about Mr. Ford having financial backing to operate the plant successfully?

Secretary WEEKS. Undoubtedly.

Mr. QUIN. It is your idea that the lease ought to be made for 50 years, the Government to get a better proposal at the end of the 50 years?

Secretary WEEKS. Possibly so; yes.

Mr. QUIN. If this man, or the Ford Corporation, developed the fertilizer business there and the current business to carry such an enterprise across 600 or 700 miles, do you not think it would be reasonable to give him a lease for 100 years, if he could do that?

Secretary WEEKS. I do not think so.

Mr. QUIN. In view of the probability of the Government making a better contract at the end of 50 years, you think it is better to lose that now?

Secretary WEEKS. I am not in favor of the Government making any lease for 100 years?

Mr. QUIN. No kind of a lease?

Secretary WEEKS. No kind of a lease. However, I think I ought to add that I do not think that is vital to this offer.

Mr. QUIN. That is, the term of years?

Secretary WEEKS. No. I would not think it was vital at all.

Mr. QUIN. I believe Mr. Ford considers that a vital question.

Secretary WEEKS. I do not know why he should. The amortization of the indebtedness would be reduced from 100 to 50 years; the plant would not be paid for at the end of 50 years, but the Government would have its investment there and it would not make any difference to Mr. Ford.

Mr. QUIN. It would be paid for entirely at the end of 50 years, provided the Government got 4 per cent, and it costs \$40,000,000 or \$50,000,000 to build it?

Secretary WEEKS. It would take 97 years to accumulate the fund to retire \$40,000,000 at 4 per cent.

Mr. QUIN. The loss you have on that plant now in actual deterioration amounts to more than the cost to the Government of maintaining it, annually?

Secretary WEEKS. On No. 2?

Mr. QUIN. Taken as a whole.

Secretary WEEKS. We do not know what the deterioration amounts to.

Mr. QUIN. The Government is put to a fixed cost in guarding it and looking after it.

Secretary WEEKS. Not while it is under lease.

Mr. QUIN. You have no expense at all during that time?

Secretary WEEKS. There is a lot of property around there. There is the property at the nitrate plant No. 1, which the Government had to look after, but the lessee takes care of the power plant while it is under lease.

Mr. QUIN. What I would like would be to have you give the difference between what the Government has to pay out every year and what it receives from these leases you mention. I would like to have that statement in the record.

Secretary WEEKS. As to the matter of dollars and cents, the Government is getting more out of those leases than it is spending there now.

Mr. QUIN. Of course, the normal deterioration is a big element in figuring the amount invested.

Secretary WEEKS. That is considerable, but we do not have to take that into consideration at the Warrior plant, because that is to be returned in as good condition as it was, and at power plant No. 2 the condition is the same. That is the only outside property we have to look after.

Mr. QUIN. The territory adjacent has phosphorus rock in it, has it not?

Secretary WEEKS. I have been told that there is some of that in Tennessee.

Mr. QUIN. About how many miles above this dam is phosphorus rock?

Secretary WEEKS. About 100 miles.

Mr. QUIN. If the river was navigable the phosphorus rock could be floated down in barges from the phosphorus beds to the plant at Muscle Shoals?

Secretary WEEKS. This is near the town or city of Columbia, which is on the Duck River, not far from Nashville, I think, and not on the Tennessee River at all, so the Tennessee River navigation would not apply to that.

Mr. QUIN. It would have to come in on other streams, if they could take it down on barges?

Secretary WEEKS. Yes.

Mr. QUIN. Mr. Secretary, I suppose that the contract which the Government has with these people who own the patents for the fixation of nitrogen is such that it could be transferred to Mr. Ford by the Government, or to his company?

Secretary WEEKS. I think there is a question about that, and I would like to have you ask that question of the Acting Judge Advocate General. I am not a lawyer, and I do not want to get into a legal discussion.

Mr. QUIN. I simply wanted to know whether the Government could carry out its contract with Mr. Ford, in case his offer is accepted.

Secretary WEEKS. Col. Hull can answer that question.

Mr. FISHER. Mr. Secretary, have we before us now all of the propositions you have for the purchase or transfer of Muscle Shoals that you have thought worthy of consideration?

Secretary WEEKS. I have another I am going to send to you in three or four days which I think the committee ought to have.

Mr. FISHER. May I ask how many propositions have been presented to the Secretary of War?

Secretary WEEKS. Five in all.

Mr. FISHER. Would it be possible for the committee to have the advantage of having a copy of each one of those five propositions in the hearing?

Secretary WEEKS. Two of them have been withdrawn, so I do not think they are of any moment.

Mr. FISHER. That would leave three still pending.

Secretary WEEKS. Yes; Mr. Ford's and two others.

Mr. FISHER. Would you be kind enough to let the committee have copies of those before it, and put them in the record?

Secretary WEEKS. Yes. (These offers appear hereafter.)

Mr. FISHER. I notice on page 10 of your letter to the Speaker of the House you say, "If Mr. Ford's proposal be accepted by Congress, I suggest that there should be certain modifications made to safeguard the Government's interests. As heretofore stated, there should be some assurance that the contracts made by his proposed company will be carried out." I will ask you whether or not, in the negotiations that have been had between Mr. Ford and the War Department since last July, such suggestions in reference to the proposed assurance have been made by the War Department to Mr. Ford or his representatives?

Secretary WEEKS. Frequently to him or to his representatives.

Mr. FISHER. They were not included in the last draft presented by Mr. Ford?

Secretary WEEKS. Mr. Ford declines to guarantee anything whatever, but he put in paragraph 19, which you are familiar with.

Mr. FISHER. In the other propositions that have been presented are there any more assurances than in the Ford proposition?

Secretary WEEKS. They are in very different form.

Mr. FISHER. They are different propositions altogether?

Secretary WEEKS. Yes.

Mr. FISHER. I would like to know whether or not the War Department has to-day a plant for nitrate preparedness which is comparable to the provisions of section 16 of

the Ford offer, which provides for the turning over upon five days' notice in time of war of the entire facilities of nitrate plant No. 2, with the personnel, and the keeping up for 100 years of an adequate and efficient laboratory for the use of our Army officers?

Secretary WEEKS. No.

Mr. FISHER. In the estimate that has been made by the War Department as to the salvage value, shown on page 22, the salvage value of No. 2 is shown to be a little over \$7,000,000. I would like to know whether or not the offer of Mr. Ford, if accepted, tendering to the Government at all times a magnificently equipped nitrate-producing plant, would be worth more than \$7,000,000, the tender running for 100 years, or tendering it to the Government in the event of war.

Secretary WEEKS. That is of material value, of course.

Mr. FISHER. I would like to ask you whether or not it is not an asset for national preparedness such as we had never hoped for before.

Secretary WEEKS. I do not want to admit that.

Mr. FISHER. That we had planned for even with the money that would be appropriated by Congress.

Secretary WEEKS. I believe that in 20 years there will be a large number of plants in the United States producing nitrates; that it is going to be a very common process.

Mr. FISHER. But the proposal as offered in paragraph 16 is a magnificent one as it stands to-day, with the present financial condition of our Government?

Secretary WEEKS. I do not know that I would agree with your adjective, but with your sentiment I do agree.

Mr. FISHER. I would like to know whether or not the War Department has any plan for the utilization of these plants so that chemicals could be manufactured or produced to be used in the making of cheap fertilizers. Has the War Department now a plan for the utilization of the Muscle Shoals plant for the production of chemicals which could be used in the manufacture of cheap fertilizers?

Secretary WEEKS. I think you had better ask Gen. Williams that question.

Mr. FISHER. I would like to ask you this question: In the event the Ford offer is not accepted, is it the attitude of the War Department now that a recommendation will be made to Congress to complete the Wilson Dam?

Secretary WEEKS. I would make that recommendation.

Mr. FISHER. Would that recommendation carry with it anything further than the production of power?

Secretary WEEKS. No.

Mr. FISHER. So, as far as the outlook for the production of chemicals for the manufacture of cheaper fertilizer is concerned, no plan has been made for that?

Secretary WEEKS. I ought to modify that answer, that unless we could use, by lease or otherwise, the plant we have there for that purpose. Of course, the Government will retain that plant for its own requirements. At present at least the Government will do that, and it will make use of its property wherever it may be without affecting its ultimate use for governmental purposes.

Mr. FISHER. The present plan would be to retain it in a stand-by condition?

Secretary WEEKS. Yes.

Mr. FISHER. Is the condition of a plant like nitrate plant No. 2 as favorable as it would be if it were maintained under section 16 of Mr. Ford's offer? Is a plant in stand-by condition as effective or efficient as one operated with personnel, as described in section 16?

Secretary WEEKS. I would not undertake to say that we could get enough for it to entirely provide for the maintenance of the plant. In some years we might and in some years we might not. I do not know.

Mr. FISHER. I judge from your answers that the War Department is working on a proposal for the utilization of No. 2 other than in a stand-by condition.

Secretary WEEKS. Perhaps there is nothing definite because it is a matter which has been before the department for six months. If this is accepted, there is no reason why the War Department should work on other plans.

Mr. FISHER. Something has been said relative to an option which has been retained by two companies which had had contracts with the Government. Do you consider that there is any moral obligation to defer everything because of that option, which has been declared illegal?

Secretary WEEKS. Undoubtedly a Government board gave the option and it is charged in the legal opinion that that board had no right to do it. I leave it to you to make up your own mind what the Government ought to do under those circumstances.

Mr. FISHER. Did the Government draft the agreement, or did these two corporations draft the agreement, that was finally entered into?

Secretary WEEKS. I do not know about that.

Mr. WRIGHT. Mr. Secretary, there is no dam No. 1?

Secretary WEEKS. There is no dam No. 1 in this proposition. That is a navigation project.

Mr. WRIGHT. It is very small dam, is it not, that is contemplated, about 6 feet high?

Secretary WEEKS. I do not know the exact height, but it is a small dam and, compared with the total expenditures, it is not of great importance in regard to cost.

Mr. WRIGHT. A good deal has been said of the salvage value, and it has been estimated from \$8,000,000 to \$16,000,000. That would include the salvage of nitrate plant No. 2?

Secretary WEEKS. Yes.

Mr. WRIGHT. That is one project the department does not feel it should let go?

Secretary WEEKS. No; we would not do that under present conditions.

Mr. WRIGHT. It should be maintained and retained?

Secretary WEEKS. Under present conditions.

Mr. WRIGHT. I believe you said this morning that Dam No. 3 would not be necessary except for the fertilizer proposition.

Secretary WEEKS. Except for Mr. Ford's requirements.

Mr. WRIGHT. It would be a fertilizer proposition and also a navigation proposition?

Secretary WEEKS. I do not mean to answer that in the affirmative, because presumably Mr. Ford is going to use a large quantity of his power for some other purpose than manufacturing fertilizer. Whether he is going to construct some manufacturing enterprises there or sell the power, I do not know; I am not in his confidence on that.

Mr. WRIGHT. From the present outlook it would seem that the fertilizer proposition would make necessary the construction of Dam No. 3.

Secretary WEEKS. I do not believe that is necessarily so. Dam No. 2 would furnish all the power that would be used for the manufacture of fertilizer.

Mr. WRIGHT. Of course this whole project is primarily essentially one for the War Department for the purpose of producing explosives? That is the primary essential object?

Secretary WEEKS. That was the original purpose.

Mr. WRIGHT. Of course it is still the purpose of the War Department, if it is to be retained, that it should be retained for that purpose.

Secretary WEEKS. Yes, it will be retained at present; as I have stated, or did state before, I believe within a limited number of years there will be a great amount of fixation of nitrogen so that the question of the Government's maintaining a plant for that purpose may not be necessary.

Mr. WRIGHT. The fertilizer proposition is simply incidental and secondary, and always was, I presume.

Secretary WEEKS. The fertilizer proposition is apparently new.

Mr. WRIGHT. It is incidental to the real, primary object of the plant?

Secretary WEEKS. Yes.

Mr. WRIGHT. Of course, the object at first was to make explosives in war time and a sufficient quantity in peace time, and incidentally to use the power there for such manufacture of fertilizer as could be done?

Secretary WEEKS. That is the pending proposition.

Mr. WRIGHT. That was always the thought, was it not?

Secretary WEEKS. I do not know that it was; I am comparatively new in this matter. Just how far back the fertilizer part of it goes, I do not know.

Mr. WRIGHT. It was put in the law which authorized the construction.

Secretary WEEKS. Quite likely.

Mr. WRIGHT. You have made a very careful study of this Ford offer.

Secretary WEEKS. I have spent some time on it.

Mr. WRIGHT. For the benefit of the committee, would you mind giving us the advantage of some of the thoughts you have bestowed on it by telling us your estimate of the advantages which would accrue to the Government if the Ford offer is accepted, and then tell us of the disadvantages?

Secretary WEEKS. I tried to do that in the comments which I made to Congress.

Mr. WRIGHT. I suppose we have read that several times, but it is so much different from reading it to hear it spoken.

Secretary WEEKS. I do not know that I want to materially change that.

Mr. WRIGHT. I think, if you will permit me, you made a very elaborate and succinct report on that whole proposition. The first advantage would be that this plant would be maintained in an up-to-date condition so that explosives can be manufactured at any time the Government might require?

Secretary WEEKS. Yes.

Mr. WRIGHT. That is the big thing.

Secretary WEEKS. From the Government standpoint

Mr. WRIGHT. Then incidentally it might develop a great quantity of cheap fertilizer could be produced there.

Secretary WEEKS. There is the sticking point. If anybody could convince me to a certainty that there could be a large amount of fertilizer produced I should feel much more enthusiastic about Mr. Ford's offer than I do now. But I have not sufficient evidence that that can be done, and, incidentally, I do not believe Mr. Ford, or his engineers, know whether it can be done.

Mr. WRIGHT. You regard that as in the experimental stage?

Secretary WEEKS. I do; in fact Mr. Ford put it into his offer that he would experiment on the manufacture of fertilizer.

Mr. WRIGHT. Perhaps subparagraph A of paragraph was inserted with that very idea in mind. It says:

"To determine by research whether by means of the electric furnace method and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grade and at lower prices than fertilizer using farmers have in the past been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries."

Secretary WEEKS. Mr. Ford undoubtedly believes there are going to be great developments along those lines, and undoubtedly he took Mr. Edison down there to get his judgment on that subject. Just how valuable the judgment of either of them is I would not undertake to say, but it would be a very bold man who would be willing to say there was not going to be any development in chemistry along those lines, and Mr. Ford may work out something of great benefit.

Mr. WRIGHT. That is why I have called attention to subparagraph A. He obligates himself to make those experiments.

Secretary WEEKS. Yes; but the very fact that he calls them experiments would indicate that he is not certain about it.

Mr. WRIGHT. Do you happen to know what Mr. Edison's views are on that matter?

Secretary WEEKS. I have never talked to him about it. I know what his views are about paying for the property.

Mr. WRIGHT. Does he think it is worth anything?

Secretary WEEKS. I refer to the manner of paying for it.

Mr. WRIGHT. Mr. Miller propounded quite a number of questions about this matter, and the trend of his questions would indicate perhaps it would be a good idea to donate the property to Mr. Ford.

Mr. MILLER. I made no suggestion of that character.

Secretary WEEKS. I think Mr. Miller meant that the Government was not going to get very much out of the \$5,000,000 Mr. Ford was going to pay.

Mr. WRIGHT. \$5,000,000 sounds very small in comparison with the many billions of dollars the Government has spent; but is not this like the Government money spent on other war projects? It is a question of whether having passed over the wheel it is not already lost.

Secretary WEEKS. Most of this was lost.

Mr. WRIGHT. You are striving to get the most out of it for the Government and utilize it in the best way for the Government and the people?

Secretary WEEKS. Yes.

Mr. WRIGHT. And incidentally there might grow out of the Ford offer quite a development in four or five States around there?

Secretary WEEKS. That is possible; I have had that in mind.

Mr. WRIGHT. Do you share in common with some of us the thought that whatever Henry Ford touches is like magic, and it is a go from the very start?

Secretary WEEKS. I do not know of any of Mr. Ford's activities that have been magical except his car.

Mr. WRIGHT. I believe he took over a railroad and is now operating that railroad so profitably that he wants to reduce the rates and the Interstate Commerce Commission will not let him do it.

Secretary WEEKS. I have not analyzed the figures.

Mr. WRIGHT. In addition, Mr. Secretary, the question of navigation of the Tennessee River would be very material, would it not?

Secretary WEEKS. You want my absolute opinion on that?

Mr. WRIGHT. Yes.

Secretary WEEKS. I would not advise the development of the Tennessee River at Muscle Shoals for navigation purposes; that is, I would not appropriate the money this year.

Mr. WRIGHT. I speak of this as an incident that would grow out of the development.

Secretary WEEKS. If it were not for the building of the dam development for navigation this perhaps would cost much more.

Mr. WRIGHT. Following the construction of the dams will come navigation on the river.

Secretary WEEKS. With the probability that at some time the river will be improved for navigation at this locality it is necessary to put the locks in at the time the dams are constructed, so I am entirely in favor of doing that.

Mr. WRIGHT. It is simply independent of the project?

Mr. STOLL. Referring again to the guarantees, the Government has made some leases to private concerns of certain water powers, has it not?

Secretary WEEKS. All I know about that is this: I am chairman of the Federal Water Power Commission now, and the Water Power Commission is acting under the provisions of the water power act, and those leases and permits are limited to 50 years.

Mr. STOLL. Are there any guarantees there by the lessees to the Government?

Secretary WEEKS. They furnish their own money.

Mr. STOLL. But they take over Government property.

Secretary WEEKS. They are granted a permit on a navigable stream to build a dam, for example, and they build the dam with their own money. The Government has nothing to do with financing those propositions and the permit only continues for 50 years.

Mr. STOLL. In regard to the 50-year period, if the Ford offer should prove satisfactory in every respect except the 50-year period, do you think that is sufficiently wrong in principle to warrant the discrediting of the Ford offer?

Secretary WEEKS. If it was satisfactory in all respects, so far as Congress is concerned, I should say not.

Mr. STOLL. You mean that the 50-year period would not be considered, but that you would let it go at 100 years?

Secretary WEEKS. I would consider it to be my duty.

Mr. STOLL. You do not think it would warrant rejecting the offer if it is satisfactory in other respects?

Secretary WEEKS. I do not think so.

Mr. STOLL. From the standpoint of the Government, which is better, the Ford offer or the salvaging of Muscle Shoals?

Secretary WEEKS. I wish I could answer that question with great frankness and certainty. But I can not with certainty. I believe that a sale of the Warrior plant and the properties in that neighborhood can be made for more than the Ford offer is paying for all that property. I believe that can be done. I believe that the Wilson Dam can be completed without taking a dollar out of the Treasury of the United States.

Mr. STOLL. I do not mean that. The Ford offer contains certain specific things, including the maintaining of the plant for the benefit of the Government and the manufacture of fertilizer for the benefit of the farmers. I am taking the Ford offer as it stands. Which is better from the standpoint of the Government, to accept that offer or to salvage Muscle Shoals?

Secretary WEEKS. The Government is not going to salvage plant No. 2, and the whole essence of Mr. Ford's offer is, in my judgment, whether people are going to get fertilizer at lower cost than heretofore. If that phase of the offer were eliminated, I think quite as advantageous disposition could be made of this property as Mr. Ford's offer.

Mr. STOLL. Are you familiar with the fertilizer proposition? There was about 7,000,000 tons used in the United States in 1920, I think. What per cent of nitrate is in that fertilizer—about 3 per cent, is there not?

Secretary WEEKS. There are all kinds of fertilizer.

Mr. STOLL. I know; but the usual fertilizer is 3 per cent nitrate, is it not?

Secretary WEEKS. I am a farmer, and when I want to buy fertilizer, I send soil to a chemist for an analysis and I buy fertilizer that fits the soil.

Mr. STOLL. Is it not a fact that the average fertilizer which a farmer uses has about 3 per cent of nitrate in it?

Secretary WEEKS. I do not know that.

Mr. STOLL. That is my information.

Mr. GARRETT. Mr. Secretary, Mr. Stoll and other members of the committee have covered very well practically all the questions I wanted to ask you. If I understood your answer to a question by Mr. Crago it was that while you had certain objections to this lease you had pointed out in your communication to the Speaker of the House, you were willing to say that if you were convinced in your own mind, as a matter of fact, Mr. Ford could manufacture, or would manufacture, fertilizer at this location in such proportion that it would materially reduce the price of fertilizer to the consuming public you would then favor this proposition?

Secretary WEEKS. That is in substance what I said. However, that is a pretty important question, and I want to have the privilege of revising that answer, putting it in just the form I would like to have it. I do not want to have somebody else put phraseology in my mouth.

Mr. GARRETT. I am not attempting to do that.

Secretary WEEKS. I know you are not.

Mr. GARRETT. I understood you to say that in your opinion, from the facts, the matter would have to appeal to each Member of Congress when the whole record was presented as to whether Mr. Ford could materially reduce the price of fertilizer to the consuming public by taking over this plant under certain terms and conditions as shown in the evidence before the committee.

Secretary WEEKS. Getting a lease for 100 years?

Mr. GARRETT. Yes. Do you consider his contract is so hedged about with provisions that he would be required to produce fertilizer to the capacity mentioned in his contract for the period of the time mentioned?

Secretary WEEKS. I do not think so.

Mr. GARRETT. Then you want that part of it strengthened?

Secretary WEEKS. I do; and lest I may be accused of not giving Mr. Ford the intention of good purposes in carrying out his proposition, I want to say, if Mr. Ford said he would see that it was done, as long as he lived it would be done.

Mr. GARRETT. In a proposition of this kind we have to have it so framed and drawn that it will be done after the man who made it is dead and gone?

Secretary WEEKS. Yes; we are here providing something for our great-grandchildren.

Mr. GARRETT. I think we should hedge it about with every precaution and restriction to bring the desired results to future generations. But these 110,000 tons of nitrate of ammonia that his contract calls for would be a component part of about 3,000,000 tons if made up into fertilizer, as commonly used by the farmer, would it not?

Secretary WEEKS. I can not answer that question.

The CHAIRMAN. This Muscle Shoals plant originated under a provision of the national defense act, passed in 1916, I think on June 3, 1916, was it not? That was provided for in section 124 of that act, was it not?

Secretary WEEKS. The correct answer to that question applies to No. 1 plant, not to No. 2.

The CHAIRMAN. Were not all the plants started as a result of that legislation, covering the development of the Muscle Shoals plant, as provided in section 124?

Secretary WEEKS. I think not. I have a copy of a letter from President Wilson to the Secretary of War, dated February 23, 1918, which refers to his wishes regarding the setting aside of money to construct plant No. 2.

The CHAIRMAN. I think we appropriated in that act \$20,000,000.

Secretary WEEKS. I will read this letter:

THE WHITE HOUSE,
Washington, February 23, 1918.

MY DEAR MR. SECRETARY: I refer to section 124 of the national defense act of June 3, 1916, authorizing the President to determine the best means and adopt the most advantageous projects for the production of nitrates, and appropriating the sum of \$20,000,000 for that purpose. Of this appropriation, I am advised that there is an available unallotted balance of \$13,785,000.

The completion of Dam and Power House No. 2, at the Muscle Shoals on the Tennessee River, as designed and projected by your department, is, in my judgment, of vital importance in accomplishing the purpose of the law. I should be pleased, therefore, to have you allot to that work all of the aforesaid balance, after deducting the sum of \$400,000, which I understand will be required for the purchase of land required in connection with another project.

Cordially and faithfully, yours,

WOODROW WILSON.

HON. NEWTON D. BAKER,
Secretary of War.

The CHAIRMAN. That shows that Muscle Shoals was originally provided for under that section of the national defense act.

Secretary WEEKS. I am informed, Mr. Chairman, that this money applies to dam No. 2, and not the nitrate plant.

The CHAIRMAN. What money went into the nitrate plant? Or, if I may broaden the question somewhat, what funds were called upon to complete, so far as they have been completed, these various projects?

Secretary WEEKS. The money to construct the nitrate plants was provided in the fortifications act.

The CHAIRMAN. A military proposition?

Secretary WEEKS. Yes.

The CHAIRMAN. This whole proposition was a military proposition?

Secretary WEEKS. Fundamentally, undoubtedly.

The CHAIRMAN. And the purpose is primarily to furnish explosives for the Government?

Secretary WEEKS. I think probably that is a correct statement of the primary purpose.

The CHAIRMAN. And Mr. Ford promises that he will keep alive permanently and improve, if necessary, nitrate plant No. 2 and turn it over to the Government for the making of explosives any time the Government wants it?

Secretary WEEKS. I think this will be a correct answer to your original inquiry that the nitrate money was spent to purchase the land at No. 1 plant, but the money to construct both No. 1 and No. 2 came from the fortifications act. If that is not correct I will have further investigations made, and I will have the correct answer put in the record.

The CHAIRMAN. At any rate, that money was taken from a military source; that is the fact, is it not?

Secretary WEEKS. Undoubtedly, if it came from the fortifications act it was appropriated for a military purpose.

The CHAIRMAN. I want to say frankly to you that there is some question of the jurisdiction of this committee being raised, and I am asking these questions to show that it was a military proposition right from the beginning. Mr. Ford's offer sets out very clearly that he is willing to do with nitrate plant No. 2 for the purpose of making explosives during the term of the lease, does it not?

Secretary WEEKS. Yes.

The CHAIRMAN. So in your opinion the desire to keep up the maintenance of a factory that will produce explosives for the Army in this country is one of the primary objects of this proposition?

Secretary WEEKS. It was a primary object, and is of importance now; but I think will lessen in importance as the years go by.

The CHAIRMAN. Of course, the fewer wars we have the less important the use of powder will become; but at this time in the history of the country would you advise that we quit manufacturing explosives and just drift along as we have always done in our history?

Secretary WEEKS. We are not disturbed about the manufacture of explosives at this time, with the amount we have on hand.

The CHAIRMAN. I understand that situation, and that is a very important proposition in your mind at present?

Secretary WEEKS. The maintenance of this plant should be continued for Government purposes.

Mr. PARKER. Mr. Secretary, I omitted to ask you one question. Do you estimate on spending \$22,000,000 in building Dam No. 2 if we do not accept the Ford offer?

Secretary WEEKS. I would do it.

Mr. PARKER. Did I understand you to say you do not think that money would have to be spent from the Treasury. Why do you say that?

Secretary WEEKS. I think arrangements can be made to produce that money through an issue of bonds.

Mr. PARKER. You would have to borrow the money from the Government?

Secretary WEEKS. Not from the Government either.

Mr. PARKER. Other people would produce it?

Secretary WEEKS. Other people would produce the money, in my opinion. Of course, Mr. Parker, you understand I have not any definite proposition that will sustain that opinion of mine.

Mr. PARKER. I did not mean to ask for one, but I wanted to ask you this question: As you can run the nitrate plant by steam, and do now, what object would you have in completing Dam No. 2?

Secretary WEEKS. You mean from the Government standpoint?

Mr. PARKER. From any standpoint.

Secretary WEEKS. I would complete Dam No. 2, because you have a foundation there, a splendid piece of work, and you can, in my opinion, develop power enough there to sell power.

Mr. PARKER. You would spend, you say, \$22,000,000?

Secretary WEEKS. Twenty-two million dollars and probably more.

Mr. PARKER. It is then a commercial proposition to complete it for the sake of the power you can develop?

Secretary WEEKS. That is my judgment.

Mr. PARKER. With reference to the manufacture of these nitrates by the cyanamide process can not that be done wherever there are coke ovens, coal, and limestone?

Secretary WEEKS. It could be done.

Mr. PARKER. Is it not better to have it done where there are coal mines and coke ovens?

Secretary WEEKS. I think there is a large surplus of that material at this time.

Mr. PARKER. It is not made there, is it?

Secretary WEEKS. No.

Mr. PARKER. So that the manufacture is usually carried on where there are coke ovens, or where they have limestone in the neighborhood.

Secretary WEEKS. You must necessarily have power for the cyanamide process.

Mr. PARKER. Is there much power needed in that process?

Secretary WEEKS. A good deal of power. I understand.

Mr. PARKER. But if you are near a coal mine, the smallest coal is sometimes used

Secretary WEEKS. It can be.

Mr. PARKER. There is therefore no particular necessity for having this particular place for manufacturing large quantities of nitrate by the cyanamide process?

Secretary WEEKS. To manufacture successfully you need very cheap power. Of course, in time of war we would not pay much attention to the cost of power, but if that were to be used in time of peace it would be very desirable for the Government to have cheap power for the purpose.

Mr. PARKER. Do you know whether water power, on the whole, is cheaper than the power that can be gotten from coal, if you are close to coal mines?

Secretary WEEKS. It makes a vital difference where it is. There are cases where power can be developed from coal cheaper than almost any water power, and water powers are not the gold mines that many people imagine.

Mr. PARKER. And if they are at the coal mine where they can get coal cheaper, they can develop cheaper power than by water power.

Secretary WEEKS. I am told so.

Mr. HULL. My mind is not clear, Mr. Secretary, in regard to your idea as to completing this proposition. Just how is that to be done? If you issue bonds on it, it would require legislation, would it not?

Secretary WEEKS. If I had a definite proposition which I could put before the committee, I would do so, but I have not. The discussions I have had with various people lead me to the conclusion that water power can be developed at Dam No. 2, which will carry an issue of probably \$25,000,000 bonds; that is to say, if the Government would give you that foundation and you could sell the power developed by that dam at what are normal prices in that vicinity you could probably float an issue of \$20,000,000 or \$25,000,000 in bonds to complete the dam.

Mr. HULL. I quite agree with you on that. Would it be possible to do the same thing with the Ford proposition?

Secretary WEEKS. You have it complicated with Dam No. 3, which is quite a different matter.

Mr. HULL. I just wanted your opinion of it.

Secretary WEEKS. It depends on what Mr. Ford is going to do with his power. If he were to manufacture aluminum and use the entire power for that purpose and he would allow a sufficient rate for the power you might do it. But I do not know what he is going to do with it.

Mr. HULL. If you decide to complete the proposition outside of the Ford matter, there would be practically no difference in the time of the completion of the dam, would there?

Secretary WEEKS. I think the dam can be completed under contract in 30 months.

Mr. HULL. In either case it would not make much difference whether it was for Ford or for the Government itself?

Secretary WEEKS. Except in the Ford proposition you will lose the interest on the cost of the completion of the dam for a considerable period.

Mr. HULL. In your opinion there would not be much difference in the cost, whether it was for Ford or for somebody else?

Secretary WEEKS. I do not think so.

Mr. HULL. You would be able to salvage it better as a completed project than you are at the present time?

Secretary WEEKS. I think so.

(Thereupon, at 4.50 o'clock p. m., the committee adjourned to meet to-morrow, Thursday, February 9, 1922, at 10.30 a. m.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Thursday, February 9, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. Gentlemen, I have received a telegram from Mr. Liebold in response to the telegram that I sent him and which was read at the hearing yesterday. It is as follows:

DETROIT, MICH., January 8, 1922.

MR. JULIUS KAHN,
*Chairman Committee on Military Affairs,
Washington, D. C.*

Your telegram received. In view of the fact that Mr. Ford finds it impossible to come to Washington, we are asking Mr. J. W. Worthington to call on you and to be of such service as is possible.

E. G. LIEBOLD,
General Secretary to Henry Ford.

I want to say that this morning Mr. Worthington did call on me and said that Mr. Ford's representatives will be glad to answer any questions, but they are all very busy and will not be able to appear before the committee until next Monday. He has stated that Mr. Mayo, whose name appears in connection with the offer of Mr. Ford, I think as a witness—

MR. FIELDS. May I state in that connection, Mr. Chairman, that I read in this morning's paper a statement given to the Associated Press in Detroit by Mr. Ford to the effect that while he is very busy, he would come in person if the committee thought it necessary to do so.

The CHAIRMAN. Mr. Worthington stated that they would be here at 10.30 o'clock Monday morning to answer any questions that the committee might desire to ask.

STATEMENT OF MAJ. GEN. C. C. WILLIAMS, CHIEF OF ORDNANCE, ACCOMPANIED BY MAJ. JAMES H. BURNS, ORDNANCE DEPARTMENT.

The CHAIRMAN. General, we are considering the offer of Henry Ford for the Muscle Shoals property. We understand that you have had considerable to do with the development of the plants there, and the committee would be very glad to hear you in connection with the work that has been done down there. Will you kindly proceed in your own way?

Gen. WILLIAMS. Mr. Chairman, the Muscle Shoals project or enterprise is very clearly divided into two entirely separate and distinct parts; one has to do with the water power development and the other has to do with the installation of two nitrate plants, together with certain auxiliaries that go with those plants in order to make them complete.

With the water power question the Ordnance Department has not now nor has it ever had anything to do. That comes entirely under the Chief of Engineers.

As to the nitrate plants at Muscle Shoals the Ordnance Department, of course, has started those plants, built them, and brought them to their present state of development. The main facts concerning these two plants are briefly about as follows:

The first plant to be started down there is the one that we call plant No. 1 located at Sheffield, Ala. The plant was constructed to fix nitrogen from the air in accordance with what is known as the Haber process. It was designed and built by the General Chemical Co., but in a vital part of the plant it failed to operate and never produced any appreciable quantity of product. We think, however, that by certain modifications in the part of the process in which the nitrogen gas is welded to the hydrogen gas to form ammonia, the plant could be made to operate successfully. As a matter of fact, the plant at Sheffield was designed by the engineers who have since

designed, along the same lines, a successful plant which has been installed at Syracuse N. Y., by the Solvay Process Co. They of course had considerable experience in the design and attempted operation of the plant at Sheffield. Then the Solvay Co. spent a year and a half or two years in research work concerning this particular phase of this process, and they finally installed the plant at Syracuse, which Maj. Burns and myself visited this past summer and found to be working very successfully. It looks very much as though the plant was a very considerable success; unusually so for a new thing of this kind.

The various figures concerning the cost of the installation of No. 1 nitrate plant, etc., are contained in a memorandum that the Ordnance Department submitted to the Secretary of War, and forms an appendix to the letter from the Secretary of War to the Speaker of the House of Representatives, dated February 1, 1922. I do not know whether the committee would care to go into those figures again or not.

The CHAIRMAN. I do not recall that they were gone into in detail, but they are set out on page 23 of the document.

Gen. WILLIAMS. Yes, sir; they are set out in detail on page 23.

The CHAIRMAN. And the whole letter was introduced in the hearing yesterday, so that that is already a part of the record.

Gen. WILLIAMS. Yes, sir. I can state briefly the figures, if you care to have me do so.

The total cost of this plant has been \$12,887,941.31. The operation and maintenance of this plant to July 1, 1920, has cost \$794,359.85, making a grand total of \$13,682,301.16. This plant is included in the list of properties for which Mr. Ford proposes to pay the sum of \$5,000,000.

The CHAIRMAN. What do you mean by operation of the plant at Sheffield.

Gen. WILLIAMS. I should have said attempted operation. We attempted to run the plant to see if it would produce the material it was designed to produce, and it did not produce it satisfactorily.

The CHAIRMAN. But that much was expended in your effort to make the plant work?

Gen. WILLIAMS. Yes, and in maintenance of the plant since.

The other and main plant at Muscle Shoals is what we call the nitrate plant No. 2. This plant was designed to fix nitrogen from the air by the cyanamid process, and the plant has a rated capacity of 110,000 tons of ammonium nitrate per year. The plant was completed sufficiently to start operating just a very short time before the armistice. We continued the operation of the plant for a sufficient length of time and to a sufficient extent to demonstrate that it would produce the ammonium nitrate in the quantities that it was designed to produce. The investment in nitrate plant No. 2 is given on page 23 of the letter of the Secretary of War referred to before, and the total cost is shown to be \$67,555,355.09. The operation cost \$3,424,496.85, making a total of \$70,979,851.94. In addition, there was the cost of maintenance to July 1, 1921, of \$201,674.63.

At the time it was decided to install this plant there was a very great demand for nitrate of soda and also some question as to the sufficiency of this supply during the remainder of the war. The object of the Ordnance Department was to install a nitrate plant which it felt absolutely certain, or as certain as one could be, would operate and produce. The cyanamid process was a very well known process and also was in successful operation in this country.

The CHAIRMAN. In successful operation in this country?

Gen. WILLIAMS. Yes, sir; part of the process was operating in this country.

The CHAIRMAN. Where else was it being produced?

Gen. WILLIAMS. In Canada and in this country together, as well as in several European countries.

The CHAIRMAN. By private concerns?

Gen. WILLIAMS. By a private concern in Canada and in this country, not on such a large scale as the No. 2 nitrate plant, but on a sufficient scale to be sure that they would be able to design a plant of this size and successfully operate it.

The CHAIRMAN. When you say in Canada, do you mean at Niagara Falls?

Gen. WILLIAMS. Making use of the water there, I think, at Niagara Falls, for the purpose of making the calcium carbide and the cyanamid, and then there was another portion of the plant situated within the United States itself which transformed the cyanamid to other nitrogen products.

The No. 2 nitrate plant was designed and built, and, as I said before, had just come into operation and had been nearly finished at the time of the armistice.

The CHAIRMAN. Is that plant completely finished at the present time?

Gen. WILLIAMS. It is practically ready to operate at the present time. The power plant, the quarry, and the plant itself, in fact the whole thing, forms one unit and is ready to operate.

The next one of the properties we have down there included in Mr. Ford's offer is the Warrior power station and the Warrior-Sheffield transmission line.

When it was decided to install in the nitrate plant No. 2 the cyanamid process, it was known, of course, that a very considerable amount of power would be necessary. To have built a power station of the size that was needed would have taken a longer time than to install the other portions of the process, so that the matter was taken up with the Alabama Power Co. I should say that the whole power situation down there was looked into very carefully, and it was found that the quickest results in the way of obtaining power could be had by a contract with the Alabama Power Co. They had in progress of construction or had just completed at that time, I think, a plant at Gorgas, on the Warrior River, some 88 miles from nitrate plant No. 2. The Ordnance Department made arrangements whereby an extension to their plant should be completed for the account of the Ordnance Department and be the property of the Ordnance Department, subject to certain conditions.

A question has arisen concerning an obligation on the part of the United States to sell this plant to the Alabama Power Co. There is no question in my mind but what a moral obligation exists on the part of the Government to deal with the Alabama Power Co., as is stated in the contract. The lawyers say that there is not a legal option there. In our opinion there certainly is a moral one.

The CHAIRMAN. Could you state to the committee why, in your opinion, there is not a legal obligation, but only a moral obligation?

Gen. WILLIAMS. I am not sufficiently familiar with the law, Mr. Chairman, to enter into a legal discussion of it. The Acting Judge Advocate General is here, and he could give you a much better analysis of it than I can.

The CHAIRMAN. We will ask the Judge Advocate General about that when he makes his statement. State why, in your opinion, there is a moral obligation.

Gen. WILLIAMS. The Government found itself very greatly in need of power. The Alabama Power Co. had already projected this extension, and all their plans had been drawn, and they came to the assistance of the Government at a critical time, putting at its disposal their facilities and the plans which they had already made.

The CHAIRMAN. And those facilities and plans were accepted by the Government?

Gen. WILLIAMS. They were accepted by the Government.

The CHAIRMAN. And have been used ever since by the Government, have they?

Gen. WILLIAMS. They were used for a while by the Government in the operation of the plant at Muscle Shoals, and they have since been leased to the Alabama Power Co. We entered into a very definite agreement with the Alabama Power Co., and so far as we are concerned, we believe that that agreement should be carried out.

The CHAIRMAN. What was that agreement?

Gen. WILLIAMS. The agreement is contained in the contract, Mr. Chairman. The agreement is contained in article 22 of contract T-69, which I can give to the committee and enter on the records if you care to have that done.

The CHAIRMAN. I feel confident the committee would like you to put that contract into the official record of the hearings.

Gen. WILLIAMS. I will be glad to do so. [Later put in record by Col. Hull; see p. 150.]

This covers the main properties that the Ordnance Department is interested in at Muscle Shoals.

The CHAIRMAN. Is that contract with the Alabama Power Co. quite long?

Gen. WILLIAMS. Yes, sir; it is a long contract.

The CHAIRMAN. And was signed by the Alabama Power Co., by James Mitchell, its president, for the power company, and for the United States of America by William Williams, lieutenant colonel, Ordnance Department, United States Army, contracting officer, and was witnessed by C. F. Beames and Frank D. Mahoney.

Is that all you have to submit, General?

Gen. WILLIAMS. Yes, sir; that is all I have to say, sir.

The CHAIRMAN. Article 22 of this contract relates to the sale to or purchase by the contractor; are you familiar with article 22 personally?

Gen. WILLIAMS. Yes, sir; I know the general contents of it.

The CHAIRMAN. Would you kindly explain to the committee what you understand by that article?

Gen. WILLIAMS. Mr. Chairman, Col. Burns has been handling this whole question with the Alabama Power Co., and he can explain it to the committee very much better than I can, in that he is very much more familiar with the details, and I should be very glad if you would permit him to do the explaining rather than have me do it.

The CHAIRMAN. We will be very glad to hear from Maj. Burns.

Maj. BURNS. Mr. Chairman, that article is quite complicated. It is so complicated that most of us have really hesitated to summarize it, and if I could escape a summary of it, I should be very glad. However, the gist of it is that at a certain period after the war is terminated, it is agreed that we will sell to the Alabama Power Co. the properties of all kinds that are included in the contract, at a price to be determined by a board of arbitrators, one arbitrator to be selected by the Alabama Power Co., one to be selected by the Government, and the third to be selected by the other two. That is the substance of it. There are many complications as to time and other things that I think would confuse the committee.

The CHAIRMAN. In what way?

Maj. BURNS. 'If I read it, I believe I could bring out the points.

The CHAIRMAN. I think it is sufficiently important to have it read at this time.

Maj. BURNS (reading):

"ARTICLE XXII.

"*Sale to or purchase by contractor.*—(1) At any time subsequent to three years after the termination of the war, the United States shall have the option to sell to the contractor and the contractor shall upon written demand of the United States buy all its rights, title, and interest in and to the Warrior extension and Warrior substation with all rights appurtenant thereto at the value fixed by arbitration as hereinafter provided. The accumulated fund referred to in Article XIX shall be applied in payment of said value, and any excess of said fund over said value shall be paid over to the contractor: *Provided*, That if the actual cost of Warrior extension and Warrior substation to the United States shall exceed said value, then only the excess of said fund over said cost shall be paid over to the contractor. If said value shall exceed said fund, then the contractor shall pay to the United States the excess in the manner hereinafter provided. As soon as the amount of said value shall be paid or secured as in this article provided, the United States shall convey all of its right, title, and interest in and to said properties to the contractor.

"(2) If and when said accumulated fund shall be equal to or greater than the actual cost to the United States of the Warrior extension and the Warrior substation, the contractor may demand that the United States convey all of its right, title, and interest in and to said properties to the contractor and that it pay over to the contractor the excess, if any, of said fund over said cost, retaining the balance. The United States shall comply promptly with such demand.

"(3) The contractor may also at any time demand that the United States convey to it all of the right, title, and interest of the United States in and to the Warrior extension and Warrior substation upon payment to the United States of any excess of the actual cost of said properties over the amount of said accumulated fund then in the possession of the United States. And upon payment to the United States of such excess the United States shall comply with said demand, retaining the whole of said accumulated fund.

"(4) At any time after December 1, 1926, or such earlier period as the United States shall finally cease to take energy under this contract, said accumulated fund being less than the actual cost to the United States of the Warrior extension and Warrior substation, the contractor may demand that the value of said properties be fixed by arbitration; and

"(a) If the value so fixed is equal to or less than the amount of such accumulated fund, then the United States shall convey to the contractor all of its right, title, and interest in and to said properties by proper instruments in writing within 60 days after notice of the award, retaining in payment the whole of said fund.

"(b) If the value so fixed be greater than said fund then the United States shall upon payment by the contractor of the amount by which such value is greater than said fund, or payment thereof being secured as hereinafter provided, convey all of its right, title, and interest in and to said properties to the contractor by proper instruments, in writing, within 60 days after notice of the award, retaining in payment the whole of said fund.

"(5) In the event that the contractor shall on demand of the United States fail or refuse to purchase the Warrior extension and Warrior substation under any of the foregoing subdivisions of this article, the United States may sell the same to another subject to the conditions that said properties shall not be operated and that they shall not be removed within six months after the sale has been consummated. Upon the consummation of such a sale with another purchaser the United States shall pay over to the contractor the whole of said accumulated fund, less the amount, if any, by which the actual cost of the said properties shall exceed the price realized from such sale.

"(6) In the event that (a) the Warrior extension and Warrior substation are not sold in the manner herein provided to the contractor or to another within the period of 10 years referred to in Article XV or (b), said properties not having been so sold, the United States or its said successor shall cease for 365 consecutive days to take any energy from the Warrior extension, the United States shall, upon six months' notice in writing from the contractor, remove the Warrior extension and Warrior substation from the lands of the contractor unless it shall within 90 days after receipt of such notice proceed to exercise its option under subdivision (1) of this article. In the event of removal pursuant to such notice, the United States shall leave the premises in a neat and workmanlike condition and shall pay over to the contractor the entire amount of the said accumulated fund then in its possession.

"(7) If the United States or its said successor shall for a period of two consecutive years fail to take energy from the Warrior extension, and in any event at the expiration of said period of 10 years, the United States shall, upon 6 months' written notice from the contractor, remove such of said transmission lines and appurtenances owned by it as are located on land or rights of way owned by the contractor: *Provided*, That upon receipt of any such notice the United States may require the contractor to purchase all of its right, title, and interest in and to said transmission lines and their appurtenances at their fair value as fixed by arbitration.

"(8) The contractor shall have a period of 5 years in which to make payment of any amounts due the United States under subdivisions (1) and (4) of this article over and above said accumulated fund: *Provided*, That all deferred payments shall be secured in a manner satisfactory to the Chief of Ordnance. During such period the contractor shall pay to the United States interest on deferred payments at the rate of 5 per cent per annum. At the request of the contractor said period shall be extended two and one-half years, interest during such extended period to be at the rate of 6 per cent per annum. The contractor may anticipate any deferred payment in whole or in part.

"(9) The value of said properties to be determined under this article shall be their fair value and it shall be fixed by arbitration under Article XXIV.

"(10) Actual cost under this article shall be computed as provided in Article XI."

The CHAIRMAN. After having read the article, would you desire to pass upon the various features of it for the benefit of the committee?

Maj. BURNS. I would like to say that the accumulated fund which is referred to constantly in that article never started because of the fact that we purchased very little power under the contract; in fact, I do not think we purchased any under the contract because of the stoppage of the war at about the time we were ready to operate, so that is a dead letter, in a way; but I really prefer not to try to interpret the whole article.

The CHAIRMAN. The Acting Judge Advocate General being the law officer of the War Department can probably pass upon that when we reach him.

Gen. WILLIAMS, what do you think about the offer of Mr. Ford of \$5,000,000 for these properties which you have shown cost the Government approximately \$85,000,000?

Gen. WILLIAMS. Taking the money alone and leaving out of consideration any advantages that come to the Government because of the operation of the plant by Mr. Ford, I should say that \$5,000,000 for these properties is a very inadequate sum.

The CHAIRMAN. Will you explain why you think so?

Gen. WILLIAMS. Because the estimated scrap value of these properties is \$8,812,000, and if arrangements be made to operate certain portions of them and scrap the remainder, the estimated value is \$16,272,000. Mr. Ford is getting these properties, a clear title to them, in accordance with his offer, for \$5,000,000, and that to my mind is an inadequate sum, leaving out of consideration, as I say, any benefits that would accrue to the United States from Mr. Ford operating this plant continuously under his contract for the period of the lease.

The CHAIRMAN. In scrapping the property of the Government that we accumulated during the war, have you found that your estimates were not reached in the realization of the amount that you had estimated on the property. For instance, you say you have figured out that these plants could be scrapped with a value of \$8,000,000; that is only an estimate on your part?

Gen. WILLIAMS. It is only an estimate, that is very true; but it is based, however, on our experience with other large properties that we have salvaged, and it is our best judgment as to what may be obtained. Now, it may or may not be realized.

The CHAIRMAN. In effect, then, your estimate is only a matter of your judgment.

Gen. WILLIAMS. That is all.

The CHAIRMAN. You might not receive even \$5,000,000.

Gen. WILLIAMS. That is entirely possible.

The CHAIRMAN. The committee will probably want to ask you some questions now.

Gen. WILLIAMS. Did you ask me if we think we may not receive \$5,000,000?

The CHAIRMAN. Yes.

Gen. WILLIAMS. I should say almost positively we will receive more than \$5,000,000. We may not realize the \$8,000,000 or almost \$9,000,000 that we have estimated, but we believe without any question we would realize more than \$5,000,000.

The CHAIRMAN. I also asked whether you knew you would receive the \$8,000,000.

Gen. WILLIAMS. That we do not know.

Mr. McKENZIE. General, the estimate made by the Ordnance Department of the salvage value of these plants, of course, brings in speculative or problematical questions, does it not?

Gen. WILLIAMS. Yes.

Mr. McKENZIE. In other words, you are not sure whether you can get \$8,000,000 or \$4,000,000 if these plants are sold for scrap?

Gen. WILLIAMS. We are not sure we could get \$8,000,000, of course, and that is based upon our judgment as to the present market we would have to sell it in.

Mr. McKENZIE. It is a problematical proposition?

Gen. WILLIAMS. It is.

Mr. McKENZIE. And this much can be said of Mr. Ford's offer, it is a definite, fixed offer of \$5,000,000.

Gen. WILLIAMS. Yes.

Mr. McKENZIE. So we know what he is willing to pay for these various plants.

Gen. WILLIAMS. Yes.

Mr. McKENZIE. Now, General, I want to ask you just one or two questions in connection with the purpose of this whole proposal. When the law was enacted in 1916 there were several things taken into consideration in writing the legislation, but as I remember—and I was a member of the committee at that time, and helped to write the legislation—the main contention at that time was to enact legislation that would enable the Government to establish, not at Muscle Shoals particularly, but at some point or points within the United States, certain plants for the manufacture of nitrate to be used in preparation for war in the manufacture of munitions and, as I understood it, that was the primary purpose of the legislation; am I right about that?

Gen. WILLIAMS. That is the way I understand it, sir.

Mr. McKENZIE. It was also understood in connection with that proposition that the War Department would have unquestioned jurisdiction?

Gen. WILLIAMS. Yes, sir.

Mr. McKENZIE. And you have handled it as the representative of the Ordnance Department?

Gen. WILLIAMS. Yes, sir.

Mr. McKENZIE. Another proposition involved was the development of the river for navigation purposes: that is, in developing the water power which could be utilized in the manufacture of nitrate navigation was taken into consideration as a secondary proposition, over which the War Department also has jurisdiction.

Gen. WILLIAMS. Yes.

Mr. McKENZIE. And the third proposition involved, which at that time was understood to be incidental, was that these plants when established and not being used for the manufacture of nitrates to be used in the munitions of war the Government could utilize the plant in the production of nitrates to be used as one of the elements in the production of fertilizer to be used on the farm; am I right about that?

Gen. WILLIAMS. I understand so, sir.

Mr. McKENZIE. Of course, at that time, the manufacture of nitrates to be used for munitions was the primary and basic proposition.

Gen. WILLIAMS. Yes.

Mr. McKENZIE. Of course, the Great War having been fought and with the prospect of a number of years of peace ahead of us—we all hope so at least—and with no real necessity for the operation of these plants for the production of nitrates for munitions, they could be advantageously used for the manufacture of this element of fertilizer which could be sold to the farmers of the country, and while, as a matter of fact, in the inception of this proposition the manufacture of fertilizer was incidental, yet at the present time when we are at peace, the manufacture of fertilizer becomes, perhaps, the most important proposition, and to that is attached the condition, even under Mr. Ford's proposition, that the plant shall be maintained continuously in such a condition so that in case of war or in case the Government needs it in any way for the manufacture of munitions it can be immediately turned over to the Government as a matter of national defense and preparedness.

Gen. WILLIAMS. Yes.

Mr. McKENZIE. And to that extent it would be under the supervision and jurisdiction of the War Department; am I right about that?

Gen. WILLIAMS. Yes, sir.

Mr. McKENZIE. Now, I just want to ask one or two questions about this contract. The contract with the Alabama Power Co., as I understand it, was entered into between that company and representatives of the Ordnance Department?

Gen. WILLIAMS. Yes, sir.

Mr. McKENZIE. And as I understand it, the Alabama Power Co. owns all of the land over which this transmission line extends, owns the land where the plant is constructed, and is referred to in the contract as the contractor. Am I right about that?

Gen. WILLIAMS. Yes, sir.

Mr. McKENZIE. The Government put up that money to build that plant and to build the transmission line, as I understand it?

Gen. WILLIAMS. Yes, sir.

Mr. McKENZIE. Was that plant built on what is now, perhaps, not the famous but the infamous cost-plus contract system?

Gen. WILLIAMS. I think it was, Mr. McKenzie; with a limit as to total fee to be paid to the contractor.

Mr. McKENZIE. At any rate, the Alabama Power Co. simply got the money from the Government, constructed the plant, built the transmission line, entered into a contract to sell back to the Government electric current for its use at this plant for the manufacture of nitrates.

Gen. WILLIAMS. Yes.

Mr. McKENZIE. As I understand it, notwithstanding the law of 1892, the Ordnance Department entered into a contract giving these people an option to purchase this property that the Government has built at its own expense. Am I right about that?

Gen. WILLIAMS. Yes, sir; I think so.

Mr. McKENZIE. It was built at the exclusive expense of the Government, and that is one of the propositions with which we are confronted at this time, the Alabama Power Co. claiming to have certain equities and that we can not enter into a legal contract with Mr. Ford or anyone else until we first settle with them when, if the statute of 1892 is still in force, they have not any standing in court, and it is so stated by the department of the Judge Advocate General: but as I understand you, knowing you to be always fair and charitable to all mankind, notwithstanding you are an officer of the Army and supposed to be somewhat Prussianized, you feel we ought to take the claim of the Alabama Power Co. into consideration and at least treat them equitably and justly in case we go on with this proposition.

Gen. WILLIAMS. I think so.

Mr. McKENZIE. That is all I want to ask you, General, at this time.

Mr. HULL. In speaking of scrapping or salvaging these plants, I presume that means the Government would lose its capacity to produce nitrates for war purposes, if they did that, would it not?

Gen. WILLIAMS. The \$3,812,000 includes the scrapping and consequent destruction of the nitrate plant No. 2 which wipes out the capacity to produce.

Mr. HULL. As a matter of fact, is not that a perfectly unthinkable proposition from the national preparedness standpoint.

Gen. WILLIAMS. Mr. Hull, I do not put that forward as a recommendation. I put that forward simply as a statement of the money that could be obtained from these plants under certain conditions. In so far as the Ordnance Department is concerned, it feels it is vitally interested in the question of the fixation of nitrogen; that it is a measure of preparedness that it must use every endeavor to see brought about, and, in so far as we are concerned, the guaranty of Mr. Ford to keep that plant in operation during the term of his lease is a matter of vital importance to us.

Mr. HULL. And instead of recommending that we scrap them you would positively be opposed to that proposition?

Gen. WILLIAMS. I should be opposed to that proposition, and I have not made any recommendation that they be scrapped. I am simply stating what would happen if they were scrapped.

Mr. HULL. And your opinion of this is all from the national defense standpoint?

Gen. WILLIAMS. Exactly so; and whether or not Mr. Ford's offer is accepted, the Ordnance Department should most earnestly recommend that nitrate plant No. 2 be maintained in a stand-by condition whether operated or not.

Mr. HULL. Mr. Ford's proposition positively agrees to keep these plants in working conditions?

Gen. WILLIAMS. Very true, and from that point of view it is a very great advantage to the Ordnance Department.

Mr. HULL. And about \$11,000,000, you estimate, is what the Government would be paying for that measure of preparedness?

Gen. WILLIAMS. That is the statement we make at the end of our report.

Mr. HULL. In your opinion is that too much or too little to pay to be prepared with nitrates?

Gen. WILLIAMS. I think that is a very moderate sum.

Mr. HULL. You are selling some water power at the present time from Dam No. 2, are you not?

Gen. WILLIAMS. No, sir; Dam No. 2 is not completed. There is no water power at Muscle Shoals at the present time.

Mr. HULL. I thought something was said yesterday about some power being sold.

Gen. WILLIAMS. That was steam power. We have leased the steam power plant at the nitrate plant No. 2.

Mr. HULL. That is steam power?

Gen. WILLIAMS. Yes, sir.

Mr. HULL. What are you getting for that?

Gen. WILLIAMS. \$120,000 a year, I think, is guaranteed, and then there is a certain other return dependent upon the amount of power that is supplied.

Mr. HULL. You spoke of the cost of the changes in plant No. 1, what would be the estimated cost, approximately, of the changes necessary to make that a working plant?

Gen. WILLIAMS. We estimate that to change this plant over so as to retain its present capacity of 22,000 tons of ammonium nitrate a year would cost about \$4,000,000.

Mr. HULL. And there would not be much doubt, if we did that, but what it would be a successful plant, inasmuch as you have seen a plant in this country working that is made on the plan that you would adopt for plant No. 1.

Gen. WILLIAMS. We believe it could be done successfully.

Mr. HULL. Where do we get nitrates at the present time, and as you go along, I wish you would state how much, for instance, we get from Chile, or what is the approximate amount that is imported at the present time.

Gen. WILLIAMS. We have prepared a chart in which is embodied the best statistics we could find concerning the consumption of inorganic nitrogen and the various sources of supply. I can put that chart into the record.

Mr. HULL. That would show, would it not, all the sources for nitrates at the present time with the approximate amount we are getting from those sources?

Gen. WILLIAMS. Yes, sir.

Mr. HULL. That would include the coal-tar process and all the others?

Gen. WILLIAMS. Yes, sir.

Mr. HULL. I wish you would put that chart into the record.

Gen. WILLIAMS. Yes, sir. (See p. 75.)

Mr. HULL. You spoke of a moral obligation to the Alabama Power Co. If we made a contract with the Alabama Power Co. and we asked them to carry out certain provisions of it and they did not carry them out, would there be any moral obligation on our part to carry out the written contract?

Gen. WILLIAMS. I do not think I am entirely competent to explain the legal complications involved in these contractual relations.

Mr. HULL. That is not a legal question; that is a moral question. You took up the question of the moral obligation, and I would like to have your opinion of that as a moral obligation only.

Gen. WILLIAMS. So far as I know, the condition you specify does not exist.

Mr. HULL. If it did exist?

Gen. WILLIAMS. I would rather not answer a question that is purely and simply supposititious.

Mr. JAMES. General, what was the exact date of that contract?

Gen. WILLIAMS. With the Alabama Power Co.?

Mr. JAMES. Yes.

Gen. WILLIAMS. The contract was signed in November, 1918, but it was negotiated in 1917 and 1918.

Mr. JAMES. Was that contract ever submitted to the Judge Advocate General's office for approval?

Gen. WILLIAMS. I do not know, sir, whether it was or not.

Mr. JAMES. Do you not think that all important matters when the Government is practically giving away money should be first submitted to the Judge Advocate General's office before we get into trouble and not afterwards?

Gen. WILLIAMS. No, sir; I do not, because we had during the whole time this contract was negotiated some of the best lawyers in the country who were employed on this kind of work, and I should very much object, in so far as the operations of the Ordnance Department are concerned, to first call upon the Judge Advocate General for approval before we could make a contract. Nothing would slow up business more.

Mr. JAMES. Did some of those lawyers approve of this contract?

Gen. WILLIAMS. They did, and it was negotiated by lawyers.

CONSUMPTION AND SUPPLY OF INORGANIC NITROGEN

IN UNITED STATES 1900-1920

CONSUMPTION IN EACH YEAR TAKEN EQUAL TO NET SUPPLY FOR THAT YEAR AS DATA LACKING FOR STOCKS ON HAND AT END OF YEAR.

FIG. 1.

Mr. JAMES. When these negotiations were entered into, the war was on?

Gen. WILLIAMS. The war was on; yes, sir; in 1917.

Mr. JAMES. Under the war powers, did we not have the right to take any property or anything else that the Alabama Power Co. had that we wanted?

Gen. WILLIAMS. I think we did have the legal right to do that, but it was a right that was very, very seldom exercised; only in the most exceptional cases.

Mr. JAMES. If we had carried out that legal right which we had at that time we would not be in this controversy with the Alabama Power Co.

Gen. WILLIAMS. But the properly constituted agents of the Government did make this contract with the Alabama Power Co., and that is the fact we are confronted with.

Mr. KEARNS. General, the Air Nitrates Corporation has something to do with Muscle Shoals, has it not?

Gen. WILLIAMS. The Air Nitrates Corporation, I think, was the company we made the contract with to build nitrate plant No. 2.

Mr. KEARNS. How many men compose that corporation?

Gen. WILLIAMS. I do not know, sir.

Mr. KEARNS. Is it not a fact that there are only 10 of them?

Gen. WILLIAMS. I have no idea whatever.

Mr. KEARNS. And they only put in a capital of \$100 apiece?

Gen. WILLIAMS. I do not know.

Mr. KEARNS. And that they are capitalized for \$1,000?

Gen. WILLIAMS. I do not know.

Mr. KEARNS. And they have already made \$2,000,000 out of this proposition, and they still have other claims pending against the Government, have they not?

Gen. WILLIAMS. I know nothing about their profits.

Mr. KEARNS. They still claim some interest in Muscle Shoals, do they not?

Gen. WILLIAMS. They, or rather their parent company, the American Cyanamid Co., have certain royalty rights.

Mr. KEARNS. And it is a corporation composed of 10 men with an investment of \$100 each, and they have already made at least \$2,000,000 out of it.

Gen. WILLIAMS. I do not know about that.

Mr. KEARNS. Your department has had control of the Muscle Shoals operations, has it not?

Gen. WILLIAMS. I know nothing about their profits.

Mr. KEARNS. Whatever profits they have made have been paid to them by the United States Government?

Gen. WILLIAMS. They have been paid to them by the United States Government?

Mr. KEARNS. Yes.

Gen. WILLIAMS. We had a contract with them; what profit they made out of the contract I do not know, just as I do not know the profits that other people make out of their contracts.

Mr. KEARNS. I believe it is a fact that the Alabama Power Co. was in charge of Muscle Shoals at the time the Government took over the project?

Gen. WILLIAMS. I think they did have some land holdings there at the time the Government became interested in that plant.

Mr. KEARNS. Did they have any activities that they were operating there at the time?

Gen. WILLIAMS. Not so far as I know.

Mr. KEARNS. What was there at Muscle Shoals before the Government took it over?

Gen. WILLIAMS. In so far as the actual use of the waterpower was concerned, nothing was being done as far as I know; there was no activity that corresponded to the United States nitrate plant No. 1 or the United States nitrate plant No. 2.

Mr. KEARNS. Was the Alabama Power Co. carrying on any activity of any kind at Muscle Shoals when the Government took it over?

Gen. WILLIAMS. Not so far as I know.

Mr. KEARNS. What did the Alabama Power Co. have to sell to the Government—just the land?

Gen. WILLIAMS. We may have bought some land from them; I think possibly they did have some holdings there.

Mr. KEARNS. How did the Alabama Power Co. come to have this contract with the Government?

Gen. WILLIAMS. Because they were so situated that they could build a sufficient power plant and deliver power to the Government quicker than anybody else could do it, in so far as we knew.

Mr. KEARNS. They had no activity there of any kind?

Gen. WILLIAMS. No; but the plant they built is 88 miles from plant No. 2, and we had a transmission line to bring the power to nitrate plant No. 2.

Mr. KEARNS. I am trying to find out just what water rights the Alabama Power Co. had there at the time the Government took it over. What was the Alabama Power Co. doing, and what did the Government buy from it?

Gen. WILLIAMS. I do not know what they were doing at Muscle Shoals. So far as I know, they were not doing anything.

Mr. MILLER. General, I want to ask you a few questions in regard to this contract. This contract relating to the erection of the station at the Warrior steam plant, which Maj. Burns read, with the clauses in it giving the Alabama Power Co. a prior right to purchase, was drawn under the law of June 3, 1916, was it not?

Gen. WILLIAMS. Is that the reorganization act of June 3, 1916? Not so far as I know; I should think it had nothing to do with it.

Mr. MILLER. Under what law was the contract drawn?

Gen. WILLIAMS. I do not know under what law it was drawn.

Mr. MILLER. I will read that portion of the act of June 3, 1916, which authorizes the President of the United States to erect nitrate plants. It says:

"The President of the United States is hereby authorized and empowered to make, or cause to be made, such investigation as in his judgment is necessary to determine the best, cheapest, and most available means for the production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers and other useful products by water power or any other power as in his judgment is the best and cheapest to use; and is also hereby authorized and empowered to designate for the exclusive use of the United States, if in his judgment such means is best and cheapest, such site or sites, upon any navigable or nonnavigable river or rivers, or upon the public lands, as in his opinion will be necessary for carrying out the purposes of this act; and is further authorized to construct, maintain, and operate, at or on any site or sites so designated, dams, locks, improvements to navigation, power houses, and other plants and equipment or other means than water power as in his judgment is the best and cheapest, necessary or convenient for the generation of electrical or other power and for the production of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizers and other useful products."

Then further along in the same section it is provided:

"The sum of \$20,000,000 is hereby appropriated, out of any moneys in the Treasury not otherwise appropriated, available until expended, to enable the President of the United States to carry out the purposes herein provided for.

"The plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital."

Gen. WILLIAMS. Not a cent of money carried in that act was used in this enterprise. It was paid for out of the appropriation for armament and fortifications.

Mr. MILLER. Then it was not provided for under this act?

Gen. WILLIAMS. No.

Mr. MILLER. United States plants No. 1 and No. 2 were installed by the use of the money provided for in this fund, were they not?

Gen. WILLIAMS. No, sir, they were not.

Mr. MILLER. Out of the fund appropriated for fortifications?

Gen. WILLIAMS. Yes.

Mr. MILLER. Plant No. 2 was completed and ready for operation at the close of the war?

Gen. WILLIAMS. Yes, not long after the close of the war.

Mr. MILLER. When was this rock quarry at Waco purchased?

Gen. WILLIAMS. It was purchased after the war.

Mr. MILLER. How long after the war closed?

Gen. WILLIAMS. I should say about a year.

Mr. MILLER. Out of what fund was that purchased?

Gen. WILLIAMS. It was paid for out of the fortifications appropriation.

Mr. MILLER. The war was over, but still we acquired a rock quarry in connection with a plant for the manufacture of war munitions or nitrates.

Gen. WILLIAMS. We acquired facilities that were necessary to complete the plant.

Mr. MILLER. Did you understand you were authorized to go ahead and install a fertilizer plant there out of funds provided for the fortifications of the United States?

Gen. WILLIAMS. This was not done in connection with that fertilizer plant.

Mr. MILLER. The rock quarry was not purchased for that purpose?

Gen. WILLIAMS. No, it was—

Mr. MILLER (interposing). What was it purchased for?

Gen. WILLIAMS. In connection with the ammonium nitrate plant.

Mr. MILLER. What is used in that production?

Gen. WILLIAMS. The limestone is first converted into lime, and that is one of the raw materials for making the cyanamid.

Mr. MILLER. How much is used?

Gen. WILLIAMS. I think it requires 2,000 tons a day for the full operation of the plant.

Mr. MILLER. Two thousand tons of the stone?

Gen. WILLIAMS. Two thousand tons of the limestone.

Mr. MILLER. To make how many tons of the ammonium nitrates.

Gen. WILLIAMS. That is to make 110,000 tons a year.

Mr. MILLER. It requires 2,000 tons a day?

Gen. WILLIAMS. That is my recollection of the figures.

Mr. MILLER. This rock crushing plant at the quarry was used as a part of the appurtenances of that plant?

Gen. WILLIAMS. It was one of the facilities necessary to supply needed raw material for the cyanamid plant.

Mr. MILLER. Now, the process at plant No. 1, which you speak of, is a different process from that at plant No. 2?

Gen. WILLIAMS. Yes.

Mr. MILLER. That is the Haber process—the German process?

Gen. WILLIAMS. The German process modified by the General Chemical Co.

Mr. MILLER. It differs materially in the process of manufacture from the cyanamid process?

Gen. WILLIAMS. Completely.

Mr. MILLER. That plant was a failure?

Gen. WILLIAMS. It was a failure, that is, that part of it which is known as the Haber process; where the nitrogen was welded to the hydrogen; the other parts were entirely successful.

Mr. MILLER. But so far as the output is concerned—

Gen. WILLIAMS. So far as the output is concerned, it is a failure.

Mr. MILLER. Did it follow the correct Haber formula?

Gen. WILLIAMS. It was a modification of the Haber process.

Mr. MILLER. Who put in that modification?

Gen. WILLIAMS. The General Chemical Co. designed it. They had made certain experiments which had convinced them that they could modify it, as they thought, to produce a successful output.

Mr. MILLER. Was the option given to them to modify this process, with the understanding that the process had been in successful operation?

Gen. WILLIAMS. I do not know whether at that time anybody in this country knew enough about the Haber process to put it in directly, but so far as we could find out, the best informed people concerning this process were the General Chemical Co., and we made a contract with them in the light of the best information we had.

Mr. MILLER. And authorized them to put in the process—

Gen. WILLIAMS (interposing). That proved a failure.

Mr. MILLER. The Haber process is a successful process, is it not?

Gen. WILLIAMS. Quite so. At that time it was being worked in Germany, but there was no information here, so far as I know, in regard to it on which we could go ahead and build a plant.

Mr. MILLER. Who was the authority that designated that this Haber process should be installed at Plant No. 1?

Gen. WILLIAMS. It was done by the Chief of Ordnance, acting, however, under specific instructions from the Secretary of War and the President, who acted on the advice of the nitrate supply committee, a committee composed of leading engineers and scientists, among them Dr. Charles L. Parsons, an enthusiastic advocate of the Haber process and at that time chief chemist of the Bureau of Mines.

Mr. MILLER. Who was the Chief of Ordnance at that time?

Gen. WILLIAMS. Gen. Crozier was the Chief of Ordnance at that time. This process was a pioneer process, and it would have been rather extraordinary if it had come through without any troubles at all.

Mr. MILLER. At any rate the Government went into a \$12,000,000 venture which proved a failure?

Gen. WILLIAMS. Yes; but they were entirely justified in doing so, in my opinion.

Mr. MILLER. That is a question, as to whether the Government wants to go into it.

Gen. WILLIAMS. That is simply my personal opinion.

Mr. MILLER. Can that process there now be completed at a reasonable expense?

Gen. WILLIAMS. I think so.

Mr. MILLER. Can it not be turned into the cyanamid process?

Gen. WILLIAMS. Oh, no; it is entirely different.

Mr. MILLER. But it can be turned into a productive concern, in your judgment?

Gen. WILLIAMS. Yes; it could be.

Mr. MILLER. Out of what fund was the \$16,000,000 which was put into Dam No. 2 taken?

Gen. WILLIAMS. That was entirely out of the \$20,000,000 appropriated in the act you have just referred to.

Mr. MILLER. That came out of this \$20,000,000?

Gen. WILLIAMS. Yes, sir.

Mr. MILLER. That is the dam proposition?

Gen. WILLIAMS. Yes.

Mr. MILLER. General, you are acquainted somewhat with the manufacture of fertilizer?

Gen. WILLIAMS. I know nothing about the manufacture of fertilizers. The only thing we have gone into has been the production at Muscle Shoals in nitrate plant No. 2 of one of the essential components of fertilizers.

Mr. MILLER. Was the construction of Dam No. 3 at Muscle Shoals, or the proposed construction of it, for the purpose of furnishing power for either of these nitrate plants, plant No. 1 or plant No. 2?

Gen. WILLIAMS. No, sir; it was not necessary for that purpose.

Mr. MILLER. Any power produced at that time would have been merely for commercial purposes; that is, around the two nitrate plants, to sell or do whatever they wanted to do with it.

Gen. WILLIAMS. The continuous operation of nitrate plant No. 2 would require about 90,000 horsepower, and that would take up nearly all the primary power that would come from Dam No. 2.

Mr. MILLER. Then, so far as the continuation of nitrate plant No. 2 is concerned, that is, it being held in reserve and in readiness as a war preparedness measure, Dam No. 3 has no connection?

Gen. WILLIAMS. No, sir.

Mr. MILLER. The Warrior steam plant is 88 miles distant?

Gen. WILLIAMS. Yes, sir.

Mr. MILLER. And that furnishes the power to each of these nitrate plants, plant No. 1 and plant No. 2?

Gen. WILLIAMS. Yes, sir; but nitrate plant No. 1 has its own power plant; very little power is required in the Haber process, and that is one of its great advantages.

Mr. MILLER. Then, the power from the Warrior steam plant—

Gen. WILLIAMS (interposing). Will be needed principally at plant No. 2.

Mr. MILLER. Has plant No. 2 any local power plant?

Gen. WILLIAMS. It has a power plant which is almost of sufficient capacity to run it by itself. That power plant, however, was not expected to be entirely completed by the time its power would be needed by the remainder of the plant.

Mr. MILLER. That plant is still in existence?

Gen. WILLIAMS. It is there, and is now leased.

Mr. MILLER. And it is sufficient to operate plant No. 2?

Gen. WILLIAMS. Yes; practically so.

Mr. MILLER. Then the presence of the Warrior steam plant would be simply as a reserve power, and is of no practical use in operating plant No. 2?

Gen. WILLIAMS. It is not essential to plant No. 2, assuming that in case of emergency some 20,000 horsepower can be obtained over the transmission line from the Alabama Power Co.'s system.

Mr. MILLER. Then that can be disposed of without in anywise interfering with the output of plant No. 2, so far as fertilizer production is concerned?

Gen. WILLIAMS. Yes; because water power rather than steam power would be necessary to manufacture fertilizer commercially.

Mr. MILLER. That could probably be disposed of to the best advantage of any of these units around Muscle Shoals, could it not?

Gen. WILLIAMS. I should think probably so.

Mr. MILLER. What would be the difficulty, so far as preserving plant No. 2 as an element of national preparedness is concerned, in disposing of the Warrior steam plant?

Gen. WILLIAMS. There would be no difficulty.

Mr. MILLER. You have placed a pretty high value on the salvage of the plant, have you not?

Gen. WILLIAMS. Our figures there are based on information we got from the Federal Power Commission, in which they estimated that a plant of that kind was worth about \$100 per kilowatt.

Mr. MILLER. That would make the value how much?

Gen. WILLIAMS. About \$3,000,000.

Mr. MILLER. If we should dispose of the Warrior steam plant we would receive salvage to the amount of three-fifths of what Mr. Ford intends to give for the entire property, including the Warrior plant?

Gen. WILLIAMS. Yes, sir.

Mr. MILLER. If that can be done, it seems to me it would be rather imprudent to sell the whole thing for \$5,000,000, when you could sell a little angle of it for \$3,000,000.

Gen. WILLIAMS. According to our estimates, Mr. Ford could salvage everything except the nitrate plant No. 2, and get a sufficient return to make nitrate plant No. 2 stand him a cost of about \$400,000; in other words, almost give it to him.

Mr. MILLER. Do we own all of the right of way on the transmission lines from the Warrior plant to plant No. 2?

Gen. WILLIAMS. We do not own any of it.

Mr. MILLER. What would it probably cost?

Gen. WILLIAMS. We do not know.

Mr. MILLER. Have you estimated the probable cost?

Gen. WILLIAMS. No, sir; we have not.

Mr. MILLER. Who has estimated what that would be?

Gen. WILLIAMS. So far as I know, there has been no estimate made on that.

Mr. MILLER. Mr. Ford's contract presupposes that that would not only be acquired but paid for by the United States?

Gen. WILLIAMS. As I understand it, the United States must give him a clear title to all those properties.

Mr. MILLER. The cost of that would probably be a very substantial sum, would it not?

Gen. WILLIAMS. I should think so.

Mr. MILLER. According to Mr. Ford's contract the United States is also to pay any overflow damages at Dam No. 3, which your department estimated to be \$2,000,000, as I understand it?

Gen. WILLIAMS. That is the estimate of the Engineers.

Mr. MILLER. What I was getting at is this: The purchase of the transmission line from the Warrior steam plant to plant No. 2, a distance of 88 miles, adding also to that the expense to which the United States Government would be put for damages for the overflowing at Dam No. 3, would probably absorb the greater portion, if not all, of this \$5,000,000 that Mr. Ford is going to pay?

Gen. WILLIAMS. I should think it might.

Mr. MILLER. Then the United States Government would get nothing whatever in the shape of payment?

Gen. WILLIAMS. Practically nothing.

Mr. MILLER. But we can salvage the little unit down there at the Warrior plant for \$3,000,000 and get something out of it?

Gen. WILLIAMS. Yes, sir.

Mr. MILLER. And by eliminating Dam No. 3, that would eliminate the \$2,000,000 of consequential damages that would arise in the event of damage to that property?

Gen. WILLIAMS. Yes, sir.

Mr. MILLER. It would also eliminate about \$20,000,000 for the construction of that dam?

Gen. WILLIAMS. Yes, sir.

Mr. MILLER. And if that amount were put into the construction of the Wilson Dam you would have a completed dam that would generate how many horsepower?

Gen. WILLIAMS. It would generate about 100,000 primary horsepower.

Mr. MILLER. What do you mean by primary horsepower?

Gen. WILLIAMS. That means power available every day for 365 days in the year. 24 hours a day.

Mr. MILLER. At some periods of the year there would be in excess of that?

Gen. WILLIAMS. Yes, sir. The Engineer Department have figures in reference to the probable horsepower that could be developed.

Mr. MILLER. Then by eliminating Dam No. 3, selling this Warrior steam-power plant, and completing the construction of Dam No. 2, the Government would be way ahead in the deal, would it not?

Gen. WILLIAMS. It seems so to me.

Mr. PARKER. Gen. Williams, how much property does that option of the Alabama Power Co. cover?

Gen. WILLIAMS. I think there are about 15 acres at the Gorgas plant. You mean the value?

Mr. PARKER. No; I mean what property does it cover. Of course, it covers the Warrior steam plant and the transmission line.

Gen. WILLIAMS. It covers a total of \$4,979,382.33.

Mr. PARKER. What other property would be included in the purchase?

Gen. WILLIAMS. That is the portion of the building the United States put up at the Gorgas plant, the machinery put in there, the transmission line and the Warrior sub-station, and what was called the Drifton railroad.

Mr. PARKER. It does not cover plant No. 2?

Gen. WILLIAMS. It has nothing to do with plant No. 2 at all.

Mr. PARKER. It is only this extra power?

Gen. WILLIAMS. Yes, sir.

Mr. PARKER. And they have no option on plant No. 2?

Gen. WILLIAMS. Not a bit.

Mr. PARKER. If they take it, they would have to pay the cost of construction, under their contract?

Gen. WILLIAMS. The price at which they take it would be determined by a board of arbitrators, which would be formed as specified in the contract.

Mr. PARKER. That contract speaks about a fund; is there any such fund?

Gen. WILLIAMS. That fund was never started because we got practically no power from there.

Mr. PARKER. So that they would take it at a price based to some extent upon the cost of construction?

Gen. WILLIAMS. The price would be determined by the board of arbitrators.

Mr. PARKER. It would be practically a sale to them of this auxiliary plant and nothing else, not a sale of plant No. 2?

Gen. WILLIAMS. No, sir; not at all.

Mr. PARKER. And there is no fund to embarrass that at all?

Gen. WILLIAMS. I think not.

Mr. PARKER. At plant No. 2 you make nitrates. Did I understand you to say that nitrates went into the fertilizers, or do they have to be changed into sulphate of ammonia before they go into the fertilizer?

Gen. WILLIAMS. The ammonium nitrate which we make at the plant has a fertilizing value, and a very good one, but its physical characteristics are such that it is difficult to handle.

Mr. PARKER. It is dangerous to carry; it might explode?

Gen. WILLIAMS. It is rather difficult to explode, but it can be done. It was an explosion of that kind which occurred at the Morgan depot. But it is safe explosive to handle.

Mr. PARKER. Is it used in fertilizer, or is the sulphate used?

Gen. WILLIAMS. The sulphate is a staple ingredient of the fertilizer. The ammonium nitrate is used a good deal in blasting powders, and there is a considerable market for it there.

Mr. PARKER. That is a different thing. The ammonium nitrate is not used in fertilizer.

Gen. WILLIAMS. Only to a very limited extent, if at all.

Mr. PARKER. Have we any facilities for making ammonium sulphate?

Gen. WILLIAMS. No, sir; additional appliances would have to be installed to produce ammonium sulphate.

Mr. PARKER. How much money would that cost, for a capacity of 110,000 tons a year?

Gen. WILLIAMS. We estimate that the additional machinery required to produce ammonium sulphate to the capacity of the plant, 215,000 tons a year, would be about \$3,000,000.

Mr. PARKER. Ammonium sulphate is a very well-known article of commerce?

Gen. WILLIAMS. I understand so; yes, sir.

Mr. PARKER. What does it sell for at the present time?

Gen. WILLIAMS. It is now selling for \$50 a ton.

Mr. PARKER. That is the sulphate?

Gen. WILLIAMS. Yes, sir.

Mr. PARKER. If it was made there it would have to be sold to the fertilizer people because it is not used by itself?

Gen. WILLIAMS. That would be the market for it.

Mr. PARKER. You would have to rely upon such a market at \$50 a ton?

Gen. WILLIAMS. The present market price is perhaps subnormal.

Mr. PARKER. How much can you make nitrate for per ton?

Gen. WILLIAMS. You mean ammonium nitrate?

Mr. PARKER. Yes.

Gen. WILLIAMS. We estimate that by using steam power it will cost us \$96.92 per ton to make nitrate of ammonia; using the cheap waterpower we estimate it will cost us \$75.25 per ton.

Mr. PARKER. Does that include any overhead charges, or only the actual cost of manufacture?

Gen. WILLIAMS. It does not include any allowance for interest on the capital cost, for depreciation, obsolescence, taxes, or insurance.

Mr. PARKER. Or profit of any kind?

Gen. WILLIAMS. No profit, no.

Mr. PARKER. Nothing for interest, profit, taxes, insurance, depreciation, or repairs?

Gen. WILLIAMS. It includes repairs.

Mr. PARKER. But not depreciation?

Gen. WILLIAMS. No sir.

Mr. PARKER. Commercially then, you can not make it for much less than \$100 a ton?

Gen. WILLIAMS. I should think that would be about right.

Mr. PARKER. That is the nitrate. How much would be added to that cost in converting it into sulphate for getting sulphuric acid, and things of that kind?

Gen. WILLIAMS. We would not convert nitrate into sulphate of ammonia. The corresponding sulphate prices would be, using the steam power, \$58.70 per ton; and using water power, \$48.07 per ton.

Mr. PARKER. For the sulphate?

Gen. WILLIAMS. For the sulphate; yes, sir.

Mr. PARKER. So that that can be made cheaper than the nitrate?

Gen. WILLIAMS. Cheaper than the ammonium nitrate; yes, sir.

Mr. PARKER. Of course something ought to be added for depreciation.

Gen. WILLIAMS. That price was figured on the same basis as the other.

Mr. PARKER. Commercially, you would add at least 25 per cent for that?

Gen. WILLIAMS. I should say that was not unreasonable.

Mr. PARKER. So that would make it \$75 a ton, approximately, if made by steam power, and approximately \$62.50 per ton if made by water power?

Gen. WILLIAMS. Yes.

Mr. PARKER. It is now selling in the market for \$50 a ton?

Gen. WILLIAMS. Yes; but that is a very low price for it.

Mr. PARKER. It is low compared to what it was during the war.

Gen. WILLIAMS. And right after the war.

Mr. PARKER. What was the price before the war?

Gen. WILLIAMS. It averaged about \$60 a ton, I think.

Mr. PARKER. Your figures in both instances are rather higher than the figures showing the average price paid for it before the war.

Gen. WILLIAMS. Yes; if you add 25 per cent to your cost to manufacture.

Mr. PARKER. I added 25 per cent for contingencies. Any manufacturer would have to add something for that, and Mr. Ford proposes to add 8 per cent, by way of his profits?

Gen. WILLIAMS. Yes.

Mr. PARKER. How is this ammonium sulphate usually made—by this process or in some other way?

Gen. WILLIAMS. I think the largest sources of supply are the by-product coke ovens and the gas works. Those two constitute the principal sources of supply.

Mr. PARKER. They are by-products in the coke ovens and gas factories, so that anything they get out of it is to their advantage, and they can lower their prices if they have to, in order to meet the market.

Gen. WILLIAMS. I suppose so.

Mr. PARKER. Under those circumstances it does not seem to me that a very strong case is made out to the effect that fertilizer can be made much cheaper here than elsewhere.

Gen. WILLIAMS. We have never been able to make out such a case.

Mr. PARKER. You can not make out a case if fertilizer can not be made cheaper, or its ingredients can not be made cheaper at Muscle Shoals than at the coke ovens and the gas works.

Gen. WILLIAMS. Our estimates on the cost of ammonium sulphate produced at these plants does not lead us to believe that the cost of fertilizer can be materially cheapened.

Mr. PARKER. As I understand it, fertilizer contains only about 3 per cent of this material.

Gen. WILLIAMS. I do not know much about fertilizer, but I understand that there are three essential elements in it—phosphorous, potassium, and nitrogen. Now, the formula specifies a certain percentage of each of these elements contained in the fertilizer.

Mr. PARKER. What did fertilizer sell for before the war?

Gen. WILLIAMS. I suppose that would be a question of the formula on which it was made.

Mr. PARKER. I am getting at the practical end of it. You do not think the operation of this plant would materially reduce the cost of fertilizer, under these circumstances?

Gen. WILLIAMS. This plant would produce only one of the components of fertilizer.

Mr. PARKER. And not at a cheaper price than it can be produced elsewhere?

Gen. WILLIAMS. I do not think that we would find the cost of that component would be materially reduced.

Mr. HILL. General, Mr. Ford's offer includes nitrate plant No. 1, nitrate plant No. 2, the Waco quarry, and the Gorgas-Warrior steam plant?

Gen. WILLIAMS. Yes.

Mr. HILL. As I understand it, the question as to the possible rights of the Alabama Power Co. only apply to the Gorgas-Warrior steam plant?

Gen. WILLIAMS. And the transmission line.

Mr. HILL. The transmission line is included in the properties which Mr. Ford wishes to buy, and that would come under the head of the Gorgas-Warrior steam plant?

Gen. WILLIAMS. Yes.

Mr. HILL. Nitrate plant No. 1 is not in operation?

Gen. WILLIAMS. Neither one is in operation.

Mr. HILL. As a matter of national defense, nitrate plant No. 1 is not essential?

Gen. WILLIAMS. Nitrate plant No. 1 to-day, as a producing plant, has no value.

Mr. HILL. Mr. Ford does not propose to keep that up?

Gen. WILLIAMS. No; he does not.

Mr. HILL. Nitrate plant No. 2 is the one that it is proposed to keep up?

Gen. WILLIAMS. Yes; that is the only one.

Mr. HILL. The only inducement to the Government, from a national-defense point of view, so far as this office is concerned, is the upkeep of nitrate plant No. 2?

Gen. WILLIAMS. That is the one that is of material benefit to the Government.

Mr. HILL. Nitrate plant No. 2, as listed by Mr. Ford, is entirely self-sustaining; it has all its elements of power?

Gen. WILLIAMS. Yes.

Mr. HILL. Does it depend on Dam No. 2?

Gen. WILLIAMS. Of course, the cost of the product of nitrate plant No. 2 would be materially reduced by using the cheap water power that would come from Dam No. 2.

Mr. HILL. He could use this power so obtainable?

Gen. WILLIAMS. Yes; he would have the steam plant, and my guess would be that he would use the steam plant so that in time of low water he would materially increase the primary power and at the season of high water he would cut off the steam plant and let it lie inactive.

Mr. HILL. Is the Waco quarry essential to nitrate plant No. 2?

Gen. WILLIAMS. It is essential in that one of the raw materials used in the manufacture of the cyanamid comes from the quarry. That is, we take the limestone and make from it the lime which is used in the manufacture of carbide.

Mr. HILL. In answering a question asked you by Mr. Miller you estimated that that would take 2,000 tons a day?

Gen. WILLIAMS. That is for the whole operation of the plant.

Mr. HILL. I suppose that would be on a basis of 300 days a year?

Gen. WILLIAMS. Yes, sir.

Mr. HILL. To make 110,000 tons?

Gen. WILLIAMS. Yes.

Mr. HILL. That is, 600,000 tons altogether?

Gen. WILLIAMS. Yes.

Mr. HILL. Has it been estimated how long the quarry would be able to furnish that?

Gen. WILLIAMS. No definite estimate has been made, but there is a large amount of stone there.

Mr. HILL. The reason I asked that question is that it has a bearing on the matter of the term of the lease, whether it is 50 years or 100 years. It is not an outright purchase, but looking at it from a national-defense point of view, I wanted to find out whether the products of that quarry were available elsewhere in the vicinity. Is that material met with frequently in the neighborhood?

Gen. WILLIAMS. I think so. I am told by one of our officers that the exploration of Waco quarry so far made has disclosed a supply for 20 years, and the estimate is that there will be enough for 80 or 100 years.

Mr. HILL. But the products of the quarry are obtainable in the neighborhood for use?

Gen. WILLIAMS. I think so; yes.

Mr. WURZBACH. Are there any plants in Germany in successful operation which are using the Haber process at this time?

Gen. WILLIAMS. I think the plant at Oppau was using the Haber process.

Mr. WURZBACH. That was the plant that blew up some time ago?

Gen. WILLIAMS. Yes.

Mr. WURZBACH. You do not know of any other?

Gen. WILLIAMS. There is one at Merseburg.

Mr. WURZBACH. That is the only one which has used that process since the destruction of the plant at Oppau?

Gen. WILLIAMS. So far as we know.

Mr. FIELDS. General, referring to the discussion of the price of fertilizer, it is highly probable, is it not, that new developments and new compounds may materially reduce the cost of the production of fertilizer at this or any other point in the near future, with our present progress?

Gen. WILLIAMS. We do not produce fertilizer; we produce just one component. Now, it seems to me that the fixation of nitrogen from the atmosphere, in so far as I know it, is just really beginning.

The CHAIRMAN. You do not produce fertilizer?

Gen. WILLIAMS. No, sir; we produce only one ingredient of fertilizer. The question of the fixation of nitrogen is one that is being constantly studied in all of the scientific countries, and it is something that all recognize as essential. The supplies in Chile are being exhausted, and it probably will not be a great many years before they will no longer be able to supply the needs of the world. Therefore it is essential to develop this process. Just what is going to be the successful method, I do not believe anybody can say. The people who have studied the question all differ among themselves as to just what is the best process. They all agree that it is of great benefit; they all agree, I think, that some time or other in the not far distant future the fixation of nitrogen will be on a commercial basis, just as the production of pig iron, but nobody will dare to say what process is going to bring that out.

Mr. FIELDS. They all agree it is a proposition in which there are great possibilities?

Gen. WILLIAMS. Yes.

Mr. FIELDS. Taking the proposition at Muscle Shoals, the whole outfit down there, we have got to do one of five things: First, scrap it; second, operate it by the Government; third, maintain it in an idle, stand-by condition for the use of the Government in time of emergency; fourth, lease it to private individuals or a corporation; or fifth, let it rust down and become a wreck.

Let us take the propositions in their order. The War Department, as I understand, from the standpoint of national preparedness, is opposed to the scrapping of this plant?

Gen. WILLIAMS. Yes.

Mr. FIELDS. Under any circumstances?

Gen. WILLIAMS. Yes, sir.

Mr. FIELDS. Then the next proposition would be its operation by the Government. Probably the Secretary of War has made some suggestion along that line. I will ask you to prepare, if you have not already done so, an analysis covering the operation of plant No. 2 for a period of six years, we will say, by the Government, showing the cost of operation and the proceeds therefrom, including depreciation, etc., everything that a business concern would put into its operating computation.

Gen. WILLIAMS. I will have that prepared.

Estimate of results of operation by Government of United States nitrate plant No. 2, Muscle Shoals, Ala., for period of 6 years.

[Including fixed charges, etc., figured in accordance with commercial but not with Government accounting procedure.]

ESTIMATED RECEIPTS.

Salv of 6×215,000 tons of ammonium sulphate, at \$65 per ton..... \$83,850,000

ESTIMATED EXPENSES.

Cost, f. o. b. cars, of 6×215,000 tons of ammonium sulphate, assuming steam power used for 3 years and water power used for 3 years, at \$38.70 and \$48.07 per ton.....	\$68, 766, 650
Extra expense in building up business.....	1, 500, 000
Cost of maintaining portion of plant not used for sulphate manufacture..	180, 000
Depreciation on \$20,000,000 ¹ for 6 years, at 5 per cent.....	6, 000, 000
Interest on \$24,140,000 ² for 6 years, at 5 per cent.....	7, 242, 000
Taxes ³ on \$24,140,000 for 6 years, at 1½ per cent.....	2, 172, 600
Insurance on \$15,140,000 ⁴ for 6 years, at 1 per cent.....	908, 400
Total.....	86, 769, 650
Excess estimated expenses over estimated receipts.....	2, 919, 650

NOTE.

Estimated present value of plant.....	11, 640, 000
Estimated cost of sulphate of ammonia department, including storage buildings, etc.....	3, 500, 000
Estimated working capital needed.....	9, 000, 000

Mr. FIELDS. The third proposition is that of maintenance in an idle standby condition. What would be the annual cost of maintaining this plant in an idle condition? You are not prepared, I take it, to furnish an analysis of that kind at the present time?

Gen. WILLIAMS. We can give you the actual expenditures for its maintenance, because the plant had not been operated since it was closed down shortly after the armistice. For the fiscal year 1921 the cost of maintenance of that plant was \$201,674.33. For the fiscal year 1922 the cost of maintenance will be about \$125,000.

Mr. FIELDS. Does that include the receipts from the power company?

Gen. WILLIAMS. No, sir; that is the expenditure.

Mr. FIELDS. Then I would like to have you prepare an analysis showing the cost of the maintenance of this proposition for a period of 20 years in an idle stand-by condition. I believe it is stated in your report and also in the exhibit included in the Secretary's report to Congress, that depreciation and obsolescence would result in the whole thing becoming valueless in 20 years, if it were maintained in an idle, stand-by condition. I am asking for this in order to try to arrive at a correct estimate of what the cost to the Government would be for the period of the proposed lease to Mr. Ford, should the Government attempt to maintain this plant in an idle stand-by condition for preparedness.

Then, General, how long would it take, if the plant were maintained in this way, to secure an organization for the operation of the plant in time of emergency?

For the sake of comparison which we may want in the future in the consideration of this matter, I would like to have you put in the record the cost of the nitro plant in West Virginia, its estimated salvage value, and the price that the Government got for it. Also I would like to have you put in the same information in regard to the Old Hickory plant and the nitrate plant on the Ohio River, so we may understand or know whether these plants have brought the Government the estimated salvage value.

Gen. WILLIAMS. Yes, sir; I will put those statements in the record.

(The following statement was later furnished for the record:)

"(1) It is estimated that the cost of maintaining United States Nitrate Plant No. 2 in idle stand-by for a period of 20 years would average \$100,000 per year or \$2,000,000 for the 20-year period, plus \$2,000,000 for replacements, or a total of \$4,000,000 for the 20-year period.

"The estimate of \$100,000 per year for maintenance is based on maintenance cost for the present fiscal year taking into account savings made and to be made. The \$2,000,000 replacement estimate is made on the cost of those replacements which it appears now would have to be made, viz, the various vent stacks, practically all of

¹ Estimated cost to replace plant at end of 20 years by plant of equivalent capacity, using same or different process.

² Present value of plant plus cost of additional construction necessary to manufacture sulphate of ammonia, plus necessary working capital.

³ It has been stated that cyanamid plants are exempt from taxation in Alabama. The Ordnance Department does not know whether this is a fact, and taxes have been included in this statement.

⁴ Present value of plant plus cost of additional construction necessary to manufacture sulphate of ammonia.

which are too small to permit of painting inside; flashing where these stacks and others project through the roof; all rubber and the greater part of the leather conveyor and drive belting; helicoid conveyor casings; boiler tubes of the power houses and steam plant; a large amount of the piping; and much of the equipment of the acid area. Replacement expense will not start for possibly from 5 to 10 years and then in rather small amount, but will increase in such proportion that by probably the end of 20 years this expense per year will be prohibitive. While it is reasonably certain that these replacements will have to be made, it is also likely that there will be others which may amount to as much as \$7,000,000.

"(2) With the plant maintained in idle stand-by it is estimated that sufficient organization for emergency operation could be secured to start operation in one and one-half months, to start production in three months, and to reach capacity production in five months.

"(3) The smokeless power plant at Nitro, W. Va., cost \$60,631,400, but materials aggregating \$2,798,329 were sold or transferred from the plant prior to its sale. The estimated salvage value was placed at \$8,736,026. The sale price of the plant was \$8,551,000 plus a storage space of 67,500 square feet for two years valued at 25 cents per square foot per year or \$33,750.

"The Old Hickory plant cost \$84,912,000, but materials aggregating \$5,708,000 were sold or transferred from the plant prior to its sale. The estimated salvage value was placed at \$7,600,000. The sale price of the plant was \$3,505,000 plus a storage space of 866,000 square feet for five years valued at 25 cents per square foot per year, or \$1,082,500 for the five-year period.

"The nitrate plant near Cincinnati, Ohio, was never completed, but cost \$7,321,400 as far as completed. This plant has been retained by the War Department and is being used as a storage depot."

MR. QUIN. General, you are the Chief of Ordnance of the United States Army?

Gen. WILLIAMS. Yes, sir.

MR. QUIN. Let us see what difference there is between us. I am a Congressman of the United States, and we both represent the people. I believe we ought to accept this proposition of Mr. Ford. I do not think you believe we ought to accept it, do you?

As I understand it, this Congress ought to do the best thing for the American people. You start out with an investment of \$85,000,000 or a little more, which Mr. Ford proposes to take over. As I understand it, the estimate submitted by the Secretary of War, as well as your estimate shows that the scrap value which the Government could get out of these plants is something over \$8,000,000?

Gen. WILLIAMS. Yes, sir.

MR. QUIN. That includes the nitrate power plant No. 2?

Gen. WILLIAMS. It includes everything.

MR. QUIN. What did the Government, through you, pay the Alabama Power Co. for erecting nitrate plant No. 2, power plant No. 2?

Gen. WILLIAMS. The Alabama Power Co. had nothing to do with nitrate plant No. 2.

MR. QUIN. They had nothing to do with it?

Gen. WILLIAMS. No, sir.

MR. QUIN. What did you pay them for? What did they construct?

Gen. WILLIAMS. We made a payment to them amounting to \$4,789,938.34.

MR. QUIN. That was with a profit to them of 10 per cent upon the cost, was it not? That was one of the 10 per cent cost-plus contracts?

Gen. WILLIAMS. Six per cent, with a limit as to total fee.

MR. QUIN. Did they have a contract different from the contracts of these other fellows, General?

Gen. WILLIAMS. The percentage on the cost-plus contracts varied.

MR. QUIN. I would like you to get the exact information on that to show us exactly what those gentlemen got, because 4 per cent on \$4,000,000 makes quite a difference. This nitrate plant No. 2 and the power plant at No. 2 is proposed by Mr. Ford to be left intact, ready for operation, is it not?

Gen. WILLIAMS. Yes, sir.

MR. QUIN. In your estimate of what Mr. Ford is getting, aside from that, he is paying \$2,000,000 more than you estimate in your figures of \$8,000,000 as the scrap value.

Gen. WILLIAMS. I do not understand you.

MR. QUIN. Mr. Ford is offering to give the Government \$3,000,000 more, is he not?

Gen. WILLIAMS. I do not understand that at all.

Mr. QUIN. You have estimated the total scrap value at \$8,000,000 and a little over, have you not?

Gen. WILLIAMS. The total for everything as scrap is estimated as \$8,812,000.

Mr. QUIN. Close to \$9,000,000.

Gen. WILLIAMS. Mr. Ford gets a clear title to all the property represented by that amount.

Mr. QUIN. Except this nitrate plant No. 2 and power plant No. 2, which he leaves to the Government?

Gen. WILLIAMS. He gets a clear title to that.

Mr. QUIN. But he is to hold it in readiness for the use of the Government at any time?

Gen. WILLIAMS. He obligates himself under the contract to operate plant No. 2 for the purpose of fixing nitrogen, eventually for the purpose of producing fertilizer, but in such condition that it can produce explosives needed by the United States in the event of an emergency, so that it can be turned over to the United States.

Mr. QUIN. He obligates himself to keep that plant in working condition with the personnel and the officers there so that it may be turned over to the United States Government, or to the War Department, in case of emergency?

Gen. WILLIAMS. And to pay a profit of 8 per cent. He told the Secretary of War that unless he got 8 per cent profit he would not operate it.

Mr. QUIN. But he would have it ready, so that if somebody just blew a whistle everybody would go to work and turn out nitrates.

Gen. WILLIAMS. Nothing like that ever happened.

Mr. QUIN. That is what he says in this proposition. He does not use that language, but that is the effect of it, is it not?

Gen. WILLIAMS. No, sir; I do not think so. If that were all there were to the proposition of getting munitions, it would be a very simple proposition indeed.

Mr. QUIN. But that would be a part of it?

Gen. WILLIAMS. He will not make explosives there at all during this time.

Mr. QUIN. But at this time we are getting it from Chile, or from these coke-oven plants?

Gen. WILLIAMS. Yes; we get nitrate, but in so far as explosives are concerned he would not during peace times, as I understand it, actually manufacture any explosives at all. He would maintain the portion of the plant that is needed to make the explosives.

Mr. QUIN. In other words, he will maintain it for the purpose Congress put it up for?

Gen. WILLIAMS. Yes; but in whatever way he intends to maintain it, it will take time to get the product for explosives because of the fact that the process beyond the point where you make ammonia will not be in operation; there will be no organization, nobody will be trained, so that you will have to get your organization and train them to go ahead and make this particular product.

Mr. QUIN. That is, to turn nitrate into explosives?

Gen. WILLIAMS. No, sir; you do not turn nitrate into explosives.

Mr. QUIN. Mix it with T. N. T.

Gen. WILLIAMS. No; the thing that happens here is that the process for making ammonium sulphate and the process for making ammonium nitrate are the same up to a certain point. Up to that point you would have an organization and machinery and a plant working, but from the point where you get your ammonia on until you produce the ammonium nitrate the plant would not be in operation in peace time.

Mr. QUIN. That would be ready, would it not?

Gen. WILLIAMS. Yes; it would be ready.

Mr. QUIN. That is all the Government could do with it?

Gen. WILLIAMS. That is all the Government would do.

Mr. QUIN. My friend, Brother Miller, seems to have engendered a special hostility against Dam No. 3. If Dam No. 3 is completed, or constructed, any sensible man knows it is going to back the water up into the Tennessee River and other streams. Is that not true?

Gen. WILLIAMS. Yes.

Mr. QUIN. That water will be held in reserve for the dry season of the year to keep a normal supply running at the maximum rate for Dam No. 2?

Gen. WILLIAMS. I do not know about that, the Chief of Engineers can give you that information.

Mr. QUIN. That is a reasonable conclusion to reach, is it not?

Gen. WILLIAMS. I understand the building of Dam No. 3 would not increase the primary power of Dam No. 2.

Mr. QUIN. That is one of the purposes of Dam No. 3, is it not?

Gen. WILLIAMS. No; not as I understand it. But I am not familiar with it.

Mr. QUIN. Furthermore, the construction of Dam No. 3 will make navigable certain waters above there that would not be navigable above that.

Gen. WILLIAMS. Yes, sir.

Mr. QUIN. Then, under Mr. Ford's proposition, you have, out of this estimated scrap value of something over \$8,000,000, a plant which has been estimated by the Secretary of War to be worth \$7,200,000. That is nitrate plant No. 2, and that is the estimated amount it is stated to be worth on page 20 of the Secretary's report to Congress.

Gen. WILLIAMS. Yes, sir; that is right.

Mr. QUIN. Mr. Ford is asking the Government to let him advance \$5,000,000 under that proposition in the periods named, the Government to construct and finish Dam No. 2 and Dam No. 3 at an estimated cost of between \$42,000,000 and \$50,000,000, as I understand it. You do not know what he is going to do, so far as damming up other places there is concerned and making the water supply better, do you?

Gen. WILLIAMS. No.

Mr. QUIN. Mr. Parker seems to think it would cost more to make fertilizer there than it ever did before. Do you not believe that Mr. Ford can make certain by-products as a result of his investment at this place, such as aluminum and other metal products that will make this fertilizer product a mere waste, so far as expense is concerned, at \$8 or \$10 a ton: is that not possible?

Gen. WILLIAMS. No, sir; I have no such idea as that.

Mr. QUIN. I believe they can do it, and the farmers believe it too. Do you not believe that if this proposition is accepted Mr. Ford can take the power from these dams and transmit electric current several hundred miles away from there; that is, in addition to what he needs?

Gen. WILLIAMS. Oh, yes.

Mr. QUIN. Then, that would develop manufacturing enterprises in all the surrounding States within a reasonable distance, would it not?

Gen. WILLIAMS. It would encourage them.

Mr. QUIN. If those manufacturing enterprises can get cheap current with coal at \$10 or \$12 a ton, would that not be a reasonable proposition?

Gen. WILLIAMS. That is an important element of the cost.

Mr. QUIN. Then, the construction of the dam would improve and increase navigation?

Gen. WILLIAMS. Yes.

Mr. QUIN. That would help all the territory both above and below Muscle Shoals?

Gen. WILLIAMS. I should think so.

Mr. QUIN. And commercial activities, agricultural interests, and everything else would be bound to be helped?

Gen. WILLIAMS. Yes.

Mr. QUIN. This man Ford has made a success in everything he has entered, has he not?

Gen. WILLIAMS. Undoubtedly.

Mr. QUIN. It is no chimerical dream with him?

Gen. WILLIAMS. No.

Mr. QUIN. He has one of the best factories in the United States, and now he has succeeded in the railroad business, considering the short time he has been in it, has he not?

Gen. WILLIAMS. That, I should think, would require analysis.

Mr. QUIN. He has succeeded so well in the railroad business that he tried to get the Interstate Commerce Commission to reduce the rates on his railroad, which they refused to allow him to do, and he has reduced the employees on the railroad from 2,700 to 1,600, and raised all of their salaries. Does that not show that he is a man of more than ordinary ability? If he could do that, while the other roads were crying that they had to increase their rates and decrease the salaries of their employees, do you not think there is some chance for Mr. Ford to decrease the price of commercial fertilizer to the agricultural classes of the country by the development of this project?

Gen. WILLIAMS. I see no relation between the one and the other.

Mr. QUIN. I think there is a relation between them, General. Mr. Ford does not propose, as I understand it, to hold this for himself and his estate, as a profit-making proposition, does he?

Gen. WILLIAMS. He stipulates that in the operation of nitrate plant No. 2, he will not make more than 8 per cent profit, but he said to the Secretary of War in an interview with reference to making a profit, that he will not operate it unless he does make a profit, and I take it that he means he must make a profit on the whole enterprise.

Mr. QUIN. As I understand it, this gentleman wants to set an example to the people of the United States as to what can be done.

Gen. WILLIAMS. My understanding is that the operation of nitrate plant No. 2 is not necessarily tied up with the rest of it, according to his statement to the Secretary of War. There would be various elements of the enterprise, and if one part were not successful, he would lop it off.

Mr. QUIN. Mr. Ford proposes that the Government would have this back at the end of 100 years?

Gen. WILLIAMS. It is a lease.

Mr. QUIN. He wants the right of renewal.

Gen. WILLIAMS. It is a lease.

Mr. QUIN. He wants the right of renewal, with his estate operating this after he is gone. He proposes to keep in operating condition and turn over to the Government in time of emergency this plant, the estimated scrap value of which has been put at \$7,200,000. Do you not believe, laying aside all benefit to the people and just considering the benefit to the Government for the purpose of securing nitrates in case of an emergency or in case of war, that it is a good proposition?

Gen. WILLIAMS. It is of value; yes.

Mr. QUIN. You and I both believe we ought to keep the nitrate plant ready.

Gen. WILLIAMS. Yes; I should not recommend that this plant be not retained. If Mr. Ford's offer is not accepted, then our recommendation would be that nitrate plant No. 2, with its steam power plant, be retained.

Mr. QUIN. Then you would either have to maintain it at a cost to the Government or you would have to lease it to somebody else.

Gen. WILLIAMS. We could lease the power plant for a sufficient amount to maintain the rest of it.

Mr. QUIN. There could not be a profit on it?

Gen. WILLIAMS. No, sir; there would be no profit.

Mr. QUIN. Under Mr. Ford's proposition you have the element of navigation, you have the element of industrial development, not only for the immediate territory but you have all the prospective development in the territory surrounding that country for 700 miles. If the proposition stated by my friend, Mr. Miller, is true, would you not cut out navigation and cut out development and have nothing there except the power plant?

Gen. WILLIAMS. No, sir; I do not think that follows, because you have the steam plant there to be operated in connection with the dam.

You could very materially increase your primary power, and then you would have a considerable period during the year when you would have a large excess of power beyond what would be needed for the nitrate plant.

Mr. QUIN. It would not be sufficient to carry out a great program. If you went ahead and built Dam No. 3 you would have water for the very periods of the year when it would be needed.

Gen. WILLIAMS. Dam No. 3 may very materially increase your power.

Mr. QUIN. The Government—and I believe righteously so—has irrigated the land of the farmers in the West, has it not?

Gen. WILLIAMS. Yes.

Mr. QUIN. I believe it has done some of that work in Mr. Miller's State. I believe in that. We turn the water on these arid lands and that fertilizes them. The Government, through its agencies, is turning the water on that land. General, do you not believe the Government owes that same responsibility and duty to other people of the country, to give the farmers fertilizer from this source or some other source, just as the Government turns water on the arid lands?

Gen. WILLIAMS. That is a matter of governmental policy which I think I am not competent to pass on.

Mr. QUIN. Mr. Parker suggested that the coke ovens could supply this ammonium sulphate. How much do they supply now?

Gen. WILLIAMS. The capacity of the by-product coke ovens is about 500,000 tons of ammonium sulphate a year. This plant has a capacity of 200,000 tons.

Mr. QUIN. With this plant operating and producing, say, 200,000 tons, how many tons of fertilizer would that be?

Gen. WILLIAMS. I do not know, sir.

Mr. QUIN. About three or four million tons, would it not?

Gen. WILLIAMS. I could not tell you; I do not know the formula for fertilizer.

Mr. QUIN. This product comes out in a concentrated form, as I understand it.

Gen. WILLIAMS. It comes out as sulphate of ammonia, which is an ingredient of fertilizer.

The CHAIRMAN. But it is not fertilizer?

Gen. WILLIAMS. No, sir; it is not.

Mr. QUIN. It is the basis of fertilizer. You understand, do you not, that certain plants take it out of the atmosphere?

Gen. WILLIAMS. I understand there are three essential elements that go into fertilizer—phosphorus, potassium, and nitrogen.

Mr. QUIN. And this community down there at Muscle Shoals has all three of them? Phosphorus is there in great quantities, is it not?

Gen. WILLIAMS. There is phosphorus rock in Tennessee.

Mr. QUIN. And limestone is in the quarries there.

Gen. WILLIAMS. Yes.

(Thereupon the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

STATEMENT OF MAJ. GEN. C. C. WILLIAMS, CHIEF OF ORDNANCE— Resumed.

Mr. QUIN. General, did you find out during the recess the cost of construction of that part of the plant that the Alabama Power Co. put up. You said you did not know whether it was 10 or 6 per cent, but you thought it was 6 per cent.

Gen. WILLIAMS. Six per cent, sir.

Mr. QUIN. Could you figure out in dollars and cents how much it was then that the Alabama Power Co. received from the Government for its work in that construction?

Gen. WILLIAMS. The contract provides that "the total of said fee shall not exceed \$225,000." I think that was all paid.

Mr. QUIN. Then the Alabama Power Co. received from the Government \$225,000 for its services in that construction work.

Gen. WILLIAMS. Yes, sir.

Mr. QUIN. Under the contract of the Ordnance Department or the Government with the Alabama Power Co. you stated they were not in position and did not furnish during the war under that contract any power because of the fact that the war closed as early as it did; is that true, or did I misunderstand you?

Gen. WILLIAMS. Very little power, if any, was furnished, for the nitrate plant itself was not ready to take power until just shortly before the armistice. The Alabama Power Co. had obligated themselves to put their whole system back of this plant and furnish us with, I think, 30,000 kilowatts. It does not necessarily follow that we got power from this particular establishment.

Mr. QUIN. In that construction, wherein four million and some odd dollars was expended, the Government put up the money and not the Alabama Power Co.

Gen. WILLIAMS. The Government put up the money; yes, sir.

Mr. QUIN. And they then received the sum of \$225,000 for such work as their fees and profits. On the question you were discussing about the moral obligation on the part of the Government to these people touching that contract, do you not think that the Government owes a moral obligation to the taxpayers that put up that money and are continuing to put it up?

Gen. WILLIAMS. My point of view, Mr. Quin, is that the Government, through its accredited agents, entered in good faith into a contract with the Alabama Power Co., and, so far as it knew, in accordance with the law; and I think the Government, when it entered into that contract, assumed an obligation to carry it out.

Mr. QUIN. And you do not think the \$225,000 that they received would be a sufficient compensation and warrant that contract to be nullified without additional compensation now?

Gen. WILLIAMS. Inasmuch as the \$225,000 was itself a part of the contract, I can not see that it has any relation whatever to the obligation which the Government undertook.

Mr. QUIN. In the estimate for scrapping this entire outfit at Muscle Shoals for \$8,812,000, do you base that on the same type of estimate that the other plants were salvaged?

Gen. WILLIAMS. Yes, sir; we arrive at that figure through our experience with other plants.

Mr. QUIN. Well, take Hog Island. We lost a great sum of money there; was it based on that work?

Gen. WILLIAMS. No, sir; I had nothing to do with that.

Mr. QUIN. That was not under the Ordnance Department?

Gen. WILLIAMS. No, sir.

Mr. QUIN. This West Virginia plant was under the Ordnance Department.

Gen. WILLIAMS. At Nitro?

Mr. QUIN. Yes; how about that?

Gen. WILLIAMS. Our experience there was taken into consideration and our experience at Old Hickory and various other places where we have salvaged large plants.

Mr. QUIN. We lost a great deal of money on the West Virginia business, did we not? About \$100,000,000 was put into that?

Gen. WILLIAMS. No, sir; we put in there about \$60,000,000, as I remember the figures, and we expect to get out of it anywhere from eight to eleven million dollars.

Mr. QUIN. How much did you have in the Tennessee plant, the Old Hickory plant, I believe they call it.

Gen. WILLIAMS. We put in there about \$80,000,000 and we are getting out of that about \$3,500,000.

Mr. QUIN. \$3,500,000 out of \$80,000,000, about what per cent is that?

Gen. WILLIAMS. That would be about 4½ per cent.

Mr. QUIN. To scrap the outfit at Muscle Shoals for the sum named would mean the dismantlement and abandonment of the whole business there.

Gen. WILLIAMS. Yes, the whole thing. That is what we mean by scrapping.

Mr. QUIN. And the bats would fly over there and nest there instead of having smokestacks and having 1,000,000 men at work there.

Gen. WILLIAMS. There would be nothing left there for the bats to fly over or to nest in.

Mr. QUIN. They would have to make their nests on the bare ground, whereas Mr. Ford stated when he had his enterprise completed it would employ 1,000,000 men. If that be true, and he pays about \$5 a day, that would be about \$5,000,000 a day in pay rolls down in that community, would it not, General?

Gen. WILLIAMS. Yes, sir.

The CHAIRMAN. Of course, that is not officially before us, Mr. Quin.

Mr. QUIN. No, sir; but that is the statement he made. I have no means of knowing whether it is true or not.

The CHAIRMAN. Of course, Mr. Ford's representatives will be before the committee on Monday and undoubtedly will state just what is intended.

Mr. QUIN. We know he is going to employ some labor down there. He is bound to do that.

Gen. WILLIAMS. Yes, sir.

Mr. QUIN. And it is bound to be a good thing for that territory, especially.

Gen. WILLIAMS. Yes, sir.

Mr. QUIN. Under his offer \$5,000,000 will be received by the Government for the property and the Government will have nitrate plant and power plant No. 2 at its disposal, as you stated this morning, in case of war, or threatened war, on the basis of 8 per cent profit to Mr. Ford.

Gen. WILLIAMS. The 8 per cent profit, as I understand it, is what he limits himself to in the case of producing fertilizer.

Mr. QUIN. That was my understanding, but I asked the question this morning about turning it over to the Government to operate—

Gen. WILLIAMS (interposing). I do not understand that the 8 per cent applies to that. The nitrate plant No. 2 will be Mr. Ford's property, and when that is taken over by the Government in case of a crisis, undoubtedly, there will be negotiations between the Ford Co. and the United States as to the terms under which it will be taken over.

Mr. QUIN. Then, General, you do not mean to state, as I understand it, that he would get 8 per cent out of the Government during a war.

Gen. WILLIAMS. No, sir.

Mr. QUIN. Or in case of an emergency when it was turned over.

Gen. WILLIAMS. No, sir.

Mr. QUIN. And if he did get that it would be a heap more reasonable than what we got from other concerns during our last experience from 1917 to 1919.

Gen. WILLIAMS. I do not think that necessarily follows.

Mr. QUIN. It may not necessarily follow, but then you know something about what it cost your department and you know what other departments had to pay for a great many things where the Government was hogged. You could not help it and we could not help it, but it was hogged at Hog Island, and at a great many other places, and by these airplane concerns in Ohio and elsewhere. Now, the record will show your answer to be that under his proposition, if accepted by the Congress and the Government, plant No. 2 and the power plant at No. 2 will be under the control of the Government through the War Department at whatever terms the Government sees proper to make, or they can take it for nothing if they want to.

Gen. WILLIAMS. No, sir; they could not take it for nothing.

Mr. QUIN. Well, we conscripted men, and I believe if we are going to conscript men we should go out and conscript everything we need in case of war.

The CHAIRMAN. The gentleman did not believe in conscripting men for the war.

Mr. QUIN. No, I did not believe in it until they put it up to me that they could not get them in any other way and then I was for conscription, and I do not think we ought to conscript them without conscripting such enterprises as this, if the Government needs them. That is my honest judgment about it. Gen. Williams, \$7,250,000 is the estimated value of nitrate plant No. 2 and the power plant for scrapping. How much more is the total amount of all of the business at Muscle Shoals for scrapping?

Gen. WILLIAMS. \$1,562,000.

Mr. QUIN. Then Mr. Ford or his company will be giving you—and by you I mean the Government—all of the estimated value except \$1,220,000, and the Government will have for its own use the main thing it needs for war, namely, nitrate plant No. 2.

Gen. WILLIAMS. No, sir; because I should have no idea that the Ford company would scrap these properties. They would dispose of them as going concerns if they got control of them, I take it.

Mr. QUIN. You misunderstood me. I think that is what they want to do with them, but I said that for scrap purposes—I am trying to get the difference between what we would be out.

Gen. WILLIAMS. Then I think you must take it on the basis I suggested, that they would make the best disposition of those properties they could, and the best disposition, as we indicate by these figures, is not to scrap them.

Mr. QUIN. You do not know whether they would be scrapped or not.

Gen. WILLIAMS. I can not imagine they would scrap them.

Mr. QUIN. You do not know that?

Gen. WILLIAMS. Because that would not be the way they would get the best return.

Mr. QUIN. In the analysis presented by the Secretary of War, the question of lease for 100 years came up.

Gen. WILLIAMS. Yes, sir.

Mr. QUIN. And he is against it and believes in a 50-year lease. Have you a judgment on that proposition, General?

Gen. WILLIAMS. No, sir; I have no particular thoughts on the matter that I think would be of value.

Mr. QUIN. It would be immaterial to you which was adopted, and you would not object to a 100-year lease if we decided in favor of the Ford proposition?

Gen. WILLIAMS. No; we would raise no objection, particularly.

Mr. QUIN. What you want is that nitrate plant to be kept there ready for an emergency.

Gen. WILLIAMS. That is our prime concern in so far as the Ordnance Department is concerned, because it has to do with preparation for furnishing the materials of war.

Mr. FISHER. General, a good deal has been said about the options that were given to the two big corporations that did work for the Government in that section. You are very familiar with those options, are you not; that is, as to the phraseology of the contracts reserving the options?

Gen. WILLIAMS. I am not sufficiently familiar to discuss them in detail.

Mr. FISHER. From what you know of them, do you consider that the Government, as it stands now, without an expression from those companies, is in a position to accept the Ford offer; that is, in the absence of a declaration from those two companies, is the Government in a position to accept the Ford offer?

Gen. WILLIAMS. It seems to me that as parties at interest, their side of it should certainly be heard and considered.

Mr. FISHER. Have you had any communication with the representatives of either of those corporations to determine their attitude about the exercise of the options; that is, whether they expect to exercise that right or not?

Gen. WILLIAMS. I think the Secretary of War testified that the Air Nitrates Corporation said they would desire to exercise their option, and also that he expected the Alabama Power Co. would desire to do the same thing.

The CHAIRMAN. Mr. Fisher, I would say to you that both companies have written the chairman of the committee asking to be heard on the proposition.

Mr. FISHER. On the question of section 16 of the Ford contract, I would like to ask you whether or not you consider that if the contract is carried out, that the provisions as indicated in section 16 would give the United States Government what you would consider as preparedness in the way of nitrates for munitions in case of an emergency?

Gen. WILLIAMS. It would very materially contribute to preparedness for nitrates in so far as munitions are concerned.

Mr. FISHER. Has the Ordnance Department or the War Department a laboratory with officers or representatives studying these chemical problems and making experiments such as would be offered to the Government under section 16?

Gen. WILLIAMS. During the war we started a chemical research laboratory along these lines at the American University, just out of Washington. That was maintained by the Ordnance Department until last July, when we turned it over to the Agricultural Department. That laboratory is in operation now.

Mr. FISHER. What would you consider the approximate cash value to the Ordnance Department of a plant that is functioning with skilled personnel, as is indicated in section 16?

Gen. WILLIAMS. The nearest answer I can give to that would be the cost to install this plant, because Mr. Ford's offer provides for the maintenance of that plant at approximately its capacity output. Now, then, under war conditions, I can see no reason to suppose that we are going to do things very much cheaper, relatively, in any crisis to come, in the course of the next 25 or 30 years than we did in this crisis, and, therefore, I should say that the cost of this plant would represent practically the cash value.

Mr. FISHER. If the Ford offer is not accepted, is it the plan of the Ordnance Department to keep No. 2 in a stand-by condition?

Gen. WILLIAMS. It is; we recommend it.

Mr. FISHER. Is a plant in a stand-by condition, such as you propose to keep plant No. 2, comparable as a ready plant for the production of nitrate with one that is a going concern as indicated by section 16?

Gen. WILLIAMS. No; it is not.

Mr. FISHER. I would like to know whether or not the Ordnance Department, in the failure of the acceptance of the Ford offer, has a plan for nitrate preparedness.

Gen. WILLIAMS. Our plan is simply the retention of this plant in a stand-by condition ready to be put in operation as soon as an organization can be gotten together and started going. We estimate it will take about three months to start production and five months before we would be producing to capacity.

Mr. FISHER. Whereas, if the Ford offer was accepted, it is ready within five days.

Gen. WILLIAMS. No; not within five days, I should say, because under the Ford offer only a portion of the process would be carried on normally, and the remainder would have to be put into operation, and that of necessity would take time.

Mr. WRIGHT. General, you think it would be contrary to sound military policy to abandon nitrate plant No. 2?

Gen. WILLIAMS. I think it would be contrary to a sound military policy; yes, sir.

Mr. WRIGHT. And would you not further recommend if the Ford proposition is not accepted, that the Government complete Dam No. 2 to be used in conjunction with nitrate plant No. 2?

Gen. WILLIAMS. That does not come within my province at all. The Secretary of War has stated he would recommend it and has so stated in the record.

Mr. WRIGHT. Do you not think that cheaper power is essential there than steam power?

Gen. WILLIAMS. That would cheapen the product.

Mr. WRIGHT. And as I understand you, the fertilizer feature of this project is one attended with great possibilities.

Gen. WILLIAMS. Well, I do not see the very great possibilities of it so far as cheapness of production is concerned. The thing to my mind that offers the greatest possibilities would be the research laboratory that Mr. Ford says he is going to put in operation down there. With the fixation of nitrogen in the stage of development in which it is now, I do not think anybody can say what process is going to be the process that will be used 20 years from now.

Mr. WRIGHT. That is largely what I meant by great possibilities.

Gen. WILLIAMS. Yes; there are great possibilities in the question of the fixation of nitrogen.

Mr. WRIGHT. And in the development of this industry?

Gen. WILLIAMS. Yes, sir; I think so.

Mr. STOLL. General, who first acquired the Warrior plant at Gorgas, the Alabama Power Co. or the Government?

Gen. WILLIAMS. The property, the land on which the plant is built there, was at the beginning of the war, and is now, the property of the Alabama Power Co.

Mr. STOLL. The Government did own it for awhile?

Gen. WILLIAMS. The Government has never owned it.

Mr. STOLL. The Government has never owned the land?

Gen. WILLIAMS. No, sir.

Mr. STOLL. I believe you have stated that that plant is about 88 miles from nitrate plant No. 2.

Gen. WILLIAMS. Yes, sir.

Mr. STOLL. What is the nearest point at Muscle Shoals to this Warrior steam plant?

Gen. WILLIAMS. Muscle Shoals is about 2 miles from the Muscle Shoals No. 2 Dam.

Mr. STOLL. Then, how did this Warrior steam plant at Gorgas get connected up with the Muscle Shoals project if it is 88 miles away from it?

Gen. WILLIAMS. By building a transmission line.

Mr. STOLL. For what purpose?

Gen. WILLIAMS. For the purpose of transmitting power from the Alabama Power Co. to nitrate plant No. 2.

Mr. STOLL. For the manufacture of nitrates?

Gen. WILLIAMS. Yes, sir.

Mr. STOLL. Did you not have a steam plant there to generate the electricity?

Gen. WILLIAMS. We had one in process of construction which was not completed until after the war was over.

Mr. STOLL. The Alabama Power Co. is furnishing electricity to various portions of that country?

Gen. WILLIAMS. Yes, sir.

Mr. STOLL. And in November of last year the Alabama Power Co. leased the steam plant at plant No. 2, did they not?

Gen. WILLIAMS. Yes, sir; in November of last year.

Mr. STOLL. Did they ever use it?

Gen. WILLIAMS. I do not think they have put it into operation. My information is that they put a gang of men in there to put it in operation, but at about the time they were ready, the rains came and increased their water power to the point where it was not necessary for them to throw in that plant.

Mr. STOLL. Nitrate plant No. 2 produces, I believe you stated, 110,000 tons annually?

Gen. WILLIAMS. Of ammonium nitrate; yes, sir.

Mr. STOLL. That will make how much sulphate of ammonia?

Gen. WILLIAMS. About 215,000 tons, I am informed.

Mr. STOLL. You sold some of your nitrates there, did you not?

Gen. WILLIAMS. We produced only a very small amount and I do not think we have yet sold any. We made about 1,700 tons of the ammonium nitrate, and in addition to that about 2,000 tons of cyanamid.

Mr. STOLL. Did you have any Chilean nitrate there?

Gen. WILLIAMS. No, sir.

Mr. STOLL. What are the different parts of commercial fertilizer besides the sodium phosphate?

Gen. WILLIAMS. I know very little about fertilizers, Mr. Stoll. As I understand it, the ammonium sulphate is simply one of the ingredients that carry the nitrogen.

Mr. STOLL. Is not that about the hardest one to get?

Gen. WILLIAMS. For the fixed nitrogen we are dependent now on the sodium nitrate that comes from Chile; that is the largest source of supply in the world. There is also the ammonia recovered at the by-product coke ovens and the gas works.

Mr. STOLL. And that is the hardest ingredient the fertilizer people have to get, is it not?

Gen. WILLIAMS. I think so, sir, although I am not positive about that.

Mr. STOLL. If we had a supply in this country, that would tend to solve the fertilizer problem?

Gen. WILLIAMS. Yes, sir.

Mr. STOLL. As I understand it, only about 3 per cent of sodium phosphate is used in fertilizer, and there is a little over 7,000,000 tons of fertilizer used in the United States; would not that 200,000 tons go a long ways toward supplying the sodium phosphate when there is only 3 per cent used?

Gen. WILLIAMS. I think that 3 per cent which you refer to is the nitrogen content.

Mr. STOLL. How is that?

Gen. WILLIAMS. That 3 per cent is the nitrogen content and the percentage of weight of the ammonium sulphate fertilizer itself would be very considerably more than that.

Mr. STOLL. I thought the common brand of fertilizer was 8, 3, and 3.

Gen. WILLIAMS. Yes, sir.

Mr. STOLL. There are 2,000 pounds in a ton of fertilizer and the great part of the 2,000 pounds is bulk that is simply used to distribute the ingredients put into it, and as I understand it, there is only 3 per cent of the fertilizer that is sodium phosphate.

Gen. WILLIAMS. My understanding of the meaning of that formula is this: You have three elements that are essential to plant life. You have the phosphorus, nitrogen, and potassium. Now, the formula of 8, 3, and 3 refers to the percentage by weight of those three elements in the total weight of the fertilizer.

Mr. STOLL. I will put it in this way: You do not know how many pounds of ammonia there would be in a ton of commercial fertilizer?

Gen. WILLIAMS. Of ammonium sulphate, no, sir, I do not. That could be figured back very easily. The figures I have here indicate that for the average nitrogen containing fertilizer sold in 1919 there were 56.7 pounds of ammonium sulphate per 2,000 pounds of fertilizer.

Mr. STOLL. How many pounds?

Gen. WILLIAMS. 56.7 pounds.

Mr. STOLL. In a ton?

Gen. WILLIAMS. In a ton.

Mr. STOLL. If there are 200,000 tons that would make about how many ton of fertilizer? Would not that be around 8,000,000 tons?

Gen. WILLIAMS. I am inclined to think there must be something wrong about that figure.

Mr. STOLL. Of course, I do not know. They are the figures you give. There are about 7,000,000 tons of commercial fertilizer used and if we get enough of the ammonia there to make 8,000,000 tons, we are doing the farmers a considerable service, do you not think?

Gen. WILLIAMS. Assuming those figures are correct and you can produce the ammonium sulphate at less than the present market prices. Mr. Chairman, I would like to have a chance to look into this matter of the formulas and the amount of various ingredients further and correct my statement in the record accordingly.

The CHAIRMAN. If there is no objection, that may be done.

(The statement referred to follows:)

"Ammonium sulphate furnishes only a part of the nitrogen in commercial fertilizers. Among other nitrogenous materials are nitrate of soda, cyanamid, slaughterhouse tankage, and cottonseed meal. In 1919, according to the census figures, the average mixed fertilizer contained 45.7 pounds of nitrogen. The 56.7 pounds of ammonium sulphate furnished 11.7 pounds of the nitrogen. Nitrate of soda furnished 8.4 pounds of nitrogen, and cyanamid 1.3 pounds. These chemical or inorganic materials furnished thus a total of 21.4 pounds of nitrogen. The other 24.3 pounds was furnished by the organic materials, such as cotton seed meal, and slaughter house tankage.

"If all of the 21.4 pounds of 'inorganic' nitrogen had been furnished by sulphate of ammonia, there would have been 104 pounds of sulphate used per ton of fertilizer. On this basis 215,000 tons of sulphate would furnish enough nitrogen for some 4,000,000 tons of fertilizer.

"If the entire 45.7 pounds of nitrogen had been furnished by sulphate, it would have required 222 pounds of sulphate per ton of fertilizer. On this basis 215,000 tons of sulphate would furnish all the nitrate for nearly 2,000,000 tons of fertilizer."

Mr. STOLL. Mr. Chairman, I have here a table furnished me by the Department of Agriculture that gives the amount of fertilizers used by the various States, and I would like to put it in the record at the proper place.

The CHAIRMAN. If there is no objection, that may be done.

FERTILIZER TONNAGE BY STATES.

Following is the list of States, showing the consumption of fertilizers for the fiscal years ending in 1913, 1914, 1915, 1916, 1917, 1918, 1919, and 1920, compiled from the most reliable statistics that are obtainable. In some of the States there are absolutely no accurate figures available.

¹ Estimated.

Mr. PARKER. General, I asked you about the cost of manufacture, and I would like for you to put in your detailed statement the cost by water power and steam, so that I can see how much you allow per horse power. I do not suppose you allow much per horse power for the water power.

Gen. WILLIAMS. I will give you a detailed statement of that for the record.

Mr. PARKER. I wanted to see whether you allowed any cost for the water power.

Gen. WILLIAMS. Yes, sir; that is taken into consideration. That is shown in the cost per ton as we estimate it.

Mr. PARKER. Then I will wait until I get your detailed statement.

Detailed estimate of cost of sulphate of ammonia and nitrate of ammonia at United States nitrate plant No. 2, Muscle Shoals, Ala.

SULPHATE OF AMMONIA.

	Quantity per ton.	Unit cost.	Cost per ton.	
			Using steam power.	Using water power.
Limestone.....	1.81 tons.....	\$1.25	\$2.28	\$2.26
Coke.....	0.56 ton.....	6.00	3.36	3.36

Cost, without royalties.....			88.11	68.41
Allowance for royalties at 10 per cent, assuming reduction by arbitration.....			8.81	6.84
Cost, f. o. b. cars, Muscle Shoals, Ala.....			96.92	75.25

NOTES.

A more detailed analysis of certain of the above items will be found in "Hearing before the Committee on Military Affairs, House of Representatives, Sixty-sixth Congress, second session, on H. R. 10329 and S. 3380," 1920.

In the production cost estimates the quantity of raw materials and power used in the manufacture of the several products are based on the actual results of the two weeks' operating test of the plant at one-fifth capacity in January, 1919. The quantity of materials used in the several manufacturing processes were carefully measured and weighed daily and the consumption for the entire period of the test thus determined and the products manufactured carefully determined.

The unit prices of materials are those which existed at the time the estimate was made, in the summer of 1919, and it is believed will prevail as conditions become more stabilized.

Expense for royalties and fees has been figured in accordance with the provisions of the present contracts with the American Cyanamid Co. and its subsidiary, the Air Nitrates Corporation, and with the Air Reduction Co., due consideration being given to arbitration clauses in estimates of cost after June 1, 1921.

These estimates do not include any allowance for interest on capital cost, depreciation, and obsolescence, or taxes and insurance. These estimates are also based upon the assumption that all community arrangements will be self-supporting in so far as current operating expenses are concerned.

The CHAIRMAN. General, do you consider the production of nitrates essential to this country for military purposes?

Gen. WILLIAMS. Undoubtedly; yes, sir.

The CHAIRMAN. And in the building up of Muscle Shoals, your department has taken a very great interest, I assume.

Gen. WILLIAMS. Our department has built all of the establishments that are there now, everything except the dams.

The CHAIRMAN. And it was for the primary purpose of supplying material in case we got into war.

Gen. WILLIAMS. That was the primary purpose of it.

The CHAIRMAN. And all the money that is invested in the plant at Muscle Shoals, I take it, was taken from the appropriations for military purposes?

Gen. WILLIAMS. Armament of fortifications, yes, sir, that is, for nitrate plant No. 2. I think the land on which plant No. 1 is located was paid for out of the \$20,000,000 appropriated in 1916.

The CHAIRMAN. And that was the national defense bill, which was a military bill?

Gen. WILLIAMS. Yes, sir.

Mr. QUIN. I would like to ask for the record one question more, and that is, how long was the period of time that the Alabama Power Co. was engaged in constructing the work there for which they received the \$4,000,000 plus, or for which that amount was paid?

Gen. WILLIAMS. Approximately one year.

Mr. HULL. General, I do not know but what this question has been answered, or it may be that you can not answer it offhand; but I think, for the record, it should be stated, and that is, provided we accept Mr. Ford's offer or some proposition of that kind, how long would it take to change that plant from a fertilizer plant into a plant for the manufacture of nitrates for high explosives? There has been some question along that line, but I did not hear any definite answer, and I would like to have the record show that.

Gen. WILLIAMS. I think Mr. Ford in his proposition proposes to maintain the plant ready to produce the explosive. The time it would take would be the time it would take to divert the process from producing ammonium sulphate to producing ammonium nitrate, and that should be a comparatively short time; just what length of time I could not state.

Mr. HULL. I think we should have something from the experts to show about how long.

Gen. WILLIAMS. About three months, I should say.

Mr. HULL. As long as that?

Gen. WILLIAMS. Before it would be producing to full capacity.

STATEMENT OF MAJ. GEN. LANSING H. BEACH, CHIEF OF ENGINEERS, ACCOMPANIED BY BRIG. GEN. HARRY TAYLOR, ASSISTANT.

The CHAIRMAN. Gen. Beach, we are considering, as you know, the proposal of Mr. Ford with reference to the Muscle Shoals proposition. I understand that the Engineers have had considerable to do with the building of that plant. Will you kindly state in your own way just what you know about the proposition and what interest the Engineers have in the matter.

Gen. BEACH. The construction or building of Dam No. 2 was intrusted to the Engineer Department, which has charge of river and harbor works throughout the country. This dam was started as a means of reducing the cost of operating the nitrate plants, which had been installed at that locality by another branch of the Government.

The funds which were allotted were from the appropriation for fortification and armament, an appropriation with which the Engineer Department of the Army ordinarily has nothing to do except to build fortifications, and the allotment not having been sufficient to complete the dam, a year ago when we were nearing the end of the funds in hand, we had to ask for an additional appropriation from Congress. That was refused at the last session of the last Congress, and after the present administration took charge of governmental affairs I was directed by the Secretary of War to ascertain whether the completion of this dam and power plant was a practical arrangement or not and to ascertain what I could in regard to that feature of the case and report to him.

I wrote to all the power companies and different parties throughout the country that I thought might be interested in the matter. Mr. Ford's proposition was the only one which was received up to the time it was presented, and I forwarded it to the Secretary of War, as evidence of the fact that the completion of this dam was a practicable

undertaking; and he has had charge of the negotiations with regard to Mr. Ford and other parties since that date.

The CHAIRMAN. The Secretary himself has had direct communication with Mr. Ford respecting the turning over of the plant rather than the Chief of Engineers?

Gen. BEACH. Yes, sir. After I forwarded Mr. Ford's proposition to the Secretary of War, he has handled those matters directly. He has had, I believe, four interviews with Mr. Ford or his representatives, at only one of which I was present, because it happened that on the first two occasions I was out of town, and on the last occasion I was not notified, or my office was not notified, until Mr. Ford was in the office, and at that time I was tied up in a conference with officers of the General Staff.

The CHAIRMAN. Is there any special statement that you desire to make to the committee respecting Mr. Ford's offer? As I understand it, the first offer made on July 8, 1921, was made to you and not to the Secretary?

Gen. BEACH. Yes, sir; it was made to me in response to that inquiry which I sent out to all the parties, as I have mentioned.

The CHAIRMAN. About how many letters did you write, or about how many parties did you communicate with?

Gen. BEACH. Probably 10 or 12.

The CHAIRMAN. And the only answer you got was from Mr. Ford?

Gen. BEACH. The only proposition which I received.

The CHAIRMAN. The only proposition, yes.

Gen. BEACH. I sent out this letter:

"The Secretary of War has directed me to ascertain what arrangements can be made to derive a reasonable return upon the investment if the United States completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River.

"If you are interested, I would be pleased to discuss the matter with you at this office at the earliest date that may be mutually determined.

"It is desired to develop the matter and come to a conclusion at as early a date as possible."

That is practically the same letter that the Secretary was requested yesterday to put on file.

The CHAIRMAN. In response to that letter the only offer was the one received from Mr. Ford.

Gen. BEACH. The only, what I would call, genuine offer. I gave as wide publicity to that letter as was possible. A good many papers printed it. I furnished it to the press. I did receive some responses which from their tone and the character of writing were evidently from irresponsible parties.

The CHAIRMAN. Would you mind stating to the committee just what some of those answers were?

Gen. BEACH. One, I remember, was to the effect that the man would be pleased to undertake that if the Government would pay him \$1,000,000. Another one was from a man who said that he was accustomed to forming large companies and undertaking matters of great import, and if he could be allowed \$40,000 as expense money, he thought he could put it over, and there were others to that effect. I paid no attention to them beyond filing them, for the reason that I felt if the parties were genuinely interested in the matter, they would follow it up and none of them did.

The CHAIRMAN. You heard nothing after the first letter?

Gen. BEACH. I heard nothing from any one of those parties after the first letter. The power companies in the South to whom I wrote replied. The Alabama Power Co. replied under date of May 28. The gist of their letter is really in the final paragraph:

"If, therefore, authority is conferred by Congress to conclude a contract for the use of any part of the power by power companies, we wish to assure you we are ready to work out a mutually satisfactory arrangement looking to the completion of the dam and the disposal of such part of the power as Congress wishes to place in commercial use, desiring now as at all times in the past, to cooperate in every way desired by the United States in working out the matter."

I had several interviews with the officers of the Alabama Power Co. and they stated that they had always been interested in this proposition. It was a very large and important power development in their territory, and I have understood that they would have been very glad to establish this dam if it had not been beyond their financial resources. They pointed out that they were naturally most interested because any invasion of their field with as large a power plant as this would mean a great deal to them in their business relations with their clients or customers, and they said they did not see their way clear to make a proposition because I was not in a position to state when the power would be available, and the terms on which they could obtain it. I requested them, as I did all the others with whom I had conferences, to make their

own proposition. I was asked by several of them to draw up specifications, but I said that the matter was so large and so complex that I was very much afraid that I drew up any set of specifications it might hamper the development in some respects rather than facilitate the development of the whole, and they were all invited to come in and make their own propositions to start with, so that we could then work out something definite after their proposition was received.

I found that I was very badly handicapped, as the Secretary found later, by the fact that we could not give these people any definite assurance. We could not come to any contract or definite agreement with them, and that I think may have possibly prevented some definite offers, but Mr. Ford was the only one that came in with a definite response.

To save time I will just file this reply of the Alabama Power Co. and place it in the record if you care to, or it can be read.

The CHAIRMAN. Is that the same letter that the Secretary put in the record yesterday?

Gen. BEACH. Yes, sir; he was requested yesterday to furnish it.

The CHAIRMAN. Then it would simply be a duplication, as that letter is already in the record.

Gen. BEACH. Yes. (See p. 790.)

The CHAIRMAN. The Alabama Power Co. was organized when? Do you know?

Gen. BEACH. No; I do not know the date of organization, but I do know that along in 1912 and 1913 it made a proposition to the United States in regard to taking over of the power at this locality, which was the subject of examination and report by the Board of Engineers for Rivers and Harbors, and it was then recommended that the offer of the Alabama Power Co. be accepted.

The CHAIRMAN. That was before the World War in Europe started?

Gen. BEACH. That was in 1912 and 1913.

The CHAIRMAN. So that the company had had some existence before they began to get in closer relationship with our Government?

Gen. BEACH. Yes, sir.

The CHAIRMAN. I assumed from some of the questions that were asked this morning that perhaps this company was gotten up during the war particularly for the purpose of getting these contracts with the Government.

Gen. BEACH. No, sir; there was nothing of the kind in that respect. The company was a well-organized and going concern in northern Alabama at the time of the outbreak of the war. It had built its large dam, known as Dam No. 12, at the Coosa River before the war and was engaged in the distribution of power from that dam.

The CHAIRMAN. What did they offer to do? What offer did they make?

Gen. BEACH. In 1913?

The CHAIRMAN. Yes.

Gen. BEACH. I would have to get the record in that case. I do not have the reports here. It is all reported and published, and I am sorry I do not have a copy of that report with me, but I will obtain it.

The CHAIRMAN. What was the sense of the offer that they made? Were they to do the building or was the Government to do it?

Gen. BEACH. To the best of my recollection the Government was to do the building and lease the plant to them at a rate which would amortize the investment and pay a reasonable return to the United States for the use of the money. There was considerable discussion as to whether the term should be 50 years or 100 years, and it was finally decided that in the state of water-power development and the market, that the company would be badly handicapped by a shorter term, and 100 years was recommended.

The CHAIRMAN. Was the general water power act in effect at that time? When did you say this was?

Gen. BEACH. In 1912 and 1913.

The CHAIRMAN. Then, of course, there was no limit on the period of time as there is now?

Gen. BEACH. No, sir.

The CHAIRMAN. Is there anything further you would like to state with reference to the matter?

Gen. BEACH. There is only one thing and that is on the question of the limitation of time. It seems to me that it is not always advisable to apply one general rule. You do not always treat the large bodies the same as the small ones, because the conditions which are necessary to be imposed on a large body would unduly restrict a small organization in the transaction of business, and it is just a question of whether in a big and important a matter as this the 50-year rule would not work a hardship. The Secretary yesterday recommended the application of the 50-year rule on the ground that he did not desire to make an exception. At the same time it seems to me that

there are some other features which come into this case. For instance, this is not as yet a thickly settled portion of the country. It is not given over to manufactures, and it is a very different matter from what the installation of a power plant at Niagara Falls would be. There they have a large city, Buffalo, and cities all along the Great Lakes, Rochester and other large places contiguous, and it is a manufacturing section. Northern Alabama and Tennessee adjacent to Muscle Shoals are not manufacturing sections, and the length of time it would take to find a market for the power which can be developed there might be a very serious matter in the whole case, and it seems to me that the matter should receive careful consideration.

The CHAIRMAN. Then there is the matter of labor that would be required at the plant.

Gen. BEACH. Yes; and in many cases the power is used for operating municipal utilities. Birmingham and Memphis are the only two places anywhere near here. Nashville might be considered, but they are quite a long distance away, comparatively, and the marketing of the power and the development, if it is going to be done along ordinary commercial lines, would be, I think, slower here than at other places where no large water-power projects have been developed. I think it has taken at least 20 years to utilize all the water-power, amounting to about 750,000 horsepower, that has been developed at Niagara Falls, in spite of its greater advantage of location.

The CHAIRMAN. How long a distance has it been proven positively that electric power can be carried?

Gen. BEACH. The Alabama Power Co., I know, are sending power at a voltage of about 110,000 volts to a distance of 250 miles.

The CHAIRMAN. Two hundred and fifty miles?

Gen. BEACH. Yes. There have been claims made by people engaged in electrical transmission of power that they are perfecting that work so that they can transmit power as economically, or will be able soon to transmit power, to a distance of 400 miles as economically as they do at present to a distance of 200 miles.

The CHAIRMAN. I think that it is claimed by the engineers of the water-power companies in California that they can transmit power 400 miles.

Gen. BEACH. But there is another feature of the case which has been developed as a result of the power survey during the war, which makes a great difference in that matter, and that was referred to yesterday in the Secretary of War's testimony when he spoke about relaying the power. I do not know whether the committee exactly understood it, but it might be put in this way. There might be a demand in New York greater than the power plants there could supply, using these cities as an illustration, Philadelphia could not supply any, neither could Baltimore, but Washington could. Now, then, they all say all along the line, if you will send forty or fifty thousand horsepower to Baltimore, Baltimore can send forty or fifty thousand horsepower on to Philadelphia, and Philadelphia can turn that much loose for New York, and by that means of tying together they are now sending power 600 miles.

The CHAIRMAN. Do you call that relaying power? Is that the technical term used?

Gen. BEACH. Yes, sir; that is one term that is used. As I say, they are actually sending the power in that way through different stations to a distance of 600 miles.

Mr. KEARNS. General, I do not understand that that is relaying power. Washington would send its power to Baltimore and Baltimore would use the Washington power and then Baltimore would send power to Philadelphia, and Philadelphia would use the Baltimore power and not the Washington power.

Gen. BEACH. Yes; they would use the Baltimore power.

Mr. KEARNS. And then Philadelphia would send power on to New York and New York would use the Philadelphia power.

Gen. BEACH. Yes.

Mr. KEARNS. That would not be relaying the power.

Gen. BEACH. That is the term I have heard used. Mr. Martin is here and could tell about that. What term do you generally use?

Mr. MARTIN. That is the usual expression that we use in the business.

Gen. BEACH. Mr. Martin, who is the president of the Alabama Power Co., says that that is the term they generally use.

The CHAIRMAN. You may proceed, General.

Gen. BEACH. I was just going to say that those developments in transmission might provide a market at Muscle Shoals much earlier than would have been provided by the former method of simply supplying everything from the station where the power was actually generated, and it might be possible that the period of developing a market for the power at Muscle Shoals would for that very reason be shorter than would be the case under the former method; but there is not much in the immediate vicinity of Muscle Shoals to absorb this power. Things will have to be brought there; either

some establishments created in order to utilize the power or you will have to send it out to other fields if you are going to utilize it at any time within the reasonable future after the completion of the dam.

The CHAIRMAN. You mentioned several cities that are along the coast and then you also mentioned Nashville, in Tennessee. Wilmington, I think was one of the cities you mentioned?

Gen. BEACH. No; I named Memphis, Birmingham, and Nashville as the only cities within reasonable distance or within such distance that they could receive their power by direct transmission. I probably might have included Chattanooga also.

The CHAIRMAN. How far are they from this place?

Gen. BEACH. They are all probably within a distance of 150 or 200 miles.

The CHAIRMAN. So that it would not be impossible to supply them with power if this plant were developed as it is proposed to develop it.

Gen. BEACH. But Birmingham is already fully supplied by the Alabama Power Co. from its power plants on the Coosa River. Chattanooga is also already provided with power from the power plant at Hale's Bar, about 8 miles below the town. That leaves only the two other cities.

The CHAIRMAN. Of course, it might develop some competition in the supplying of power.

Gen. BEACH. That would be a matter that would be under the public utilities commissions of the States.

The CHAIRMAN. At any rate it would supply an additional factor in supplying power to the various communities.

Gen. BEACH. Yes, sir. I told all the parties who came to consult with me with regard to making a proposition, that it was my idea that the United States did not desire to install this power plant for the purpose of being a disturbing element to vested interests; that, other things being equal, we would give preference to that proposal which fitted in best with existing conditions and did not destroy established business which had already been built up at considerable expense and time.

The CHAIRMAN. General, in the memorandum which you prepared for the Secretary of War and which is referred to as Exhibit E in his letter to the Speaker of the House of Representatives, you say that "the Engineer Department's estimate made in July, 1921, for completing Dam No. 2, with its full-power equipment is in round numbers, \$28,000,000; and in August, 1921, for constructing Dam No. 3, \$28,000,000." The estimate of Mr. Ford's engineers for completing Dam No. 2 in round numbers is \$23,430,000 and for Dam No. 3, \$19,000,000; in other words, the estimates of the engineers for the two dams is \$56,000,000, while the estimates of Mr. Ford's engineers is a little over \$42,000,000. How do you explain such a great disparity in the estimates?

Gen. BEACH. There is really very little difference in most cases between Mr. Ford's unit price and the unit price of the Engineer Department. If one were building a dam and had unusual good luck and was not called upon to provide for contingencies, it might be possible to get through with Mr. Ford's figures. Our figures are an estimate for an appropriation. We have to allow for contingencies, and when one is engaged in large construction in a big river like the Tennessee he has to provide a large appropriation for contingencies because of floods, or even ordinary freshets, or delays and interruptions to the work. You can easily see if we were caught in a big flood, our derricks thrown over, and our cofferdams washed out, we would have to spend a great deal to get back to where we were before.

The CHAIRMAN. I have seen that exemplified in California.

Gen. BEACH. I made the remark at one interview with Mr. Ford when I was present that I never in all my experience had seen a man engaged for the first time in river work that he did not make an underestimate. Mr. Ford smiled and said he could bear me witness to that effect; that he had started on one little improvement which he expected would cost from twelve to fifteen thousand dollars, and it had cost him over \$100,000. But we felt we could not send an estimate here to Congress and then find, on account of large floods or serious interruptions to work, that we were running short of funds and then have to come back and ask for another appropriation. We have made our estimate at that figure at which we feel that we can, so far as human foresight can go, complete the work for the amount asked, and if we have good fortune and are not interrupted by great floods or have any disaster on the work we hope we can complete it at a sum well within our estimate and have something to return to the Treasury.

The CHAIRMAN. Later on, in this estimate which you made of \$28,000,000 for each of the dams, you reported to the Secretary of War that by reason of prices after the war having come down considerably you thought you would be able to complete both dams for \$50,000,000.

Gen. BEACH. There is another feature connected with the estimate for Dam No. 3. We have made no attempt at examination of the rock on which that dam will rest. Our information is to the effect that it is not as good rock as the rock at Dam No. 2.

Mr. Ford has made more of an examination. I believe he had parties make an examination for him at Dam No. 3 which is more extensive than the examination we have made. But our information is not definite enough at that locality to allow us to submit an estimate for a better state of foundation than we believe we may encounter.

The CHAIRMAN. In this same memorandum you state that the indirect benefits accruing to the United States are the maintenance of a nitrate plant in readiness for war emergency. You put that first. Is that still your opinion in regard to the matter?

Gen. BEACH. My opinion, Mr. Chairman, is that preparedness is of the first importance, and that we ought not to be caught a second time as we were a short while ago.

The CHAIRMAN. So that the use of nitrates for explosives in case anything happens ought to be looked after primarily by the officials of the War Department before they take up the matter of fertilizer and things of that kind.

Gen. BEACH. I can not understand anybody who is acquainted with the conditions being willing to put the United States in such a position that in case of hostilities it would have to depend upon securing its nitrates from a foreign source of supply.

Mr. HULL. General, if you completed the dam, how long a time do you estimate it would take, that is, Dam No. 2?

Gen. BEACH. Mr. Hull, I have a saying which I try to live up to, that no man ever gets a date out of me, but in order to answer your question to the best of my ability I would say that if we are not unduly interrupted by floods or some big disaster of some kind, we ought to be able to get through with that work in two and a half or three years.

Mr. HULL. If you finish it, you ought to be able to finish it under the same conditions, of course, as Mr. Ford would finish it, approximately as cheaply as he would finish it; is that not true? I mean taking into consideration the character of the work that would go into the dam.

Gen. BEACH. As far as the cost of the materials is concerned, we probably could obtain them as reasonably as Mr. Ford. I think we could buy our cement, obtain our sand and gravel, and obtain the machinery at as reasonable a figure as he could. We are limited in our work to an 8-hour day. Mr. Ford, in all probability, would not be limited to an 8-hour day. And there are other restrictions which might interfere with our work. Under an Executive order we have to give our men a half holiday on every Saturday between the 15th of July and the 15th of September. That amounts to an appreciable item. Mr. Ford, on those two items, might be able to do the work at a somewhat less price than it would cost us.

Mr. HULL. Suppose the Government was to finish the proposition in the next two or three years. You know something about the power situation. Do you think it would be possible for the Government to sell the power to such an advantage that it would pay the interest on the investment, on the entire cost of Dam No. 2?

Gen. BEACH. I have very serious doubts as to our ability to dispose of that power immediately, if we completed the dam ourselves. I have no doubt as to our ability to develop a market for the power in course of time; but if Mr. Ford's offer is accepted, we have a market immediately developed. I understand, not from Mr. Ford himself, but from people who have talked with him in regard to the matter, that he intends to utilize this secondary power, which is a very large proportion of the product, in a way that we would have considerable difficulty in finding a customer for. In other words, I believe he proposes to install electrical furnaces. They would be used whenever the power is available, and he could utilize the secondary power in that way to great advantage, and do it immediately, whereas we would probably not be able for a good many years, if we were marketing the power ourselves, to find a customer who could use this secondary power, except for the purpose of relaying it, as I mentioned awhile ago.

Mr. HULL. Was it your branch of the Army that made the contract with the Alabama Power Co. as to the transmission line?

Gen. BEACH. We have had nothing to do with the Alabama Power Co., except to accept a deed from them for the land on which they acquired flowage rights.

Mr. HULL. You know nothing about this contract?

Gen. BEACH. Nothing that I would like to express an opinion upon.

Mr. HULL. You expressed an opinion here in regard to the limit of time. You have already made a contract, as I understand it, a minor contract, perhaps, for a hundred years, down there. Is that not so? I understood you had made such a contract.

Gen. BEACH. No, sir.

Mr. HULL. Was there not one contemplated?

Gen. BEACH. Not by my department.

Mr. HULL. If I understood you correctly, you think that there might be something in the contention that in a proposition of this kind it would not be unreasonable to give them a hundred-year lease?

Gen. BEACH. I expressed the opinion that there were conditions at this locality regarding the state of development, the character of development of the surrounding

country and the amount of power involved which would make the development of the market for this power under ordinary circumstances slower than it would be in other places, and that I did not think, on account of those conditions, that you should necessarily apply the same rule simply because you had the rule.

Mr. HULL. You have read the offers of Mr. Ford, both the first offer and the second offer in modified form. Do you care to express any opinion for the information of the committee as to what you think we should do?

Gen. BEACH. That is practically the same question, is it not, which the Secretary hesitated so long yesterday in answering, and the member of the committee who asked it offered to withdraw it if the Secretary did not want to answer it?

Mr. HULL. That is the same question.

Gen. BEACH. I would say this, that there is one feature of the case connected with an award to Mr. Ford that appears to be worthy of consideration, and that is this: The Tennessee River possesses an immense potentiality with regard to water-power development. I believe there is no stream in the country, considering the amount of water which is carried and the steepness of its slope, which will furnish the amount of water power that the Tennessee River has, except perhaps the St. Lawrence River. At Muscle Shoals we count on about 100,000 primary horsepower and about 410,000 or 450,000 secondary horsepower.

Mr. HULL. That is at Dam No. 2?

Gen. BEACH. Yes; but every dam that is built on the upper Tennessee which will restrain the flood waters and let them out gradually during the low-water season will increase the primary power at Dam No. 2, with a corresponding decrease in the secondary power. Mr. Ford has said that if he obtained the lease of this property at Dam No. 2, or the lease of the property according to his proposition, he intends to come in and make application for other dams on the upper river and develop them up there above with the idea of utilizing the power which he can obtain from them and increasing the value of the power which he has made arrangements to obtain by his offer at Dam No. 2. That one feature of the case alone appears to me to be worthy of the most careful consideration by Congress, for I believe that the leasing of Dam No. 2 to Mr. Ford will be followed by a development along the Tennessee River which would be very material, and would probably amount in a few years to more than you would get in any other way in the course of a generation or two.

Mr. HULL. That is a very comprehensive answer, and I think it is what the country wants to know. Have you any opinion to express in regard to the effect upon the river navigation in the development of the two dams?

Gen. BEACH. The navigation of the Tennessee I regard as of great importance—that is, the development of navigation. The Tennessee River is one of the richest rivers in the country in regard to mineral deposits along its banks. They have immense coal fields in eastern Tennessee, and in the upper reaches of the Tennessee River, which have not been touched. They have some coal beds up there, I understand, which are 30 feet thick in solid coal, and any development which would permit that coal to reach the market economically would be, I consider, of national importance. The Tennessee River is not subject to the same floods that the Ohio is subject to, and yet it carries practically the same amount of water throughout the year that the Ohio does above the junction of the two streams. The reason for that is that the upper waters of the Tennessee lie in a region where they receive the rainfall of storms that come from Arkansas and Texas, moving northeast, and they also feel the effect of rainstorms that come up the coast and do not extend west of the Appalachian system. The consequence is that the Tennessee carries a larger volume of water than almost any other stream in the United States in proportion to the area of its watershed.

Mr. HULL. You have given us a very comprehensive answer to that question. There is another question I would like to ask you. You have some development down there in what is known as a stand-by condition. Your whole organization, as I understand it, is decimated and gone, and you would have to reorganize, which would take you some time. Have you any opinion as to what that would cost the Government?

Gen. BEACH. Yes, sir.

Mr. HULL. Will you give us that?

Gen. BEACH. It is close to \$20,000 a month, so far.

Mr. HULL. That continues as long as it stands there; is that true?

Gen. BEACH. And we have any money to meet the pay roll.

Mr. HULL. In other words, we ought shortly to do something with it.

Gen. BEACH. Yes, sir; because you are spending that amount of money, practically \$200,000 a year, without one cent's benefit from it.

Mr. KEARNS. General, most of your testimony has been along the line of developing water power for commercial purposes, and very little has been said about the manufacture of nitrate for the purpose of making fertilizer. What is Mr. Ford's idea as to developing water power and manufacturing nitrate for fertilizer?

Gen. BEACH. It is very hard to tell what another man's idea is if he has not talked himself, and all that I have to go on, in reply to your question, is the remarks that have been made to me by Mr. Ford, not directly on this point, and those which have been repeated to me by people with whom he has conversed on the subject. I know that Mr. Ford has the idea that he would like to stand in the same relation to the farmer and to agricultural pursuits that John D. Rockefeller stands in to-day in regard to the eradication of disease and the promotion of medical science. He has said that he hoped to be able to get the production of his machines to such a price that the farmers can buy a Ford automobile, a Ford tractor, and a Ford truck, all for \$1,000. And I have every reason to believe that he aspires to go down in history as the man who has done the most to develop the agricultural resources of his country and the agricultural possibilities of the world.

Mr. KEARNS. In his talk with you has he discussed the building of other dams by means of which he might produce greater horsepower?

Gen. BEACH. That has been mentioned, not with me, but with other parties who have reported the conversation.

Mr. KEARNS. Do you know how many tons of nitrate are used in the manufacture of fertilizer throughout the United States to-day?

Gen. BEACH. No, sir, I do not.

Mr. KEARNS. Can you get that information?

Gen. BEACH. Yes, sir. I understand that representatives of the American Farm Bureau Federation have requested to be heard by this committee. They can give you more definite and direct information on that subject in five minutes than I can in an entire afternoon.

Mr. KEARNS. Has your department those figures?

Gen. BEACH. No, sir.

Mr. KEARNS. Do you know how many tons of nitrate could be manufactured at Muscle Shoals, provided Mr. Ford were to get the plant and operate it at its full capacity?

Gen. BEACH. No, sir, I have no information on that. That is entirely outside of my province.

Mr. KEARNS. Can you get it?

Gen. BEACH. I can get it for you very readily, sir.

Mr. KEARNS. Has not some bureau of the War Department those figures?

Gen. BEACH. The Ordnance Department, whom you have just heard, has more information on that point, or should have it, than any other branch of the Army.

Mr. KEARNS. I would like to get it from that department if I could. Can you get it from them?

Gen. BEACH. I would prefer, if there are no objections, and I am to bring that information to you, to go where I think I can get it most reliably and accurately.

Mr. KEARNS. Has not the Ordnance Department these figures, and will those figures not be reliable?

Gen. BEACH. I would not like to say they would not be reliable, because they ought to be, and if they have not got those figures themselves they ought to go to the best place to get the information.

Mr. KEARNS. I would like to get the information from as many different sources as possible in order to show how nearly they correspond, and whether any reliability can be placed in any of the figures.

Gen. BEACH. I will be very glad to do that, and if I can get information I will do this: I will try to obtain it from different sources, and if I find they do not agree I will try to reconcile them for you.

Mr. KEARNS. If they do not agree, why can you not put the different answers in the record and show the disagreement?

Gen. BEACH. That is what I mean. I only meant I would try to see whether the different estimates had any explanation, just as in the case of Mr. Ford's figures for completing the dams and mine, which although they are quite different, yet as soon as the reasons for those different figures are given the discrepancy is perfectly intelligible to any man.

Accurate figures upon fertilizer production are difficult to obtain; those noted in the table following have been derived from the following sources: The American Fertilizer Handbook for 1921; Bulletin No. 798, United States Department of Agriculture, The Survey of the Fertilizer Industry; Census Bureau's Advance Summary Concerning the Fertilizer Industry, May 18, 1921; Senate Document No. 551, Sixty-fourth Congress, first session, Report on the Fertilizer Industry by the Federal Trade Commission. The following is quoted from the American Fertilizer Handbook with regard to its statistics: "Following is a list of States showing the consumption of fertilizers for the fiscal years ending in 1913, 1914, 1915, 1916, 1917, 1918, 1919, and 1920, compiled from the most reliable statistics that are obtainable. In some of the States there are absolutely no accurate figures available; in these States estimates have been made

based on information obtained from State officials and fertilizer manufacturers. Bulletin No. 798, Department of Agriculture, contains figures prepared by the assistant to the secretary in charge of fertilizer control for 1917 and 1918, during which years the fertilizer industry was under Government supervision, and figures should be quite reliable. The Census Bureau report gives figures for 1914 and 1919; in this case, however, there is apparently some duplication, which makes the totals appear greater than they might be expected to be. The report of the Federal Trade Commission quotes figures from the American Fertilizer Handbook for 1915, hence they are not reproduced.

There are apparent discrepancies between the figures of the Department of Agriculture and the Fertilizer Handbook for 1917 and 1918. It must be remembered, however, that fertilizer is sold in two important forms, namely, mixed fertilizer and acid phosphates. A certain amount of the acid phosphates, sold as such, is bought by the manufacturers of mixed fertilizer for use in their product. It is evident that we must subtract from the acid phosphate, sold as such, the amount used in mixed fertilizer in computing the total fertilizer production. If this is done, figures of the Department of Agriculture tally closely with those of the American Fertilizer Handbook. If similar precautions are taken it is possible to make the Census Bureau figures also tally with reasonable closeness with those of the American Fertilizer Handbook. It should here be noted that the latter's figures are for consumption and not production.

The percentage of nitrogen in mixed fertilizer is a variable quantity. Computations based on the statistics of the Department of Agriculture would indicate that in 1917 the percentage of nitrogen in mixed fertilizer was 3.4, whereas the same source would show that in 1918 the percentage was only 2.5. Best available sources, though uncertain, indicate that this percentage varies on the average between 2.5 and 3.5. Again using the figures of the Department of Agriculture and assuming the production of nitrate plant No. 2 at Muscle Shoals as 110,000 tons of ammonium nitrate per annum, the tables show that this plant at that capacity would produce for those years from 25 to 30 per cent of the total nitrogen used in mixed fertilizer.

The foregoing discussion does not take account of organic fertilizer such as fish scraps, dried blood, cottonseed meal, etc., as these products form only a small and uncertain proportion of the total fertilizer produced. The foregoing considerations also seem to show that the figures of the American Fertilizer Handbook are in the main reasonably accurate as regards total fertilizer consumption.

Fertilizer production.

[All figures in tons (2,000 pounds) unless otherwise noted.]

	1914	1915	1916	1917	1918	1919	1920

Ammonia in mixed fertilizer.....						Per cent. 4.2	Per cent. 3.0
Nitrogen in mixed fertilizer.....						Per cent. 3.4	Per cent. 2.5
Total nitrogen supplied by nitrate plant ³						25	31

¹ Federal Trade Commission's report in 1916 states that 80 per cent of all fertilizer produced is in the form of mixed fertilizer. (P. XVI.)

² There is no nitrogen in acid phosphate.

³ Based on 110,000 tons of ammonium nitrate, or 38,500 tons of nitrogen, the estimated annual production of nitrate plant No. 2, at Muscle Shoals.

FERTILIZER TONNAGE BY STATES.

Following is the list of States, showing the consumption of fertilizers for the fiscal years ending in 1913, 1914, 1915, 1916, 1917, 1918, 1919, and 1920, compiled from the most reliable statistics that are obtainable. In some of the States there are absolutely no accurate figures available. For these States indicated by an asterisk, estimates have been made, based on information obtained from State officials and fertilizer manufacturers.

Mr. PARKER. General, under this contract or proposition of Mr. Ford, he agrees to complete the construction work at the two dams and install the power, etc., for the United States at actual cost, and without profit to the company. That makes him a contractor with the United States. Would he not therefore be bound by the rules as to the 8-hour day, Saturday half holidays, etc.?

Gen. BEACH. That is quite questionable. If we were to simply make a contract to complete that dam, take over the construction of the dam and complete it without the usual form of contract specifying that he must adhere to the 8-hour law, I would say myself that the 8-hour law would not apply.

Mr. PARKER. This is a contract with the United States to complete a dam and to do certain work at actual cost. In carrying out the details and making a contract, under the statutes should not that be put into the contract?

Gen. BEACH. That is questionable. At any rate, he is not bound by the Saturday half-holiday provision. He would have that advantage. It has been held in a number of cases that even where the 8-hour law applies, it does not apply to subcontractors, and it seems to me it would depend on the manner in which that contract was made, as to whether the 8-hour law was a necessary part of the contract or not.

Mr. PARKER. I only brought it up because you said it would apply to him: I was a little doubtful about it and you are a little doubtful about it.

Gen. BEACH. Yes.

Mr. HILL. General, I understood you to say the United States at the present time was expending about \$27,000 a month at Muscle Shoals. Does that take into consideration the amount of rental received from the Alabama Power Co.?

Gen. BEACH. We are not receiving any rent from the Alabama Power Co. Those properties which have been leased to the Alabama Power Co. belong to the Ordnance Department and not to the Engineer Department.

Mr. HILL. Then I would like to try to get those two things coordinated. You say the Engineer Department is spending about \$200,000 a year down there at the present time.

Gen. BEACH. Yes.

Mr. HILL. Do you know how much the Ordnance Department is receiving in rentals?

Gen. BEACH. They stated that they had made the lease at the rate of \$10,000 a month, or \$120,000 a year, plus certain other features, which varied with the amount of power supplied, I believe.

Mr. HILL. I was not clear from the Secretary's statement yesterday as to whether Muscle Shoals at present is costing the Government anything ultimately or not. I understood the Secretary to say that the income from leases at the present time was such that Muscle Shoals was not costing the Government anything.

Gen. BEACH. I understood the Secretary's reply to refer to the nitrate plants and not to the dams.

Mr. HILL. I would like to ask that question as to the whole proposition. Can you give us that? We will be asked that question undoubtedly on the floor as to what the stand-by situation is at the present time.

Gen. BEACH. I will very gladly do that.

Mr. WURZBACH. General, quite a thorough examination and survey was made during the year 1915 by the Engineer Department with reference to the foundations at both these dams, No. 2 and No. 3, was there not?

Gen. BEACH. We have had no survey made at No. 3 of such character that I would like to be held responsible for the detailed plans and the foundations. We would have to make further examinations at No. 3.

Mr. WURZBACH. Maj. Burgess, I think, made a report on that, did he not?

Gen. BEACH. At No. 2.

Mr. WURZBACH. Did that not include No. 3?

Gen. BEACH. No, sir; No. 3 was only referred to incidentally.

Mr. FROTHINGHAM. I would like to ask you, General, where the Tennessee River rises. Does it rise in West Virginia, or eastern Tennessee?

Gen. BEACH. The Tennessee River rises in Virginia, and North Carolina.

Mr. FROTHINGHAM. Virginia, or West Virginia?

Gen. BEACH. Part of it goes up into West Virginia, as well as Virginia. I think there are some small branches there, but the West Virginia portion is so small as to be practically negligible.

Mr. FIELDS. General, what is the annual cost of the Muscle Shoals Canal?

Gen. BEACH. The probable annual cost of the present Muscle Shoals Canal would run in the neighborhood of between \$30,000 and \$40,000.

With regard to the question in reference to the condition of Dam No. 2, I would like to show the committee some pictures that illustrate the present progress of the work. I would state as you see by this map, which is right here in front of you, which most of you have examined, the river is divided at this point by an island, and the total length of the dam is about 4,800 feet, nearly a mile long. We have pushed the concrete work on the island a little faster than at other points, because we could work in the dry at that point, and we wanted to leave as much as possible of the waterway for the river. Consequently, the greatest height of the dam, as shown by these pictures, is on the island. This one, which I suggest be kept separate [indicating photograph], is a view from the south bank, looking north, showing the entire work, with our construction camp on the other bank, and this one with the little house down in front [indicating photograph]

is a view from the north bank looking toward the south. They will give you a better idea of the construction than you can get from my description of it.

Mr. FIELDS. At the suggestion of Judge Parker, I will ask you at this point how much the water is raised there by the dam?

Gen. BEACH. We have not raised the water any as yet.

Mr. FIELDS. How much will it be when it is completed?

Gen. BEACH. One hundred feet.

Mr. FIELDS. What did you say the annual cost of the Muscle Shoals canal is?

Gen. BEACH. Between \$30,000 and \$40,000. That varies, depending on how many locks have to have new gates, and other matters of that kind.

Mr. FIELDS. The use of that canal would cease with the construction of the dams Nos. 2 and 3, would it not?

Gen. BEACH. That would be entirely drowned.

Mr. FIELDS. The Government would be saved that amount of expense for all time to come; that is, as far as the operation of the canal is concerned.

Gen. BEACH. Yes. The cost has varied between \$35,000, which I think is about as small as we have ever had, up to \$85,000, but it will probably average between \$40,000 and \$50,000.

Mr. FIELDS. Mr. Ford offers to pay the Government \$35,000 and \$20,000, respectively, for the maintenance of Dams 2 and 3, and the operation of the gates and locks. The Secretary of War suggests to Congress the advisability of letting Mr. Ford do that work himself and relieve him of paying this amount. Is it not a fact, General, that the operation of the locks pertains strictly to navigation?

Gen. BEACH. I did not understand the Secretary's proposition to relate to the locks at all; it was simply relating to the maintenance of the dams and the controlling gates on the dams.

Mr. FIELDS. I may have misread it. He proposes to relieve the Government of the expense of operating these locks and gates. I was going to ask the question, if the operation of the gates was not strictly a governmental function?

Gen. BEACH. Oh, yes; we could not allow anybody else to operate the locks or the lock gates for us. The dam is provided with controlling gates across the entire length of the dam, which will regulate the height of the water in time of flood, and those are the gates which Mr. Ford must necessarily operate if he operates the power house. The operation of those gates is necessary in connection with the operation of the power house.

Mr. FIELDS. The government could not delegate to him any function which is connected with navigation.

Gen. BEACH. It could not, and would not.

Mr. FIELDS. I misconstrued the Secretary's letter to that extent. The Secretary also suggests on page 10 the operation of plant No. 2 as a power proposition and the sale of its product. I will ask you to place in the record at this point, General, an analysis showing the cost of the operation of power plant No. 2 by the government for a term of six years, and what its income would be from such operation. I would like to see where we would be on a proposition of that kind.

Gen. BEACH. You want the cost of operation of the power plant itself and the dam for the first six years?

Mr. FIELDS. Yes, and the proceeds, or the value of its income. I would like to have a statement showing the interest on the investment for the time Mr. Ford is building these dams. It might be well to state the interest on this proposition too.

Gen. BEACH. I will be glad to do that.

Mr. FIELDS. How many concerns are operating under franchises from the Government in navigable streams for a period of 99 years, or an indefinite period?

Gen. BEACH. I do not recall any offhand that are operating on a 99-year basis. There are some power plants in navigable streams without any limitation, the most noted one being the dam across the Mississippi River at Keokuk, Iowa.

Mr. FIELDS. It was an indefinite lease?

Gen. BEACH. There is no term to the permit which was granted that company.

Mr. FIELDS. What is the term of the one across the Tennessee River at Chattanooga River?

Gen. BEACH. At Hales Bar?

Mr. FIELDS. Yes.

Gen. BEACH. That has no term.

Mr. FIELDS. And the permit of the Alabama Power Co. at Lock 12 is indefinite?

Gen. BEACH. That is indefinite. That portion of the Coosa River is not navigable and will not be navigable until a large number of dams are built.

Mr. FIELDS. Under the recent power act, what has been the progress of the development under the 50-year lease plan? Have they been able to finance projects, in your opinion?

Gen. BEACH. You must remember, Mr. Fields, that that is not my province and I only have such information as comes to me incidentally.

Mr. FIELDS. I know, but by reason of your position you would get probably much more information than the balance of us would get, and if you have no objection to answering the question I should be very glad to have your opinion. But if you prefer not to answer it I shall not press it.

Gen. BEACH. I would not like to make a statement in regard to the matter because I do not feel that the information which has come to me was presented to me in the same manner and with the same care that a person would make that statement if he knew I were going to quote it and the statement be spread throughout the country. In other words, we find in holding hearings with regard to river and harbor matters, that it is of the greatest importance to have those statements made in writing if we can get the parties to do so, because they will make statements, they will be carried away with enthusiasm, or if they believe their statements would affect the parties to whom they are presenting them they will make them a little bit stronger.

Mr. FIELDS. A little more reckless.

Gen. BEACH. A little more reckless, and because of that they would not feel that it is fair to those parties to quote them, nor would I like to be in a position of stating those opinions made to me in that way.

(Thereupon the committee adjourned at 3.55 o'clock to meet to-morrow, Friday, February 10, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Friday, February 10, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. Gen. Beach, when we adjourned last night, Mr. Fields was asking you some questions, and we will continue from that point.

STATEMENT OF MAJ. GEN. LANSING H. BEACH, CHIEF OF ENGINEERS, WAR DEPARTMENT—Resumed.

Mr. FIELDS. General, when we adjourned yesterday we were discussing operations under leases of 99 years, or for indefinite periods. Has there been any development of facts in the operation of any of these long franchises that you know of that would now seem to make a franchise of that kind undesirable, that is, the long franchise?

Gen. BEACH. The only power dams that are located in navigable rivers at the present time were built before the national water power act was passed, and they have no limit whatever. They are simply there with rights in perpetuity, and Congress when it passed the water power act, took the position that the use of the water power was likely to become so valuable that the conditions might change very materially, and the privilege which was given these parties might become so valuable that they thought a readjustment at the end of a definite period would be advisable, and they put that period at 50 years. Now, that was the view of Congress, and the point that I made yesterday was that while that might be very advisable in the ordinary case, such as minor streams, for instance, like the Coosa or the Allegheny, or rivers of that kind, yet in the case of Muscle Shoals, with as large a river as the Tennessee, and considering conditions of business in that vicinity, it would be advisable, I think, to consider the circumstances very carefully and see whether they were not such as to justify an exception to the rule.

Mr. FIELDS. In other words, you do in a way, at least, measure the tenure of the franchise by the magnitude of the proposition?

Gen. BEACH. Not entirely. I would take all conditions into consideration. I tried to invite attention yesterday to the fact that there was no immediate sign of a market at this locality. There are only four towns within the ordinary reach of direct electric distribution from Muscle Shoals—Chattanooga, Birmingham, Nashville, and Memphis. Birmingham already is supplied with electrical power by the Alabama Power Co.; Chattanooga is supplied with power from Hales Bar, a dam on the Tennessee River 8 miles below that city. Nashville, I find, is also supplied by power from a dam on one of the small streams in the State of Tennessee, and that leaves Memphis alone as the only likely immediate market for all the electric power at Muscle Shoals, and the situation seems to be very similar to a man's establishing a large department store. If a man has a capital of \$10,000, and that is all he can raise, he can find a market for his goods in almost any small town. But if he is going to establish a store with a million dollars capital, he has to go where he can sell his goods, or he has to have time to work up a trade which would justify that expenditure.

Mr. FIELDS. And it will require a longer time to work up that kind of trade than with the \$10,000 stock?

Gen. BEACH. Exactly; and that is the point to which I am inviting attention. You are establishing a million dollar store, so to speak, here in this community, where the population and the business interests are not yet sufficient to support it. I just want to invite attention to the fact that the consumption of electricity is something that I do not believe is generally understood. People see electric

lights burning, street cars running, and they think that a large quantity of electricity is being used. Now, I understand that the entire electric lighting of the whole State of Alabama does not require more than about 25,000 horsepower. If you go into Chattanooga you will see a little building, not much more than a shed, not much larger than a three-automobile garage, standing beside the railroad track. That little building uses more electric power than all of the rest of the city of Chattanooga put together, because it has some electric furnaces in there for use in making electroferrosilicon, and those electric furnaces alone use more than all the other industries, the lighting and the running of the street cars in Chattanooga.

Mr. FIELDS. You spoke of Memphis being the only possible market at this time. It is probable, is it not, that the plants at Memphis are equipped for the production of additional industries that would require additional electric power?

Gen. BEACH. I have been told, but I do not know whether the information is authentic or not, that Memphis could probably not absorb more than 50,000 horsepower in all particulars, if the dam were built.

Mr. FIELDS. Then, aside from that, a market must be found by the lessee, whoever takes this proposition, for the entire consumption of power?

Gen. BEACH. Yes, sir; the entire use of power.

Mr. FIELDS. That is what I mean. The Alabama Power Co. could not use it, apparently, from their statement, could they?

Gen. BEACH. They have said so, in connection with the installation of the new unit which they are putting in at Duncans Riffe, on the Coosa River.

Mr. FIELDS. They are putting in a new plant there now?

Gen. BEACH. They have received a permit for that recently, and work has just started, and they said that with the installation of that plant they would be more than supplied with power for the immediate future.

Mr. FIELDS. For the benefit of the committee will you put that statement of theirs in the record?

Gen. BEACH. I have just made it.

Mr. FIELDS. You have covered what they said in your statement?

Gen. BEACH. Yes, sir; but I have a copy of their letter, and I will read you what they said on that point. This is a letter addressed to me, dated July 14, 1921, in which they say:

"Since that letter was forwarded to you (referring to their former letter) the Federal Power Commission has issued to this company a license to construct the Coosa development. We are planning to install 60,000 horsepower, and preliminary construction is now beginning. It is our purpose to prosecute the work with all diligence, with the view of having power available therefrom in the spring of 1923. While the initial installation as now planned is 60,000 horsepower, the ultimate installation will be 120,000 horsepower. In going forward with this development we considered that we were in duty bound to proceed, because it did not seem at all possible that the Muscle Shoals hydro development could produce any power during 1923 or 1924. Our power demands are at present in excess of our waterpower capacity, but the power which will result from the new Coosa development will fulfill our immediate requirements—that is, will enable us in 1923 to greatly reduce our steam running—and we will thus be enabled to meet the public demands during 1923 and for the most part of 1924 with the output of our hydro plants.

"However, we wish to say that study of the power markets in the territory served by our company convinces us that the demands for power will require further sources, which should be available during 1925 at the latest.

"We must make our plans for several years in advance of actual power needs, and longer notice than one year in advance of actual date at which the Muscle Shoals power could be delivered would be necessary for this company to commit itself for the taking of definite amounts of power; and unless a commitment can be made not later than March, 1922, by the United States Government, for the delivery of definite amounts of power we will find it necessary to proceed with another hydro development in Alabama to meet our requirements. We will be glad, meanwhile, to discuss the subject with you in a definite way if desired."

Mr. FIELDS. Did not the Alabama Power Co. plant supplement the secondary power at Muscle Shoals, the power from storage reservoirs on the Coosa and Tallapoosa Rivers, when they made their offer of 1913?

Gen. BEACH. It is my understanding that they did.

Mr. FIELDS. And that dam was in the interest of navigation, was it not?

Gen. BEACH. It could be made so. But their dams do not contemplate the installation of locks, and unless the pools formed by the different dams reached from one to the other, they could not produce a through navigation at all. They would, of course, create the possibility for navigation in the pool formed by each dam, if that dam were provided with a lock for the passage of boats.

Mr. FIELDS. It is possible, but not probable, under that arrangement that it would furnish navigation?

Gen. BEACH. There is the possibility.

Mr. FIELDS. What part of the flowage of Dams Nos. 2 and 3 would properly be chargeable to navigation?

Gen. BEACH. That is one of those questions which can be answered quite differently according to the basis you take for the calculation.

Mr. FIELDS. Then I would take this basis: If you are preparing for a project for navigation alone, you would have so much flowage. If you are preparing for navigation and hydroelectric power, you would have additional flowage, and I would find a difference between the flowage for necessary navigation alone and the total.

Gen. BEACH. If we were going to provide locks and dams on the Tennessee for navigation purposes only over the section of the river we are considering at Muscle Shoals, the cost would be about \$8,000,000. If you take the cost of the works applicable to navigation in the locks at Nos. 2 and 3, you get a cost of about \$4,500,000 for navigation.

Mr. FIELDS. I notice that the Secretary of War said that Mr. Ford should pay interest on all flowage charges on Dam No. 3. Has anybody in the United States ever made a proposition to pay interest to the United States on the part of the project that is chargeable to navigation?

Gen. BEACH. I do not recall any such proposition. I would state with regard to the wording of Mr. Ford's proposition with regard to the flowage damages at No. 3, that I do not understand his statement in the way that it has been apparently understood by parties who have spoken before this committee.

Mr. FIELDS. I understand there is some difference of opinion on that.

Gen. BEACH. In other words, the interpretation which I have placed on that is this: I understood Mr. Ford to state that he would not procure those rights, leaving it to the Government to procure them by its right of eminent domain. But he does not say that the cost was not included in the cost of construction, and I did not understand his statement to mean that the United States must assume all the cost of the flowage rights, but that it merely meant that the United States must acquire them, and did not prevent the United States from including that amount in the costs of the work.

Now, I would like to just invite attention to one feature of the question of land condemnation. If the Government, or a very wealthy party like Henry Ford, desires land, it immediately goes up tremendously in value, and it seems to me that it would be only a good business move on Mr. Ford's part to place the acquisition of that land upon the Government under the right of eminent domain; and I did not understand, and I do not yet understand, that his proposition means that he is opposed to that being included in the cost of the work.

Mr. FIELDS. I agree with you on that, from my reading of the proposition; and yet I know there is a difference of opinion, and I was trying to bring out some facts for our guidance in the future. In that connection, the maintenance of a reservoir up there is a very necessary appurtenance to the production of hydroelectric power, is it not? A pool must be maintained, and therefore it becomes a part of the project.

Gen. BEACH. Oh, yes. You can not obtain a uniform and a definite supply without a pool of considerable magnitude, or a reservoir of sufficient area to furnish a uniform supply during the lower stages of the stream.

Mr. FIELDS. And the maintenance of the pool naturally requires flowage rights, and therefore you would connect flowage rights with the production of the power.

Gen. BEACH. As Napoleon said, "You can not make an omelet without breaking eggs," and you can not make a pool without overflowing.

Mr. FIELDS. I notice in House Document No. 20, of the Rivers and Harbors Committee, that the Board of Engineers on May 18, 1914, said that the amount of approximately \$8,575,000 is the value of the proposed improvement at Muscle Shoals that would be chargeable to navigation, and the remainder would be chargeable to power development. Would that statement be true to-day? In your opinion, would the condition that prevailed then, or the estimate made at

that time be a proper estimate at this time of the amount which would be chargeable to navigation?

Gen. BEACH. If you are going to use that basis for determination; that is, if you are going to allow the amount which the United States would have to spend in order to provide navigation over this stretch of river without providing any power whatever.

Mr. FIELDS. Would Dam No. 2 alone make the river navigable over the shoals?

Gen. BEACH. No, sir; it needs Dam No. 3 also.

Mr. FIELDS. How much 6-foot navigation would you get from Dam No. 2?

Gen. BEACH. We would get 6-foot navigation up to the side of Dam No. 3.

Mr. FIELDS. That would be the minimum?

Gen. BEACH. Yes.

Mr. FIELDS. How much 6-foot navigation would you get from Dam No. 3?

Gen. BEACH. Dam No. 3 would back the water up a good deal farther than Dam No. 2, because that section of the river does not have as steep a slope. I have not looked up the exact figures recently, but it is my impression that it would go about 60 miles.

The CHAIRMAN. If you will permit me, Mr. Fields, the Secretary of War in his letter to Congress shows that it will go 63 miles.

Mr. FIELDS. Dam No. 1 has nothing to do with the power proposition, but relates to navigation only?

Gen. BEACH. Dam No. 1 is navigation only. It is a dam with a small lift, too small to be provided with a power-house adjunct.

Mr. FIELDS. It does not amount to a very large item?

Gen. BEACH. I think our estimate for that is about \$1,400,000.

Mr. FIELDS. I believe you stated yesterday that no examination had been made for the foundation of Dam No. 3. I have House Document 1262, Sixty-fourth Congress, first session, which states on page 54 that some inspection was made there. I just wanted to call that to your attention. You probably had forgotten that when you testified yesterday.

Gen. BEACH. I was going to ask the committee for permission to say a word upon that point, because I found by speaking with certain parties that my statement was misunderstood.

The CHAIRMAN. You may proceed to explain that.

Gen. BEACH. I did not mean to say that no examination had been made. What I intended to say, or what I desired to be understood as saying, was that the examination which we made into foundation conditions at Dam No. 3 had not been sufficient to let us make a definite plan for the foundations at that locality. We have had several borings, and the borings have shown some cavities. Now, the borings we did make were not sufficient to develop the extent of those cavities, or to determine to what extent that rock underneath the sand was honeycombed, and I felt we had to allow a greater amount for the foundation conditions at that locality in our estimates than might possibly be necessary if we had fully developed the facts at our disposal.

Mr. FIELDS. I believe this report shows that 133 holes were bored, and in the 133 holes three cavities were found. I will insert it in the record at this point.

(The report referred to by Mr. Fields is as follows:)

Below is given a table showing core recovery at each dam site:

	Dam No. 2.	Dam No. 3
Number of holes.....	90	15
Total linear feet in rock.....	3,194	4,947
Aggregate length of cores recovered.....	4,501	4,106
Percentage of core recovery:		
Maximum.....	99.0	98.4
Minimum.....	73.0	52.4
Average.....	88.4	80.7
Seams:		
Number.....	100	78
Aggregate depth (feet).....	22.94	18.55
Cavities:		
Number.....	12	3
Aggregate depth (feet).....	24.85	25.90

Gen. BEACH. I have here the estimates for lock and dam No. 1. It is \$1,400,000, as I stated a few moments ago.

Mr. FIELDS. General, the Secretary of War states that the Air Nitrates Corporation has notified him in writing, or the letter probably went to you in

reply to the invitation you extended, and that is why I ask you this question—that the Air Nitrates Corporation claims the right to exercise the option which it claims to have to purchase Nitrate Plant No. 2 under as favorable terms as offered by Mr. Ford. Was this Air Nitrates Corporation invited to submit bids along with Mr. Ford and the other people to whom invitations were extended?

Gen. BEACH. I do not remember whether an invitation was sent to them or not. I would have to look that up. I would like to state that their letter has not been referred to my office, as far as I know.

Mr. FIELDS. Do you know whether or not an invitation was extended to Mr. James B. Duke?

Gen. BEACH. It was.

Mr. FIELDS. Do you know what his connection is with the Air Nitrates Corporation?

Gen. BEACH. I understand that he is closely connected with that company.

Mr. FIELDS. Do you know whether or not he is also connected with the American Cyanamid Co.?

Gen. BEACH. I have been told that he is, but I have no proof of my own knowledge.

Mr. FIELDS. Did Mr. Duke submit a proposition to lease plant No. 2?

Gen. BEACH. He did not. He wrote a letter stating that the whole project at Muscle Shoals was very inadvisable and foolish on the part of the Government. That is practically a synopsis of his letter.

Mr. FIELDS. Will you put his letter in the record in its entirety?

Gen. BEACH. I will.

Mr. FIELDS. Do you know whether or not Mr. Duke requested Mr. Lee to prepare a recommendation or a letter upon the subject, and if so, was it submitted by Mr. Duke or by anyone else?

Gen. BEACH. Mr. Duke sent Mr. Lee's report to me. I have here Mr. Duke's letter which I could read, if the committee would care to have it.

Mr. FIELDS. I would be glad to have it read for the information of the committee.

Gen. BEACH (reading):

SOUTHERN POWER CO.,
New York, June 24, 1921.

LANSGING H. BEACH,
Major General, Chief of Engineers, United States Army,
Washington, D. C.

DEAR SIR: In further reply to your letter in which you ask whether I am interested in any arrangement that might enable the Government to derive a reasonable return from its investment should it complete the Wilson Dam and hydraulic power plant at Muscle Shoals, on the Tennessee River, let me say that I have given this subject some consideration. I have also examined the report of Mr. W. S. Lee, vice-president and chief engineer of the Southern Power Co., on the Muscle Shoals situation. My conclusions follow:

1. The steam-power stations built during the war to supply the Government's nitrate plants—No. 1, at Sheffield, Ala., and No. 2, at Muscle Shoals, Ala.—are of the most modern design and of high efficiency for use in connection with the nitrate plants. They are adequate sources of power for these plants in the emergency of war. They render unnecessary for military purposes the completion of the Wilson Dam and hydroelectric power station.

2. Under the law appropriating money for Muscle Shoals hydroelectric development, cooperation between the Government and any private corporation in the use of such development is specifically forbidden. Unless this law is amended the Southern Power Co. can make no use of power from this dam.

3. The cost of the Muscle Shoals hydroelectric development, estimated before the war at \$18,000,000, in April, 1920, by the Secretary of War at not less than \$25,000,000, and in February, 1921, by representatives of the Government at \$50,000,000, will be not less than \$53,000,000 if completed at this time. This cost is of importance as indicating the difficulty which the Government will encounter in securing an adequate return upon its investment should it complete this project now.

4. The primary power available at Muscle Shoals has, in Mr. Lee's opinion, been largely overestimated. Measured in kilowatt hours annually at various load factors that power will be as follows:

At 100 per cent load factor, 413,018,000 to 416,107,000 kilowatts.

At 90 per cent load factor, 371,716,000 to 374,496,000 kilowatts.

At 65 per cent load factor, 268,462,000 to 270,470,000 kilowatts.

At 35 per cent load factor, 144,556,000 to 145,637,000 kilowatts.

I understand that the Government has been advised that the primary output will be 700,000,000 kilowatt hours annually, using the flow as it occurs each 24 hours. The serious discrepancy between 700,000,000 kilowatts and Mr. Lee's estimates arises from two causes:

A. The consulting engineer advising the Government has used as his minimum the average monthly minimum flow. Mr. Lee has taken as his minimum the minimum flow. Under the first method a heavy rainfall during the last of the month increases the average flow for the whole month, and therefore the minimum power estimate for that month. Inasmuch as the power station can not during the first of the month operate on water which falls during the last of the month, Mr. Lee's method of computation must, in my opinion, be followed, if we are to secure dependable estimates.

In this connection it has been suggested to one of the congressional committee investigating Muscle Shoals that there has been constructed above the Wilson Dam storage sufficient to overcome any periods of dry weather. Large storage projects have been projected, but Mr. Lee has investigated those actually constructed and finds that they are not of size sufficient to increase substantially the primary power of Muscle Shoals.

B. The Government's estimate of 700,000,000 kilowatt hours annual primary output and the revenue to be derived from it assumes a load factor of 100 per cent. I know of no public utility corporation that attains such a load factor.

The load factor of the Southern Power Co. is less than 50 per cent. I would regard a load factor of 65 per cent as unduly favorable to the project; no power company in the South has such a load factor, but even at that figure the primary power for Muscle Shoals will be less than 40 per cent of the 700,000,000 kilowatt estimate.

The power companies of the South can not take power from the Wilson Dam at a 100 per cent load factor, for they have plants which can furnish all the power they need for this part of the load. Under the plan proposed to the Government for Muscle Shoals power distribution the power companies of the South would have to shut down a part of their power equipment in order to use the 100 per cent of the primary power from Muscle Shoals. This they can not afford to do.

5. So far as the Southern Power Co. is concerned, the cost of transmission from Muscle Shoals to the Southern Power Co.'s market is prohibitive. Not less than 420 miles of transmission line would be required. The capital investment involved would exceed \$20,000,000. Transmission costs based on so large an investment are more than the traffic will bear. As a matter of fact, for \$20,000,000 the Southern Power Co. can develop in its territory more hydroelectric power of its own than could be transmitted over the proposed transmission lines. Furthermore, if the Government will, at its own expense, construct transmission lines from North Carolina to Muscle Shoals the Southern Power Co., after investing \$20,000,000 in new hydroelectric plants in its territory in North Carolina, will sell to the Government at the North Carolina end of such transmission lines primary power at 3 mills per kilowatt-hour on the 100 per cent load factor proposed by the Government, instead of at the four and four-tenths mills charge proposed by the Government for primary power at the Wilson Dam.

The market for power from the Muscle Shoals Dam has, in my opinion, been overestimated. The demand for power in this district during the war has materially decreased. Some companies have an excess supply. The shortage in any one company or in all combined, including those which, like the Southern Power Co., are too far away to take from Muscle Shoals, is less than the primary output of the Shoals and is likely to remain so for some years. One reason for this overestimate is that the Government's consulting engineer has counted on supplanting most of the steam power within electric transmission distance. In practice all steam power can not be replaced by hydroelectric. There are many isolated cases where the cost of transmission is so great that steam power remains cheaper even though generated by an inefficient plant.

6. I have said enough of the cost of generating power in the territory of the Southern Power Co. and of transmission costs to indicate that the estimates of the price at which power can be sold from the Wilson Dam will prove disappointing. Primary power on a 40 per cent load factor is being sold in the South at 20 per cent less than the rate proposed for the sale of power from

the Wilson Dam. It only remains for me to add that the estimates of revenue to be derived from the sale of secondary power are even less reliable. There is no dependable market for four months' secondary power in the southern field.

With every desire to assist the Government in the solution of its problem at Muscle Shoals I am forced by the facts to the conclusion that the Government should leave the permanent work as it is and salvage the construction plant. The Government should then wait until labor and materials render possible the completion of the project at reasonable cost and until there has developed some near-by use for power at the Wilson Dam at an 80 or 90 per cent load factor.

The loss in discontinuing and deferring the work will be small compared to the loss which will inevitably be sustained if the work is completed at this time. Meanwhile, the Government should maintain the nitrate plants and their steam power stations in stand-by condition, ready for war.

In my opinion, the United States Government can not, at the present time, complete the Wilson Dam and hydroelectric plant and obtain a reasonable return on its investment.

I have referred several times to Mr. Lee's report on this subject. This report is exhaustive. I have no doubt that, should you wish to avail yourself of the information it contains, Mr. Lee would be glad to hand a copy to you.

Very truly, yours,

J. B. DUKE, *President.*

Mr. FIELDS. So this gentleman who is insistent upon his right to lease this proposition does not think very favorably of it for some reason, and therefore it seems he would not go very far toward the operation of it if the Government should turn it over to him.

What is the American Cyanamid Co.? Where does it operate? Is it connected with Niagara Falls?

Gen. BEACH. It has a plant at Niagara Falls. I understand the larger portion of its production comes from the Canadian side.

Mr. FIELDS. And at any other points in the country? What is the extent of its operations?

Gen. BEACH. I could not answer that, I do not know.

Mr. FIELDS. Anyhow, it is a part of this Niagara proposition.

Gen. BEACH. That is a fertilizer proposition I have not gone into very thoroughly.

Mr. FIELDS. Do you recall a joint letter written by four southern power companies in response to your request for bids, and would you give us the gist of that letter?

Gen. BEACH. There was a letter received by me on June 2, 1921. It is signed by the Georgia Railway & Power Co., by H. M. Atkisson, chairman board of directors; the Columbus Power Co., by H. H. Hunt, vice president; the Central Georgia Power Co., by P. G. Gossler, vice president; and the Tennessee Power Co., by C. M. Clark, president.

The letter is quite long, being seven pages of legal cap, and in a general way they state they can not utilize the power and they regard the construction as inadvisable. I would state that these gentlemen all came to me together and handed me the letter. After I read the letter I asked them if they realized what impression it made on me, and they said no, and I told them that it struck me as exactly the kind of a letter a man would write me who wanted to buy a horse I had for sale.

The CHAIRMAN. Pardon me, Mr. Fields, will you allow me to get the dates clear in my mind. This letter was written on the 2d of June, 1921?

Gen. BEACH. I notice it is dated at the end. It was dated May 20, 1921, but was presented in person by Mr. Atkisson and the other gentlemen at my office on June 2, 1921.

The CHAIRMAN. And Mr. Ford's first offer was presented on July 8, 1921.

Gen. BEACH. July 8; yes.

The CHAIRMAN. I simply wanted to get those dates in my mind.

Gen. BEACH. These gentlemen state that the completion of the dam is inadvisable, and there is nothing in it.

Mr. FIELDS. I gather from the chairman's questions that he probably has the impression these gentlemen considered a proposition; in fact, they did not submit a proposition at all?

Gen. BEACH. No, sir; they advised me I was wasting my young life in trying to secure propositions.

Mr. FIELDS. In order to keep that matter straight, I will ask you to put that letter in the record.

The CHAIRMAN. Mr. Fields, will you let me ask just one other question: were they asked to submit a proposition?

Gen. BEACH. Yes, sir.

The CHAIRMAN. And this is their answer?

Gen. BEACH. This is their reply.

Mr. FIELDS. Recommending against the development of Muscle Shoals?

Gen. BEACH. Yes, sir.

(The letter referred to follows:)

The United States Government, through Gen. Lansing H. Beach, Chief of Engineers, asks the southeastern power companies the following question:

"The Secretary of War has directed me to ascertain what arrangements can be made to derive a reasonable return upon the investment if the United States completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River."

The answer to that question depends upon a correct determination of the following points:

(1) What commercially usable power output can be produced at Muscle Shoals, Tennessee River, taking into consideration the flow of the river, its characteristics, and Government regulation requiring a uniform river flow for navigation of not less than 10,000 second-feet at all times?

(2) What market is available for the sale of the power and at what rates?

(3) What gross revenue can be derived from the sale of the commercially usable available power output?

ANSWER TO QUESTION (1).

(a) Based on data contained in various reports available, which further investigations have confirmed, the continuous 24-hour primary power, i. e., 100 per cent use of available power, is approximately 700,000,000 kilowatt-hours per annum.

This figure is arrived at by assuming a plant capacity of 100,000 kilowatts and operating at 100,000 kilowatts for 12 daylight hours and at 60,000 kilowatts during 12 night hours. To obtain a plant capacity of 100,000 kilowatts during periods of high water it will be necessary to have an installation considerably in excess of that amount.

The portion of the 700,000,000 kilowatt-hours primary power per annum which could be used under existing commercial conditions in southeastern territory estimated to be 570,000,000 kilowatt-hours per annum maximum, including displacement of approximately 135,000,000 kilowatt-hours at present produced by steam; and in view of the uncertainty of the amount of steam which could be displaced and of the amount of power which could be taken at night, it would be safer to estimate upon not to exceed 500,000,000 kilowatt-hours maximum. It is estimated that the demand for power in southeastern territory will absorb this latter amount of additional power by the year 1927.

There are nine years during the 26-year period covered by the hydrograph of the Tennessee River at Florence, Ala., during which the total availability of primary power on 100 per cent load factor was less than 700,000,000 kilowatt-hours per annum. To supply such deficiencies, which will undoubtedly occur periodically in future as they have in the past, steam backing equal to the full capacity of the Sheffield steam plant, i. e., 60,000 kilowatts, must be exclusively available subject to call to meet such deficiencies; in certain years that capacity would not have been sufficient.

(a-1) The 10-months secondary power which it is possible to produce at Muscle Shoals has little or no commercial value.

ANSWER TO QUESTION (2).

(b) The only market for the power at present available is the market served by the southeastern power companies, and the rates for delivered power permitted to be charged by those companies are the published rates fixed by the various public utility commissions of the States in which those companies operate, and the value of the power at Muscle Shoals must take into consideration all elements of cost between generation and delivery.

ANSWER TO QUESTION (3).

(c) The amount of gross revenue which it will be possible for the United States to derive from the sale of power is definitely fixed by the amount of commercially usable power available and the prevailing rates fixed by public regulation.

REASONS FOR CONCLUSIONS AS TO PRIMARY POWER.

Considering the southeastern territory (including Muscle Shoals) a study of hydrographs of the various rivers now serving the existing and proposed power plants shows that years come periodically when drought is coincident and shortage of water is general. Such years have come with unfailing certainty and will undoubtedly come in future.

The safe capacity rating for public service uses of the existing and proposed water-power developments, even granting the full effect of coordination of watersheds, is limited definitely to the sum total of their respective combined capacity ratings during these low years. This limitation is absolute and contracts to deliver primary power must not exceed it, except as supplemented by steam production.

The hydrograph of the Tennessee River at Florence, Ala., for 26 years (from 1894 to 1919, both inclusive) proves that there were 9 years during the 26-year period when it would have been necessary to use the Sheffield steam plant (and in certain of those years its full capacity would not have been sufficient) to supply the deficiency in primary power. This condition will inevitably occur periodically in future and steam backing equal to the full capacity of the Sheffield steam plant must be exclusively available at all times to supply the deficiencies.

REASONS FOR CONCLUSIONS AS TO 10 MONTHS' SECONDARY POWER.

There is no coordination of the other existing and proposed water-power plants (including both storage and river flow plants) in the southeastern territory under any plan of operation that seems commercially practicable that will convert any large amount of Muscle Shoals secondary power into continuous primary power; at least it would not be safe for public service corporations serving the commercial uses of the public to base contracts on any such result.

The hydrograph of the Tennessee River at Florence, Ala., for 26 years (from 1894 to 1919, both inclusive) shows frequent periods of time varying from portions of a month to an entire month, to several entire months, up to a year, when there is no 10-month secondary power. There are only 3 years during the period of 26 years during which such periods or gaps do not occur. There are 7 years in the 26-year period observed during which there is either no 10-month secondary power at all or only a negligible amount. These gaps in the 10-months secondary power, together with the impossibility of predicting when they will occur, inevitably lead to the conclusion that the 10-months secondary power has no commercial value for public service use capable of measurement.

Steam backing to convert any substantial amount of 10-months secondary power into primary would be very expensive because a steam plant of large capacity would have to stand by subject to call, probably continuously, certainly for large and frequently recurrent portions of almost every year, for operation under extremely variable conditions both as to load and duration of time. Steam stand-by costs would be a permanent annual charge on the cost of the total power output, whereas the annual kilowatt-hour production by the steam plant would be relatively small and very costly, meaning an average cost per kilowatt-hour of the combined water and steam power produced, much in excess of water power cost.

To attempt to convert any substantial amount of 10 months' secondary power into primary power by use of the Sheffield steam plant owing to its characteristics and its location with respect to the distributing companies it would have to serve, would result in such a high average cost per kilowatt-hour delivered to the distributing companies as to make the total water and steam power produced unmarketable at the rates and standards of service fixed by the present rigorous public service regulations in the Southeastern States. The steam plant, consisting of only one unit of 60,000 kilowatts, must be held exclusively in reserve at all times to make up the deficiencies in primary power; therefore it will not be available to convert 10-months secondary power into primary power.

The above brief statement, together with a study of various reports, data, and hydrographs available, including original hydrographs of the Tennessee River prepared new from various standpoints at Florence, Ala., for 26 years (from 1894 to 1919, both inclusive) leads inevitably to the following conclusions in answer to the questions on page 2 of progress report of April 9, as follows:

"(d) From a strictly business commercial standpoint, could private capital afford to undertake the Muscle Shoals development, or make investments to use its output?

"(e) Can the Government afford to invest additional public money in the Muscle Shoals development?

"(f) If the Government, regardless of business considerations, in view of the large investment already made, determines to complete the Muscle Shoals development, on what basis, if any, can the southeastern power companies cooperate so that the United States may 'derive a reasonable return upon the investment,' or any partial return?"

ANSWER TO QUESTION (D).

(g) From a strictly business commercial standpoint, and considering the comparable cost of production of power at existing water-power plants and proposed water-power plants in the southeastern territory, private capital could not afford to undertake the Muscle Shoals water-power development, nor make investments to use its output on the basis of the present plans. Under prevailing conditions and rates for which power is sold under regulation in the southeastern territory the usable primary continuous available power output of the "dam and hydraulic power plant at Muscle Shoals, Tennessee River," can not be sold, delivered to the public-service market, at an average price that will pay operating expenses, taxes, reserve for renewals, and replacements, and a fair rate of interest on the estimated cost of the proposed plant as planned, and upon the necessary transmission system to reach the distant and only market.

ANSWER TO QUESTION (E).

(h) Nor can the United States afford to invest additional public money to complete "the dam and hydraulic power plant at Muscle Shoals, Tennessee River," as planned if the same tests which control the investment of private capital are applied; because on the latter basis it can no be made to derive a reasonable rate of interest on the estimated total investment from the sale of the commercially unsaleable available power to the public service market, nor even on the amount necessary to complete the plant as estimated by Government engineers.

ANSWER TO QUESTION (F).

(i) If the United States, in view of the large investment already made, determines to complete the Muscle Shoals development as planned, the southeastern power companies can cooperate so that the United States may derive a reasonable rate of interest upon some part of the cost of "the dam and hydraulic power plant at Muscle Shoals, Tennessee River." That portion of the investment upon which a reasonable rate of interest may be expected can be worked out with certainty because the flow of the river limits the amount of commercially usable power available and the value of the product is definitely fixed by the rigid public service regulation of rates and service in the Southeastern States.

But the Muscle Shoals water power development is being constructed, and it is reported the United States has already spent approximately \$17,000,000 on "the dam and hydraulic power plant" and navigation improvement there. If the United States decides to complete "the dam and hydraulic power plant at Muscle Shoals, Tennessee River," some of the southeastern power companies can reasonably cooperate with the United States to the extent of formulating and making a definite proposition for the lease of the plant or purchase of its output, but only within the limitations stated above.

Economic conditions new existing, and undoubtedly permanent, demand that any arrangement with the United States for the lease of "the dam and hydraulic power plant at Muscle Shoals, Tennessee River," or for the purchase of the power output of the development must be based exclusively on the com-

mercially usable primary power. The details of this proposition can be readily formulated if the principles and data upon which it is to be based are agreed to.

If it is true (as estimated by the Government engineers) that the cost of the completed dam and hydraulic power plant and navigation improvements at Muscle Shoals, Tennessee River, will be \$50,000,000, exclusive of transmission costs according to the plans upon which it is being at present constructed, a large portion of that amount will have to be charged off or charged to war loss and improvement of navigation, because the portion of the cost upon which the sale to the public-service market of the commercially usable available power output can be made to derive a reasonable rate of interest is limited definitely by the existing regulation by public authorities of rates and service in the southeastern territory.

This statement is based upon engineering data, hydrographs, and estimates of costs as to Muscle Shoals, as compared to actual costs and results of seven southeastern power companies.

CENTRAL GEORGIA POWER Co.,

By P. G. GOSSLER, *Vice President.*

TENNESSEE POWER Co.,

By C. M. CLARK, *President.*

ATLANTA, GA., May 20, 1921.

Mr. FIELDS. General, just one other line of questions and then I am through. If you have it at hand, how much did the Panama Canal cost?

Gen. BEACH. I would not like to say offhand.

Mr. FIELDS. Could you put that in the record?

Gen. BEACH. Yes, sir.

Mr. FIELDS. Has it ever paid 4 per cent on the investment?

Gen. BEACH. I doubt very much if it has. I can ascertain that correctly.

Mr. FIELDS. Will you put that information in the record, and also what it is paying now?

Gen. BEACH. Yes. I believe from what I have heard recently that they are quite proud of the fact that it has recently approached a paying basis, and has more than covered expenses.

Mr. PARKER. May I ask what is the difference between kilowatt and horsepower—in other words, how you reduce kilowatts to horsepower? We have one statement in horsepower and the other in kilowatts.

Gen. BEACH. If you want to reduce kilowatts to horsepower, you divide by seven-tenths.

Mr. PARKER. Multiply or divide by seven-tenths?

Gen. BEACH. Divide by seven-tenths, and if you want to reduce horsepower to kilowatts you multiply by seven-tenths.

Mr. QUIN. Gen. Beach, for the benefit of the record, what is the official title that you hold in the United States Government?

Gen. BEACH. I am Chief of Engineers of the Army.

Mr. QUIN. You are a graduate of the West Point Military Academy, I presume?

Gen. BEACH. Yes, sir.

Mr. QUIN. What year, General?

Gen. BEACH. 1882; quite a ways back.

Mr. QUIN. You have had experience in engineering from that date up until now?

Gen. BEACH. Constantly.

Mr. QUIN. The statements that you have made with reference to the potentialities of the Tennessee River and its tributaries are based on actual experience and observation and knowledge acquired from your long experience in that line of work, as I understand it?

Gen. BEACH. I would state that they are based on quite intimate acquaintance. For four and a half years, before I became Chief of Engineers, I was division engineer of the central division, which embraces the Ohio River and all its tributaries, and I think I have been over every part of the Tennessee River that a boat could go on, and have visited pretty nearly every part of its watershed.

Mr. QUIN. I want the record to show that so that these gentlemen making these propositions in the press trying to discountenance what we are attempt-

ing to do here and what you are attempting to do, may know that you understand your business.

What, in your judgment and from your knowledge of the matter, would it cost to make the Muscle Shoals stretch navigable without the construction of these dams, No. 2 and No. 3?

Gen. BEACH. As I stated, our estimate is something over \$8,000,000.

Mr. QUIN. How much of the Tennessee River and its tributaries is now navigable without the construction of these dams and without the completion of the Muscle Shoals stretch for navigation?

Gen. BEACH. We can carry 6 feet from the Oh'o at ordinary stages; that is, except the very lowest stages, as far as Florence, and we have a 2-foot navigation even at low water between Chattanooga and Knoxville. The portion between Florence and Chattanooga is not ordinarily navigable unless the river gets up several feet above low-water stage.

Mr. QUIN. How much would be navigable with the completion of these dams as contemplated, after they are completed?

Gen. BEACH. Dams No. 1, No. 2, and No. 3 would extend the navigation, as we said a while ago, to a trifle more than 60 miles above No. 3. That would require three low-lift dams between that point and Hales Bar, just below Chattanooga.

Mr. QUIN. How much would be navigable without the completion of the dam but with the opening of the Muscle Shoals stretch for navigation?

Gen. BEACH. I do not think I quite understand your question.

Mr. QUIN. What I am driving at is how much more will the completion of Dams 3 and 2 mean in navigation as compared with not completing the dams, but simply making the Muscle Shoals stretch navigable through dredging or otherwise?

Gen. BEACH. Dams 2 and 3 will extend the navigation about 90 miles.

Mr. QUIN. With the completion of Dam No. 2 and Dam No. 3, if Ford's proposition is accepted, the information is communicated to you that he intends to build other dams above there, as I understood you.

Gen. BEACH. Yes, sir; but I would state that I did not understand that he contemplated building dams in that section of the river below Chattanooga. He would probably, and if he were wise, he would go further up where the slopes are steeper and where the cost of building the dams would be less, and he could get a greater return in power for his money than he could by building them on that section of the river, which is very wide and where the slopes are not very steep.

Mr. QUIN. That would then be the cause of wonderful development of water power, and, of course, allied industries connected with it, if that were done, would it not?

Gen. BEACH. I take it for granted, if I understand your question that Mr. Ford would not build locks and dams unless he had some immediate use for the power which they would produce.

Mr. QUIN. Mr. Ford from your evidence intends to make this a great monument to his life for the benefit of the American people as I understand it.

Gen. BEACH. I did not say that.

Mr. QUIN. You stated it in other language. You stated that he wanted it to be a lifework for the agricultural interests.

Gen. BEACH. I stated in general terms what might be termed as Mr. Ford's desiring to build a monument to himself, but I made no specification as to any stones that he intended to put into that monument.

Mr. QUIN. Well, it occurs to me from the proposition he has made here that there is a large element of philanthropy in his ultimate intentions. If Mr. Ford, with the vast amount of wealth he has—more than 500 men could ever spend—would take upon himself this gigantic scheme involving worlds of work and study and money, it means either one of two things, that he is after amassing more money for himself or that he is endeavoring to accomplish something great for the benefit of the American people. Do you not think that that is a logical conclusion?

Gen. BEACH. Not necessarily. I made the statement that he desired to gain a reputation on certain lines. Now, he might desire to secure that reputation and a good financial return at the same time. I have not the information from him as to whether he desires to separate the two or not.

Mr. QUIN. If it were purely a selfish motive to make money for himself and his family and estate, would it not be a fine thing for the people if those dams

are constructed and this territory developed for the purposes which we believe his proposition shows?

Gen. BEACH. Unqualifiedly so.

Mr. QUIN. Some of the gentlemen engaged in competitive lines of water power think it inadvisable and foolish to proceed and complete these dams and develop this wonderful territory. Did any of them agree to lease it or buy it or submit a proposition that could be placed in a relative or comparative position to the one of Mr. Ford?

Gen. BEACH. Those letters which I have just placed in the record, I think, are the best answers to that question.

Mr. QUIN. To my mind they indicate they do not want it done, and I believe for the reason that it is in competition with their business. You do not know about the production of nitrates personally, do you, of your own knowledge?

Gen. BEACH. No, sir.

Mr. QUIN. That is under Gen. Williams's department. You do not know about the production of fertilizer?

Gen. BEACH. No, sir; not sufficiently to be willing to testify before the committee.

Mr. QUIN. You stated the river would be navigable to Florence, Ala.; where is Florence with reference to Muscle Shoals?

Gen. BEACH. It is practically at the lower end of Muscle Shoals. Dam No. 1 would be at Florence. Dam No. 1 would be just above the railroad bridge which you see on this map, which connects the town of Florence with the town of Sheffield. I would state that the town of Florence, in actuality, is not as large as shown on the map and does not reach up as close to No. 2 as the map would indicate.

Mr. QUIN. You would have, then, 6 feet of navigation from the Ohio River up to Florence at the lower end of Muscle Shoals?

Gen. BEACH. Yes.

Mr. QUIN. How many miles is it between Dam No. 1 and Dam No. 3.

Gen. BEACH. A little less than 30 miles, or about 30 miles.

Mr. FISHER. General, something has been said about the available market for the water power if the Ford offer should be accepted. Have you ever made a survey of the industrial needs of the cities within 150 miles.

Gen. BEACH. No, sir.

Mr. FISHER. You are not familiar with the industrial needs, for instance, at Memphis, except in a general way?

Gen. BEACH. Only in a general way, knowing the city and its general business tendencies and size.

Mr. FISHER. You are familiar with the fact that Memphis is short on power for its industrial needs?

Gen. BEACH. Memphis has no water power immediately available. They have to depend upon coal.

Mr. FISHER. Are you familiar with the fact that even with the steam power that we have for our industrial plants, we are now short on that kind of power?

Gen. BEACH. I do not know.

Mr. FISHER. You are not familiar with that situation?

Gen. BEACH. I do not know the definite data on that point.

Mr. FISHER. You stated you are pretty familiar with the territory through which the Tennessee River flows, I will ask you whether or not the farm lands through that country are sadly in need of thorough, scientific fertilization after many years of cultivation of cotton, and so on.

Gen. BEACH. Are you referring to the lands of the entire State or only those immediately adjacent to the Tennessee River?

Mr. FISHER. I mean the States of Alabama, Georgia, Tennessee, and Mississippi.

Gen. BEACH. I have understood and have been told on my trips through that section of the country that they do need fertilization very greatly.

Mr. WRIGHT. General, the foundations of Dam No. 2 are limestone, are they not?

Gen. BEACH. Yes, sir.

Mr. WRIGHT. There is no question about that being a suitable and safe foundation?

Gen. BEACH. At that particular point we think we are perfectly safe. We went into that question very carefully before we started the construction of the dam. Lime rock is always more or less an uncertain quantity, owing to the

fact that if water can run through it, through a crevice or in any other way, for any length of time, it dissolves the rock and makes cavities. That is the way the Mammoth Cave in Kentucky is formed, and that section of the country is all honeycombed with caverns, and you will find up there in that part of the country there are no creeks at all. You go through a farm and you will find a saucer-shaped depression which is the sinkhole or the drainage for that particular territory. The water collects there and then runs underground and finds its way through these cavities into the Green River and the Barren River and some of the other tributaries. This honeycombed condition exists more or less wherever you have limestone, but the excessive honey-combing which you find in that section has largely disappeared by the time you reach the Tennessee.

Mr. WRIGHT. You made such investigations there at Dam No. 2 that make it practical from an engineering standpoint to construct the dam, so far as the foundations are concerned?

Gen. BEACH. Yes, sir; we carried our borings in some cases over 100 feet in depth into the rock.

Mr. WRIGHT. So you think that is entirely practicable, then?

Gen. BEACH. Yes, sir.

Mr. WRIGHT. What would be the length of Dam No. 2 when completed?

Gen. BEACH. Almost 1 mile. I think it is about 4,800 feet.

Mr. WRIGHT. What would be the height.

Gen. BEACH. One hundred feet.

Mr. WRIGHT. Do you get material conveniently there for the construction?

Gen. BEACH. We obtain the sand and gravel a few miles below from the bed of the river. That is dredged up, washed, and then brought up and placed in bins on the work. The cement, of course, we have to buy and bring in by the ordinary methods of transportation.

Mr. WRIGHT. What are the nearest points at which you can secure this cement?

Gen. BEACH. That has varied. There are some points in northern Georgia where cement is made, and there are cement mills close to the Ohio. There are some in Indiana and Illinois.

Mr. WRIGHT. What is the horsepower which could be developed at No. 2?

Gen. BEACH. We have ordinarily counted on about 100,000 primary power.

Mr. WRIGHT. What is the secondary power?

Gen. BEACH. The secondary power is probably about 440,000 horsepower.

Mr. WRIGHT. General, there is quite a difference in the cost of primary and secondary power, is there not?

Gen. BEACH. To the consumer; yes, sir.

Mr. WRIGHT. I mean, to the consumer.

Gen. BEACH. Yes, sir.

Mr. WRIGHT. Will you please explain the difference between primary and secondary power, and how each is used?

Gen. BEACH. Primary power is that which the company can contract to deliver at the switchboard of the consumer at any time he wants it. Consequently, it has to be power which is available every day or at any hour of the day. Secondary power is power which is not primary power, and you may have different grades of secondary power. For instance, at Muscle Shoals you would have a very large amount of power which might be called primary for 8 months of the year, but it is not primary for the full 12 months. You have another amount which would be primary for six months, if I may use the term in that way, and you have quite a considerable portion which would be primary for four months of the year, a still larger amount. It manifestly follows that anybody that can adopt any method of manufacture or any use for this secondary power is enabled to use it very advantageously. I understand that Mr. Ford contemplates putting in electrical furnaces, and he could use a very large portion of that secondary power almost as advantageously in that way as if it were primary power.

Mr. WRIGHT. General, speaking about transmission, the percentage of loss in the current or in the power is increased the further you undertake to transmit the current, is it not?

Gen. BEACH. Yes, sir; that is, you get less at the end of the line.

Mr. WRIGHT. What is the average percentage of loss in transmitting it 50 miles?

Gen. BEACH. I could not state that offhand, because it would depend a good deal on the methods used. They are constantly improving methods of insula-

tion, and it varies considerably with the voltage at which it is placed. You understand, voltage means what you might call the electrical head, the push of the current, and if you have a high voltage you get through more electricity than if you have a low voltage.

Mr. WRIGHT. It is true that the percentage of loss has been reduced very materially by modern appliances and inventions?

Gen. BEACH. Oh, yes. The extension of the distance to which they are sending electricity now proves that, and I have been informed by some of the best electrical engineers that they soon expect to be able to transmit electricity directly to a distance of 400 miles as efficiently as they formerly did to a distance of 200 miles.

Mr. WRIGHT. Have you made an estimate of how much per kilowatt it would cost to produce power at Dam No. 2?

Gen. BEACH. No, sir; I have not figured that out exactly. Col. Cooper gave that in his testimony, but I have not done that myself.

Mr. WRIGHT. You know the average price at which it is sold by the power companies in that section; that is, primary power?

Gen. BEACH. Yes, sir. Those parties who signed that joint letter stated that they got an average of 9 mills per kilowatt.

Mr. WRIGHT. General, what is the life of an ordinary cement dam such as you are constructing down there?

Gen. BEACH. It ought to be perpetual if your cement is of proper quality.

Mr. WRIGHT. And, of course, properly constructed, there is not much element of risk in its being washed away?

The CHAIRMAN. Mr. Wright, will you permit me to ask just one question?

Mr. WRIGHT. Certainly.

The CHAIRMAN. I think those gentlemen said they were able to furnish the power at 3 mills per kilowatt, whereas it would cost a little over 4 mills if the dam was constructed by the Government?

Gen. BEACH. I asked them what their average selling price per kilowatt was and they told me 9 mills.

Mr. WRIGHT. General, the construction of storage dams on the upper part of the river and its tributaries would very materially increase the production of power at Dams 2 and 3, would it not?

Gen. BEACH. Every reservoir which is built on the Tennessee above Muscle Shoals is naturally beneficial to Muscle Shoals because the difference between the primary power and the second power is due to the loss of water which escapes during high stages of the river and leaves only a relatively small proportion to flow down during the low stages. Every reservoir that is built on the upper section of the river will impound that much flood water, and consequently tend to equalize the flow, keep the flood waters from being wasted, and supposing, naturally, that the outflow from your powerhouse is regular, it will tend to increase the low water flow. Consequently, with the construction of dams on the upper river or its tributaries, the amount of primary power at Dam No. 2 will be increased.

Mr. WRIGHT. General, speaking about the market for this power, you have named Memphis as possibly the greatest prospective market for this power. Of course, there are numerous towns and cities dotted all over that country of smaller size than Chattanooga, Memphis, Nashville, and the others you have mentioned that would be customers for this power, would they not?

Gen. BEACH. I imagine that they would, but I would say from my experience with the people of that section, they are very slow to adopt innovations. I am referring now to the people of the rural sections of that country.

Mr. WRIGHT. But taking good-sized towns like Ozark, Florence, Huntsville, Decatur, and towns of that size and character, they are modern to the extent that they want electric lights and they use a great deal of hydroelectric power in their small industries, do they not?

Gen. BEACH. No, sir; the amount which they would consume in manufacturing and for domestic purposes under present conditions would be very small indeed.

Mr. WRIGHT. It is true, generally speaking, that the use of hydroelectric power is constantly on the increase, is it not?

Gen. BEACH. Oh, yes; decidedly. I find that there are manufacturers that use electric power when it costs them more than steam power. They do that for two or three reasons, one of the first reasons is that it is ordinarily independent of the human equation, as nearly so as you can make it. It does not depend on whether the firemen happen to get hold of some fire water or some-

thing of that kind which incapacitates them from attending to the furnace. It is also cleaner and does not involve the question of ashes or the distribution of ashes and cinders. It also removes one very aggravating feature of the labor-union question.

Mr. WRIGHT. General, getting back to the leased period. I think I understand from what you said pretty thoroughly your position, but is it not true that all power companies or people who want to invest in the construction of electrical plants insist on long-term leases? Is not that the general rule?

Gen. BEACH. It is when they think they have a good bargain.

Mr. WRIGHT. Well, let us analyze that just a little, General. In the first place it requires some years to get the plant constructed and equipped, and that must be taken into consideration, and you estimate that perhaps it would require two and a half or three years to complete Dam No. 2.

Gen. BEACH. Yes.

Mr. WRIGHT. There is an immense amount of capital entering into that project all the while, and the investor is waiting for some return, and then after he gets his plant completed and equipped he must develop a market for his power, and, as you suggested, the more sparsely the territory is inhabited the longer he will be in finding a market for his power.

Gen. BEACH. Yes, sir.

Mr. WRIGHT. All those things must be taken into consideration, and he has his capital invested while he is waiting a market for his product. Is not that the reason for it?

Gen. BEACH. That feature of the case should be taken into consideration, it seems to me, in determining the life of the lease.

Mr. WRIGHT. In other words, you do not think a general, universal rule should be applied to all these projects, and that it should depend on the circumstances in each case?

Gen. BEACH. The point I try to make is that a rule which would be perfectly just and equitable to the lessee in the case of a small installation might be a hardship on a lessee who had a very great amount to dispose of.

Mr. WRIGHT. General, at this moment you can not think of a project of the magnitude of the Muscle Shoals project where you would be more in favor of a long-term lease than at this plant?

Gen. BEACH. No, sir. I think if it is justified anywhere it is justified at this locality.

Mr. WRIGHT. Of course these dams No. 2 and No. 3 would be the property of the Government at the end of the 100-year lease.

Gen. BEACH. Yes, sir.

Mr. STOLL. General, you are familiar with all the great water powers in the United States in a general way?

Gen. BEACH. I have seen several of them.

Mr. STOLL. What I want to know is whether there is any water power in the South equal to the Tennessee River or the Muscle Shoals water power?

Gen. BEACH. No, sir.

Mr. STOLL. Is there any east of the Mississippi River that is equal to it?

Gen. BEACH. Nothing that is installed so far except Niagara.

Mr. STOLL. I mean wholly within the United States. That is partially in Canada, is it not?

Gen. BEACH. Well, you understand that at Niagara Falls it is divided into two portions, and we control our part and the Canadians control theirs.

Mr. STOLL. Well, with the exception of Niagara, is there any water power east of the Mississippi equal to Muscle Shoals?

Gen. BEACH. No, sir.

Mr. STOLL. How about west of the Mississippi?

Gen. BEACH. I doubt very much if you would find anything west of the Mississippi. I do not know of any possible case except—I do not believe even Priest Rapids on the Columbia River would be equal to it, but I am not certain about that.

Mr. STOLL. The Tennessee River project or the Muscle Shoals project, at any rate, is one of the biggest projects in the country.

Gen. BEACH. It is unquestionably one of the biggest projects in the country.

Mr. GARRETT. General, looking back over your many years of experience in developing waterways and water powers, that have meant the great development of the country, has not your great trouble been with pessimists, during all that time, and because they could not calculate the immediate results of a great project, they could not see why it should be undertaken?

Gen. BEACH. That has been, to a certain extent, a drawback, but I would state that I think the greatest drawback to the development has been the opposition of people who think their interests are going to be adversely affected.

Mr. GARRETT. Well, I will accept the answer of the gentleman in that respect in toto. Now, General, you have covered this subject very completely but I just want to get your general idea about projects of this character or about other great projects. So far as the public are concerned, they have not been able at the beginning to see the great results that have followed the work of men like yourself who had the vision of what the development meant. Has not that been one of the great troubles in developing the great waterways of the country, and much of the money that has been spent, at the time it was being spent, when the criticisms were made of the appropriations, were made largely by people who could not see the immediate results, and is it not also true that you can hardly calculate the immediate results? For instance, we will take the Panama Canal, there was great criticism at the time of the beginning of that project, that it would be a failure, and would be a useless expenditure of money. Those critics have all passed away, so far as the Panama Canal is concerned, have they not?

Gen. BEACH. I think I have heard some transcontinental railroads making remarks recently.

The CHAIRMAN. I wanted to ask a question about that very matter when you were through. I was in Congress when we put through the Panama Canal bill and we were told that the probable cost would be \$120,000,000. It finally grew up to \$400,000,000, so that they missed the final cost by a good many million dollars. So that, after all, it is all problematical when you start out, and you can not tell just what you will run up against before you are through.

Gen. BEACH. That is just one of the points, Mr. Chairman, that I endeavored to make yesterday, that while people can make an estimate on unit quantities and the price of the unit quantities, those who have not been accustomed to handling work in the rivers or large works where such an element of uncertainty is involved in the conditions, almost invariably make the mistake of underestimating.

Mr. GARRETT. General, I want to ask you this general, hypothetical question, and you can answer it if you see fit: Assuming when these dams are completed, and assuming that the lease should be left to Mr. Ford as submitted, and taking into consideration the general conditions of the country surrounding this project, the opportunity to manufacture large quantities of fertilizer for the agricultural and the horticultural people and the truck growers and everybody who uses fertilizer, and the extension under modern plans of this electric power far out into the country, all around them, in your opinion, would you consider this a project that should be adopted by the Congress, or would you care to express an opinion upon that particular feature of it?

Gen. BEACH. Your question rather involved two considerations. You spoke about the development of the country and at the same time assigning it to Mr. Ford.

Mr. GARRETT. Or to any one else.

Gen. BEACH. It is my understanding that if Mr. Ford is given the lease of the power from this dam, he will establish industrial plants right in that vicinity. Now, that will unquestionably be an immense benefit to that section of the country, but the general growth due to the existence of that power will naturally, outside of its award to somebody who has the financial ability to develop it immediately, be very slow, indeed. If the member from Tennessee will pardon my saying so, I made the remark about the people in the rural sections down there being very slow. A few years ago I had occasion to hold a hearing on the Tennessee River in order to help the people of Chattanooga obtain flowage rights. Congress had made the appropriation for a dam, with the condition that the flowage rights should be provided without expense to the United States. The people of Chattanooga, in endeavoring to get those flowage rights, found they could not do a thing with the owners of the property. In a few cases they would sell at exorbitant prices, and in a good many cases they would not do anything at all. They asked me to come down and help them, and I went down and held a hearing, and they asked me what the benefits would be if that dam were built. I said that in the first place the construction of the dam would bring in a large amount of money to be spent right in that section. They said: "We do not think so. The contractor will get the money and the store people that he brings along with him will get it, but we won't get any of it." "Well," I said, "What

is more, it will enable you to ship your goods to market more cheaply than you can do so at the present time." They said, "That does not interest us. The middlemen will get all that." I said, "Well, the fact that the property can be developed will bring people down here with money and that will help develop your section." They said, "We have got all the people here now we want and we don't want anybody here with any more money than we have got."

Mr. GARRETT. That is along the same line as these letters you have been receiving from people concerning this project to the effect that it will be a failure. Those who do not want to furnish you any dumping ground or things of that kind were those directly interested and wanted to dispose of whatever they might have to the Government or to the other people at whatever prices they might secure, and they were not taking into consideration the general welfare but were considering their own particular interests.

Gen. BEACH. No, sir; they were people who were perfectly contented to go along the way that they were going, and did not want to be disturbed.

Mr. GARRETT. On that flowage question, did they not argue that the Government should take care of that, and afterwards did not Congress take care of it?

Gen. BEACH. I reported to Congress that it was absolutely impossible to fulfill that condition; that the people could not obtain the lands necessary for flowage rights, and Congress removed the restriction.

Mr. GARRETT. Has it no always been true, General, in all of your experience, that people everywhere, generally speaking, are slow to give way to progress and they are rather slow to change their conditions; that is, in the old, established parts of the country?

Gen. BEACH. You find that a trait of human character everywhere. You know that the people objected to the construction of railroads because a cow might get on the track.

Mr. GARRETT. And the men who drove their wagons objected to that because they would go out of business.

Gen. BEACH. The town of Frederick, Md., paid the Baltimore & Ohio Railroad Co. \$10,000 to keep out of the town because it was one of the important points on the stage route to the West.

The CHAIRMAN. There are one or two things I think you can clear up very nicely, General, in connection with this matter. How long has this matter of the fixation of nitrogen from the air been in existence?

Gen. BEACH. That I could not answer without looking it up.

The CHAIRMAN. It is comparatively recent, is it not?

Gen. BEACH. Yes; I do not suppose it is 20 years old.

The CHAIRMAN. How long has Germany been using that method of securing nitrates, if you can recall?

Gen. BEACH. Well, longer than they let the rest of the world know; but the exact number of years I could not say.

The CHAIRMAN. How long has it been possible to secure nitrogen by fixation from the air here in the United States?

Gen. BEACH. You are getting into a branch of the subject, Mr. Chairman, with which I am not acquainted. This is outside of the work of my department, and I have information upon it only incidentally, and I would not like to give any evidence where my information is of that character.

The CHAIRMAN. My information has been that the whole proposition is comparatively modern.

Gen. BEACH. I do not think there is any question on that point.

The CHAIRMAN. That is, it has only been within 10 or 12 years that the thing has been developed. So that this is all a new development, and therefore it is reasonable to suppose that many additional inventions will be made, and that the process will be materially developed in the years to come?

Gen. BEACH. I do not think there is any question upon that point.

The CHAIRMAN. That is what I had in mind myself.

Mr. MCKENZIE. General, on yesterday afternoon, when you were testifying, I was unavoidably absent, and I am not going to ask you any questions at this time which might be a reiteration of the questions you have already answered. But I want to make an inquiry upon one point.

Under the Ford proposition, one of the things which the Government undertakes to obligate itself to do is the construction of Dam No. 3, and there has been some question and some criticism in connection with that matter, that it might be impossible to construct successfully a dam at that point because of the foundations. If that should happen, you can see it would very greatly change the conditions of the whole proposition.

I want to ask you now, as the Chief of the Corps of Engineers of the Army of the United States, if you are willing to give us unhesitatingly an assurance that in your judgment the Government will be able to perform that part of the contract in case we enter into the contract.

Gen. BEACH. From all the evidence that we have, the results of our borings at the site, I have no reason to believe that the construction of Dam No. 3 is impossible. It may be a little more expensive, proportionately, than Dam No. 2. But we have no reason to believe that it is impossible, and all our evidence goes to the effect that it is perfectly practicable.

Mr. MCKENZIE. You at least without hesitation are willing to assure us that it is a pretty safe gamble, so far as the United States is concerned?

Gen. BEACH. Yes, sir. You would have to buy a bigger pile of chips; that is the only condition.

Mr. MCKENZIE. Can you tell us, offhand, what the present return on the Panama Canal is?

Gen. BEACH. No, sir. I think it has recently gone on a paying basis; that is, it has covered expenses.

Mr. MCKENZIE. I think probably that is true, because I was informed day before yesterday that they had raised the wages down there. I am referring to the cost of operation.

Gen. BEACH. I understand that it is only recently that the revenue of the canal is more than the cost of operation.

Mr. MCKENZIE. It would amount to more than 4 per cent on the investment, would it not?

Gen. BEACH. The present return, as I understand it, has not reached the 4 per cent basis.

Mr. HULL. General, speaking of the worth of horsepower, it seems to me it would be interesting for the committee to know what the value of this horsepower would be, provided it could be sold at the rates that are now prevailing at such developments as Niagara Falls and the Keokuk Dam. I do not mean to say you can sell it, but I would like to know myself, if this dam is completed as proposed in the Ford offer and the power could be sold at the going rates that now prevail at Niagara Falls and the Keokuk Dam, what the value of the horsepower would be. I do not presume you can answer that question offhand, but if you can obtain the information and put it in the record, I shall be glad to have it. You can get that information, can you not?

Gen. BEACH. Yes, sir.

Mr. HULL. I might say, giving my impression of the matter, that the discrepancy in the cost of the Panama Canal, it seems to me, is too great for engineers to permit to go unchallenged. I think if it was investigated we would find that the great share of the difference in the cost of the Panama Canal is due to the change in the plans after they started to work; that is, not all of it, but a great part of it would be due to that.

Gen. BEACH. It would have cost more if they had constructed the Panama Canal on the original plans or continued the construction on the original plans.

Mr. HULL. I understand that, too. There is just another question I want to ask you in regard to Dams 1, 2, and 3. You stated in one place that to make the Tennessee River navigable you would have to build Dam No. 1, I believe, at a cost approximately of \$4,500,000?

Gen. BEACH. No, sir; the amount was \$1,400,000.

Mr. HULL. Then you stated afterwards that if you completed Dams No. 2 and No. 3, as proposed in the Ford offer, you would make the Tennessee River navigable for 60 miles. You meant with Dam No. 1, did you not?

Gen. BEACH. Dam No. 1 is such a short distance below Dam No. 2 that it does not make very much difference. It is only 4 or 5 miles below.

Mr. HULL. I understand that, but what I want to bring out is this: In considering this proposition of making the Tennessee River navigable, the Government will have to build Dam No. 1 itself, because that is not contained in the Ford offer; is that not true?

Gen. BEACH. That is correct; yes, sir.

Mr. HULL. You spoke of some of the power people writing to you. Have any of the fertilizer people interviewed you at all?

Gen. BEACH. No, sir; I have seen none of them.

Mr. HULL. Have they sent you any literature?

Gen. BEACH. I can only say that a few days ago I received circular No. 2, which said that further information could be given me if I desired it. I wrote

for it and it came, I think, day before yesterday morning, when I came up here, and I have not had a chance to read it.

Mr. PARKER. General, you spoke about the amount of waterpower in the United States. We had an investigation of this waterpower matter in connection with the waterpower bill some years ago, and my recollection is that the total amount of waterpower, as stated at that time, is from ten to twenty million, and three-quarters of it is west of the Rocky Mountains, in various streams that come from the snow mountains or in the Columbia River. I suppose you did not go into that investigation in regard to the entire United States?

Gen. BEACH. No, sir. The statement I made yesterday was to the effect that I believed that the Tennessee River had a greater possibility for development of waterpower than any other stream I knew of, except possibly the St. Lawrence River.

Mr. PARKER. You spoke about the western streams, and as I understood you, you said you did not know whether the Columbia was so great. My recollection was that it was larger.

Gen. BEACH. I was asked if this project was not greater than any that could be made upon the Mississippi River and I said I did not know how it compared with some on the Columbia.

Mr. PARKER. And there are likewise very great water powers in the streams coming from the Sierras, because of the enormous fall?

Gen. BEACH. Yes, sir; and they are developing those water powers out there very rapidly, and very beneficially.

Mr. PARKER. You do not make the comparison, then, in total horsepower. That will probably come from the report of the Waterpower Commission, which will tell all about that.

Gen. BEACH. I did not understand that the comparison was in the total. I understood that the comparison was on a single project.

Mr. PARKER. There are more rivers that are good in summer on account of the water coming from the snow mountains, or from a very cold country, like the Canadian rivers, than there are in our zone here, or in most of the United States; is that not so?

Gen. BEACH. Yes, sir.

Mr. PARKER. I pass to the other matter you mentioned, in which you said that the companies gave you the cost per kilowatt hour at about 9 mills, as an average. Did they give you the price at which they sold it?

Gen. BEACH. No, sir.

Mr. PARKER. Had you been informed that about two years ago there was an investigation by the Committee on Interstate and Foreign Commerce of the so-called power bill, in connection with power made by steam in the East and distributed, and that a very important statement was made by a Government witness concerning the price at which the power company sold their power? According to my recollection the statement was that in selling power to small consumers, they had to pay as high as 25 cents, and the manufacturers about 8 cents, but when the companies sold each other they absolutely sold it at about a cent, or a little under. Have you any information bearing upon that matter, or would you have to leave that to other people?

Gen. BEACH. I would have to investigate that matter.

Mr. PARKER. I can not give the exact figures, but there was such a tremendous difference that they seemed astonishing. You do not know whether or not the various power companies sell power to one another by relays and all that sort of thing, at prices as low as 1 cent a kilowatt hour, or that they did sell at prices as low as that?

Gen. BEACH. I know that they sell it commercially in Tacoma and Seattle, that is, power derived from the water coming down from Mt. Ranier at 1 cent a kilowatt hour.

Mr. PARKER. That is water power. I am talking, now, about steam power, and the sales of that power between the different power companies in the East. You do not know about that?

Gen. BEACH. I do not know about that; no, sir.

Mr. PARKER. You did not know that that had been thoroughly investigated at that time, and that the power bill, when it was proposed, did provide such power by establishing great power plants at the coal mines and distributing power from those?

Gen. BEACH. I know the superpower survey has been made. I am not familiar with the details of the report in connection with that.

Mr. PARKER. Who would be able to give it to us?

Gen. BEACH. I think probably Col. Keller, the present Engineer Commissioner of the District of Columbia, would be able to give you as much information on that point as anybody you could call locally.

Mr. PARKER. Does it or not seem to you to be important to know with reference to the value of this place what can be done in that way with steam?

Gen. BEACH. I should think it would be very important.

Mr. FIELDS. General, what time elapsed between the submission of your invitation to Mr. Ford and the receipt of his first proposition?

Gen. BEACH. Probably two months and a half or two months.

Mr. FIELDS. From the time you submitted it to him?

Gen. BEACH. From the time I first wrote to him.

Mr. FIELDS. Until his offer came to you?

Gen. BEACH. I do not think I wrote to him at quite as early a date as I wrote to the power companies in the South, because it did not occur to me at first that he would be interested.

Mr. FIELDS. In Exhibit E, on page 22 of the Secretary's report, which exhibit is signed by yourself, you make an interest charge of \$1,875,000 against the Ford proposition for the investment of the Government during the construction period and the first six years of the lease. Is that an ordinary interest charge, or is not that out of the ordinary on Government propositions?

Gen. BEACH. You will notice in the second sentence below that tabular statement it says "such carrying charges are not customarily considered in Government work."

Mr. FIELDS. Do you know whether or not a charge of this kind has ever been considered in Government work?

Gen. BEACH. I do not know of its ever being included before. I think if the Government did include those that the appropriations by the Rivers and Harbors Committee would be very differently made than they have been made for many years past.

Mr. FIELDS. Upon what do you base that opinion—how do you reason that out?

Gen. BEACH. We have spent in the course of the last 15 years something like \$60,000,000 on the Ohio River to improve that stream, and the interest charges on that, it seems to me, if Congress were going to consider them, would help expedite the work.

Mr. WRIGHT. General, in the construction of these plants and development of electrical current by water power it is very necessary or desirable to have an auxiliary steam plant in connection with it, is it not?

Gen. BEACH. That depends entirely upon the manner in which the power is utilized. If you are selling your power you have to provide some means to cover the production of the total power for which you have made a contract. If you can sell more than your primary power itself, and you have a period where the secondary power is of value, you can supplement your primary power you obtain from the water by a steam plant, making a large portion of your secondary power primary.

Mr. WRIGHT. Then it is very desirable, from the standpoint of a breakdown. The consumer wants his power with regularity.

Gen. BEACH. Yes, sir.

Mr. WRIGHT. That is also an element, is it not?

Gen. BEACH. That is quite an element. We could, of course, guard against that by duplication of transmission lines. It would be a question of whether the duplication of transmission lines for the establishment of a separate steam plant would be more economical.

STATEMENT OF COL. JOHN A. HULL, ACTING JUDGE ADVOCATE GENERAL, WAR DEPARTMENT.

The CHAIRMAN. Colonel, we are discussing the proposition of Mr. Ford for certain rights at Muscle Shoals, and it seems that the Alabama Power Co. and the Air Nitrates Corporation also make claims for those separate propositions. I understand that you have looked into the matter very fully and are in a position to explain the matter to the committee at this time.

Col. HULL. The question as to the Alabama Power Co. was submitted to the office in November with the request to give it great expedition, so it was there a comparatively short time. I made a report to the Adjutant General of the Army, under date of November 16, 1921, and I have a copy of that report with me.

(Thereupon the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

STATEMENT OF COL. JOHN A. HULL, ACTING JUDGE ADVOCATE GENERAL, UNITED STATES ARMY—Resumed.

The CHAIRMAN. Colonel, at the time of adjournment you were going to offer some letter for the record. Will you kindly continue your statement just as you were doing, and in your own way tell the story.

Col. HULL. I stated that at the end of October of last year, the office was asked its opinion as to what steps were necessary to clear title, so that the Warrior-Sheffield transmission line and the Warrior Power Plant and Substation, and other incidental properties of the Government erected by the Alabama Power Co. for the account of the United States and all as described in contract T-69, could be disposed of by the United States to other than the Alabama Power Co., and in such a way that they can all be operated as at present located. As a result, the office prepared an opinion dated November 16, 1921, a copy of which I will at this place insert in the record.

The CHAIRMAN. Is it very long?

Col. HULL. Four pages, sir.

The CHAIRMAN. Would you kindly read it so that the committee may have it before them.

Col. HULL. I will be glad to.

[First indorsement.]

WAR DEPARTMENT,
JUDGE ADVOCATE GENERAL'S OFFICE.
November 16, 1921.

The ADJUTANT GENERAL:

1. In the attached communication, dated October 31, 1921, the Chief of Ordnance states:

"The Secretary of War desires information as to what steps are necessary to clear title so that the Warrior-Sheffield transmission line and the Warrior power plant and substation and other incidental possessions of the Government erected by the Alabama Power Co. for the account of the United States, and all as described in contract T-69, copy of which is attached, can be disposed of by the United States to other than the Alabama Power Co. and in such a way that they can all be operated as at present located.

"The Secretary of War is desirous that this information be supplied at the earliest possible date."

2. Contract T-69, dated December 1, 1917, provided for the construction, maintenance, and operation of the following:

Warrior extension, a new power station, adjacent and in effect an addition to the power plant of the Alabama Power Co. on Warrior Creek, to be erected upon land belonging to the Alabama Power Co.

Warrior substation, a new substation and substation apparatus, to be erected near the Warrior extension, on land belonging to the Alabama Power Co., and to constitute an extension to the switching house of that company.

Muscle Shoals substation, a structural-steel bus and switching structure with concrete foundation, at Muscle Shoals, on land belonging to the United States.

The transmission lines for transmission of electrical current, extending from said Warrior substation to the Muscle Shoals substation, said lines to run over the present right of way of approximately 100 feet in width and 20 miles in length; thence over a right of way to be acquired by the Alabama Power Co. at its own expense, from its present right of way to land of the United States, and thence over the land of the United States to the Muscle Shoals substation.

The quarry branch line, for the transmission of electrical current, extending from a point on the transmission line, near Russellville, to a limestone quarry, the property of the United States, a distance of approximately 3,000 feet, the right of way "to be provided by or at the expense of the United States."

Drifton extension railroad, extending about 8,000 feet from the terminus of the disused Drifton branch of the Southern Railway to the Warrior extension, the right of way from the terminus of said disused track to the property of the Alabama Power Co., and all of the rails and rail-joint material to be furnished by the United States.

This office understands that all of these properties are included in the inquiry which is the subject of the present reference.

Gen. BEACH. I think probably Col. Keller, the present Engineer Commissioner of the District of Columbia, would be able to give you as much information on that point as anybody you could call locally.

Mr. PARKER. Does it or not seem to you to be important to know with reference to the value of this place what can be done in that way with steam?

Gen. BEACH. I should think it would be very important.

Mr. FIELDS. General, what time elapsed between the submission of your invitation to Mr. Ford and the receipt of his first proposition?

Gen. BEACH. Probably two months and a half or two months.

Mr. FIELDS. From the time you submitted it to him?

Gen. BEACH. From the time I first wrote to him.

Mr. FIELDS. Until his offer came to you?

Gen. BEACH. I do not think I wrote to him at quite as early a date as I wrote to the power companies in the South, because it did not occur to me at first that he would be interested.

Mr. FIELDS. In Exhibit E, on page 22 of the Secretary's report, which exhibit is signed by yourself, you make an interest charge of \$1,875,000 against the Ford proposition for the investment of the Government during the construction period and the first six years of the lease. Is that an ordinary interest charge, or is not that out of the ordinary on Government propositions?

Gen. BEACH. You will notice in the second sentence below that tabular statement it says "such carrying charges are not customarily considered in Government work."

Mr. FIELDS. Do you know whether or not a charge of this kind has ever been considered in Government work?

Gen. BEACH. I do not know of its ever being included before. I think if the Government did include those that the appropriations by the Rivers and Harbors Committee would be very differently made than they have been made for many years past.

Mr. FIELDS. Upon what do you base that opinion—how do you reason that out?

Gen. BEACH. We have spent in the course of the last 15 years something like \$60,000,000 on the Ohio River to improve that stream, and the interest charges on that, it seems to me, if Congress were going to consider them, would help expedite the work.

Mr. WRIGHT. General, in the construction of these plants and development of electrical current by water power it is very necessary or desirable to have an auxiliary steam plant in connection with it, is it not?

Gen. BEACH. That depends entirely upon the manner in which the power is utilized. If you are selling your power you have to provide some means to cover the production of the total power for which you have made a contract. If you can sell more than your primary power itself, and you have a period where the secondary power is of value, you can supplement your primary power you obtain from the water by a steam plant, making a large portion of your secondary power primary.

Mr. WRIGHT. Then it is very desirable, from the standpoint of a breakdown. The consumer wants his power with regularity.

Gen. BEACH. Yes, sir.

Mr. WRIGHT. That is also an element, is it not?

Gen. BEACH. That is quite an element. We could, of course, guard against that by duplication of transmission lines. It would be a question of whether the duplication of transmission lines for the establishment of a separate steam plant would be more economical.

STATEMENT OF COL. JOHN A. HULL, ACTING JUDGE ADVOCATE GENERAL, WAR DEPARTMENT.

The CHAIRMAN. Colonel, we are discussing the proposition of Mr. Ford for certain rights at Muscle Shoals, and it seems that the Alabama Power Co. and the Air Nitrates Corporation also make claims for those separate propositions. I understand that you have looked into the matter very fully and are in a position to explain the matter to the committee at this time.

Col. HULL. The question as to the Alabama Power Co. was submitted to the office in November with the request to give it great expedition, so it was there a comparatively short time. I made a report to the Adjutant General of the Army, under date of November 16, 1921, and I have a copy of that report with me.

(Thereupon the committee took a recess until 2 o'clock p. m.)

the plant and transmission lines under certain circumstances not yet developed. The question presented to this office is how best to free the Government's plant and transmission lines from any interest which the Alabama Power Co. has therein, so that, if authorized, it may, if so advised, dispose of the property to some other purchaser or lessee free and clear of the rights of the Alabama Power Co. As to the lands constituting the right of way and site upon which the transmission lines and power plants are located, the United States has authority, under section 124 of the national defense act above cited, and other condemnation statutes, where funds are available, to proceed by condemnation if necessary to acquire the interest of the Alabama Power Co. therein; and that feature of the situation presents no difficulty. There remains but the right of the power company to purchase the plants and transmission lines belonging to the United States which by the terms of the contract are made personality and its right, in the event that the United States should take the plants and lines under the terms of the contract and dispose of them to some other purchaser, to compel the United States or such purchaser to remove the same from the real estate. This right to compel removal will, of course, be nugatory in the event of the acquisition by the United States of the real estate upon which the transmission lines and plants now stand. This leaves to be considered only the contract right, if any, of the Alabama Power Co. to purchase the property of the Government which, by the terms of the contract, is to be considered personality.

This contract was entered into December 1, 1917; then and now there is no authority for the sale of this plant or any part thereof. Therefore, the option to purchase purporting to be given by the contract is unauthorized and void. Consequently the only action necessary is to condemn the land constituting the right of way and plant sites, authority for which is granted by the statute above cited.

J. A. HULL,

Acting Judge Advocate General

Col. HULL. I might state that the conclusion that this option is null and void is based specifically on article 4, section 3, clause 2, of the Constitution, which reads in part as follows:

"The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States."

The CHAIRMAN. Colonel, section 124 of the national defense act of June 1916, contains this provision:

"The plant or plants provided for under this act shall be constructed, operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital."

Are you familiar with that section?

Col. HULL. Yes, sir; I cited that in my memorandum.

The CHAIRMAN. That was passed on the 3d of June, 1916, and became law of the land on that date.

Col. HULL. Yes, sir.

The CHAIRMAN. This contract with the Alabama Power Co. was negotiated in December, 1917, I think you said?

Col. HULL. Yes, sir; that is the date of the contract.

The CHAIRMAN. Fully a year and a half after the passage of this law by Congress forbidding entering into contracts with any private concern on the part of the United States.

Col. HULL. Yes, sir.

The CHAIRMAN. So that in your opinion the officers of the Federal Government who entered into that contract with this private corporation exceeded their authority, and the whole thing, in your opinion, is therefore void.

Col. HULL. Yes, sir. The option is nonenforceable by the Alabama Power Co.

The CHAIRMAN. Now, will you kindly state anything else with reference to any of these contracts. Was there a contract with the Air Nitrates Corporation?

Col. HULL. Yes, sir; there is a contract between the Air Nitrates Corporation and the United States of America and the American Cyanamid Co. of the United States of America negotiated by the Ordnance Department, on June 8, 1918, which is in relation to nitrate plant No. 2.

The CHAIRMAN. That was practically two years after the passage of the law.

Col. HULL. Yes, sir. The opinion of the office was not specifically asked with regard to this contract, but it also has an option of purchase, I believe. Article of this contract reads as follows:

"Sale of plants: If upon cessation of this war, or for other reasons, the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same and the material terms upon which such disposition shall be made) to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

The same general comment that I made upon the power to grant an option to the Alabama Power Co. applies to this contract.

The CHAIRMAN. Between whom was the Alabama contract made; who were the parties in interest who signed it?

Col. HULL. Between the Alabama Power Co. and the United States of America. The contract was executed by the Ordnance Department, represented by William Williams, an emergency officer.

The CHAIRMAN. Was that Gen. Williams?

Col. HULL. No, sir; that is Gen. C. C. Williams.

The CHAIRMAN. Col. Williams was an emergency officer?

Col. HULL. Lieut. Col. William Williams; yes.

The CHAIRMAN. Who executed the contract on the part of the Alabama Power Co.?

Col. HULL. It was executed by the Alabama Power Co., by James Mitchell, its president.

The CHAIRMAN. How about the other contracts which you have just made reference to.

Col. HULL. The Air Nitrates Corporation contract was executed by parties named at the end. The copy I have does not give the name of its president, but it was prepared to be executed by the president and the secretary of the American Cyanamid Co. and by a colonel of the Ordnance Department of the National Army. At the head it is the Air Nitrates Corporation of the first part and Samuel McRoberts, colonel, Ordnance Department, National Army, the contracting officer, acting on behalf of the Chief of Ordnance of the United States Army.

The CHAIRMAN. Do you know whether or not the contract was duly executed by the respective parties?

Col. HULL. My copy fails to show whether it was formally executed or whether it was proxy signed. I have only a borrowed copy here.

The CHAIRMAN. Could you find that out and state that in the hearings later so that the record may be as nearly complete as we can make it?

Col. HULL. I will be glad to do so.

The CHAIRMAN. I might suggest that you put in the record for the benefit of the hearings the contract in full.

Col. HULL. I will put in the record both contracts.

They are as follows:

[Order No. War—Ord. P 9771—1029 E T 1006—Cont. T—66. Ordnance Department, U. S. Army. Dated and executed June 8, 1918.]

AIR NITRATES CORPORATION AND UNITED STATES OF AMERICA—AMERICAN CYANAMID COMPANY AND UNITED STATES OF AMERICA—CONTRACT FOR ERECTION AND OPERATION OF THREE AMMONIUM NITRATE PLANTS AND LICENSE AGREEMENT IN RELATION THERE TO.

This contract, made this 8th day of June, 1918, by and between Air Nitrates Corporation, a corporation organized under the laws of the State of New York (hereinafter called the "agent"), party of the first part, and the United States of America, by Samuel McRoberts, colonel, Ordnance Department, National Army (hereinafter called the "contracting officer"), acting by and under the authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, party of the second part,

Witnesseth:

Whereas a state of war exists between the United States of America and the German and Austro-Hungarian Governments, constituting a national emergency, and the United States requires the performance within the shortest possible time of the work hereinafter described; and

the plant and transmission lines under certain circumstances not yet developed. The question presented to this office is how best to free the Government's plant and transmission lines from any interest which the Alabama Power Co. has therein, so that, if authorized, it may, if so advised, dispose of the property to some other purchaser or lessee free and clear of the rights of the Alabama Power Co. As to the lands constituting the right of way and site upon which the transmission lines and power plants are located, the United States has authority, under section 124 of the national defense act above cited, and other condemnation statutes, where funds are available, to proceed by condemnation if necessary to acquire the interest of the Alabama Power Co. therein; and that feature of the situation presents no difficulty. There remains but the right of the power company to purchase the plants and transmission lines belonging to the United States which by the terms of the contract are made personalty and its right, in the event that the United States should take the plants and lines under the terms of the contract and dispose of them to some other purchaser, to compel the United States or such purchaser to remove the same from the real estate. This right to compel removal will, of course, be nugatory in the event of the acquisition by the United States of the real estate upon which the transmission lines and plants now stand. This leaves to be considered only the contract right, if any, of the Alabama Power Co. to purchase the property of the Government which, by the terms of the contract, is to be considered personalty.

This contract was entered into December 1, 1917; then and now there is no authority for the sale of this plant or any part thereof. Therefore, the option to purchase purporting to be given by the contract is unauthorized and void. Consequently the only action necessary is to condemn the land constituting the right of way and plant sites, authority for which is granted by the statutes above cited.

J. A. HULL,

Acting Judge Advocate General.

Col. HULL. I might state that the conclusion that this option is null and void is based specifically on article 4, section 3, clause 2, of the Constitution, which reads in part as follows:

"The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or other property belonging to the United States."

The CHAIRMAN. Colonel, section 124 of the national defense act of June 3, 1916, contains this provision:

"The plant or plants provided for under this act shall be constructed and operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital."

Are you familiar with that section?

Col. HULL. Yes, sir; I cited that in my memorandum.

The CHAIRMAN. That was passed on the 3d of June, 1916, and became the law of the land on that date.

Col. HULL. Yes, sir.

The CHAIRMAN. This contract with the Alabama Power Co. was negotiated in December, 1917, I think you said?

Col. HULL. Yes, sir; that is the date of the contract.

The CHAIRMAN. Fully a year and a half after the passage of this law by Congress forbidding entering into contracts with any private concern on the part of the United States.

Col. HULL. Yes, sir.

The CHAIRMAN. So that in your opinion the officers of the Federal Government who entered into that contract with this private corporation exceeded their authority, and the whole thing, in your opinion, is therefore void.

Col. HULL. Yes, sir. The option is nonenforceable by the Alabama Power Co.

The CHAIRMAN. Now, will you kindly state anything else with reference to any of these contracts. Was there a contract with the Air Nitrates Corporation?

Col. HULL. Yes, sir; there is a contract between the Air Nitrates Corporation and the United States of America and the American Cyanamid Co. and the United States of America negotiated by the Ordnance Department, dated June 8, 1918, which is in relation to nitrate plant No. 2.

The CHAIRMAN. That was practically two years after the passage of this law.

Col. HULL. Yes, sir. The opinion of the office was not specifically asked in regard to this contract, but it also has an option of purchase, I believe. Article 19 of this contract reads as follows:

"Sale of plants: If upon cessation of this war, or for other reasons, the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same and the material terms upon which such disposition shall be made) to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

The same general comment that I made upon the power to grant an option to the Alabama Power Co. applies to this contract.

The CHAIRMAN. Between whom was the Alabama contract made; who were the parties in interest who signed it?

Col. HULL. Between the Alabama Power Co. and the United States of America. The contract was executed by the Ordnance Department, represented by William Williams, an emergency officer.

The CHAIRMAN. Was that Gen. Williams?

Col. HULL. No, sir; that is Gen. C. C. Williams.

The CHAIRMAN. Col. Williams was an emergency officer?

Col. HULL. Lieut. Col. William Williams; yes.

The CHAIRMAN. Who executed the contract on the part of the Alabama Power Co.?

Col. HULL. It was executed by the Alabama Power Co., by James Mitchell, its president.

The CHAIRMAN. How about the other contracts which you have just made reference to.

Col. HULL. The Air Nitrates Corporation contract was executed by parties named at the end. The copy I have does not give the name of its president, but it was prepared to be executed by the president and the secretary of the American Cyanamid Co. and by a colonel of the Ordnance Department of the National Army. At the head it is the Air Nitrates Corporation of the first part and Samuel McRoberts, colonel, Ordnance Department, National Army, the contracting officer, acting on behalf of the Chief of Ordnance of the United States Army.

The CHAIRMAN. Do you know whether or not the contract was duly executed by the respective parties?

Col. HULL. My copy fails to show whether it was formally executed or whether it was proxy signed. I have only a borrowed copy here.

The CHAIRMAN. Could you find that out and state that in the hearings later so that the record may be as nearly complete as we can make it?

Col. HULL. I will be glad to do so.

The CHAIRMAN. I might suggest that you put in the record for the benefit of the hearings the contract in full.

Col. HULL. I will put in the record both contracts.

They are as follows:

[Order No. War—Ord. P 9771—1029 E T 1006—Cont. T—66. Ordnance Department, U. S. Army. Dated and executed June 8, 1918.]

AIR NITRATES CORPORATION AND UNITED STATES OF AMERICA—AMERICAN CYANAMID COMPANY AND UNITED STATES OF AMERICA—CONTRACT FOR ERECTION AND OPERATION OF THREE AMMONIUM NITRATE PLANTS AND LICENSE AGREEMENT IN RELATION THERETO.

This contract, made this 8th day of June, 1918, by and between Air Nitrates Corporation, a corporation organized under the laws of the State of New York (hereinafter called the "agent"), party of the first part, and the United States of America, by Samuel McRoberts, colonel, Ordnance Department, National Army (hereinafter called the "contracting officer"), acting by and under the authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, party of the second part,

Witnesseth:

Whereas a state of war exists between the United States of America and the German and Austro-Hungarian Governments, constituting a national emergency, and the United States requires the performance within the shortest possible time of the work hereinafter described; and

Whereas the American Cyanamid Company, a corporation of the State of Maine, is the producer of certain chemicals by the so-called "cyanamid processes" necessary for the production of ammonium nitrate, and is familiar with and controls exclusive patents and processes for the production of such chemicals in this country, and proposes to assist the United States in performing this contract as follows:

1. By licensing the United States and the said Air Nitrates Corporation as agents of the United States to use its patents and processes.

2. By placing at the disposal of the said Air Nitrates Corporation all its experiences, records, and plans appertaining to the production of the said chemicals.

3. By placing at the disposal of the said Air Nitrates Corporation certain members of its executive and technical force for the construction and operation of the plants hereinafter mentioned.

4. By placing at the disposal of the said Air Nitrates Corporation all its plants for the purpose of training superintendents, foremen, and chief operatives.

And the United States proposes to compensate the American Cyanamid Company for the foregoing as set forth in a contract marked Exhibit 1, bearing even date herewith and annexed hereto; and

Whereas the said company is unwilling to subject its property and assets to liability in connection with the planning, construction, and operation of the proposed plants, and has accordingly organized the Air Nitrates Corporation (the agent under this agreement), which shall act as the agent of and which shall be solely responsible to the United States and others in the planning, construction, and operation of the proposed plants, and according to the terms hereof; and

Whereas the United States entered into a contract with the said Air Nitrates Corporation, under date of November 16, 1917, for the construction and operation, as agent for the United States, at Muscle Shoals, Alabama, of a plant for the manufacture of ammonium nitrate, of an approximate capacity of 110,000 short tons of ammonium nitrate per annum, hereinafter referred to as the Muscle Shoals plant, and work thereon has been commenced; and

Whereas it has now become necessary that two additional plants, each with a capacity of approximately 55,000 short tons of ammonium nitrate per annum, shall be constructed and operated at sites to be selected as hereinafter provided; and

Whereas it is desirable that a new contract be entered into for the construction, completion, and operation of all the said plants of an approximate aggregate capacity of 220,000 tons of ammonium nitrate per annum, such new contract to supersede by mutual consent of the parties hereto and in accordance with the best interests of the United States said contract of November 16, 1917:

Now, therefore, in consideration of the mutual agreements herein contained, the said parties have agreed and by these presents do agree with each other as follows:

ARTICLE I.

Exclusive services.—The agent shall engage exclusively in the work of executing this contract, including the designing, constructing, and operating of the plants herein described. It shall use its best endeavors to construct the said plants as quickly as practicable and at the least possible cost consistent with the proper performance of this contract. This shall include availing itself of the cooperation of the American Cyanamid Company to the full extent contemplated in this contract and the one of even date herewith between the United States and the American Cyanamid Company, hereunto attached and marked "Exhibit 1." The agent will maintain such departments as shall be necessary or appropriate for the carrying out of this agreement, including engineering, administrative, purchasing, construction, manufacturing, inspection, labor relations, workmen's compensation, statistical, commissary, police, fire, medical housing, accounting, and legal departments.

ARTICLE II.

Muscle Shoals site.—The agent shall, at the cost of the United States, conclude the negotiations heretofore begun for the acquisition by and in the name of the United States of the site on which said plant at Muscle Shoals is now being constructed.

Selection and purchase of sites for new plants.—The agent, acting as agent for and at the cost of the United States, shall forthwith select two sites, each suitable for the construction and operation thereon of plants of the character hereinafter described for the production of ammonium nitrate. After such sites shall have been severally approved in writing by the contracting officer, they shall be secured at the sole cost of the United States and be conveyed to the United States of America by deeds in form and substance satisfactory to the contracting officer, subject only to such liens and incumbrances as the contracting officer shall approve in writing. The deeds shall be properly executed and acknowledged in form for recording in the counties in which the sites are located.

ARTICLE III.

Plans for and construction of plants.—The agent, acting as agent for and at the cost of the United States, agrees—

1. To proceed with and complete the planning, laying out, constructing, erecting, installing, and equipping of the said plant at Muscle Shoals with an approximate capacity as aforesaid, and to furnish all necessary labor, tools, machinery, and materials, and to do all other things necessary or appropriate thereto. All plans and specifications in relation to said plant heretofore approved by or on behalf of the Chief of Ordnance or the contracting officer shall be considered for the purpose of this agreement as having had the approval of the Chief of Ordnance and the contracting officer.

2. To plan, lay out, construct, erect, install, and equip at each of said two new sites a complete plant, with an approximate capacity as aforesaid, for the production of ammonium nitrate, furnishing all necessary labor, tools, machinery, and materials, and doing all other things necessary and appropriate in the premises.

Each of said plants shall include the necessary land; also necessary lime, carbide, nitrogen gas, lime-nitrogen, ammonia, nitric acid, and nitrating plants; also all necessary temporary buildings, houses for employees, administrative buildings, laboratories, shops, warehouses, hospitals, stores, commissaries, structures, lines of communication and transmission, plant machinery, railway and trolley tracks, dredging, docks, boiler plants, roundhouses, roads, ways, waste disposal and sewerage, water and lighting systems, locomotives, cars, fixtures, tools, equipment, apparatus, and appurtenances; also power houses adequate for the development and transmission of such power for the operation of said plants as can not be advantageously obtained through outside sources or agencies; also gravel pits, limestone quarries, coal mines, and other things, to such extent and in such manner as may be reasonably necessary for the prosecution of the work contemplated by this contract; but no coal mine shall be acquired without the written approval of the contracting officer.

ARTICLE IV.

Operation of plants.—The agent, acting as agent for and at the cost of the the provisions of Article XVII hereof. The agent shall do all things necessarily completed and ready for operation, forthwith to proceed to operate the same and to continue the operation thereof up to June 1. 1921, and thereafter for so long as the United States shall remain in the present war, subject to the provisions of Article XVII hereof. The agent shall do all things necessary or appropriate in and about the operation of said plants, including the procurement of all necessary labor and power and the purchase of all necessary materials.

Operation under this article shall include placing ammonium nitrate produced hereunder, as from time to time directed, on cars or lighters or in warehouses at the site of the plant where manufactured.

Revenue from housing, etc.—Any revenue from the operation of any housing, boarding houses, commissary, stores, infirmary, hospital, or other facilities, or from rebates, refunds, etc., shall be accounted for by the agent to the United States.

ARTICLE V.

Materials.—The United States may at any time furnish the agent any materials necessary for use in the performance of this contract.

ARTICLE VI.

Agent to follow directions.—The agent shall from time to time consult with the contracting officer upon the general character of the work contemplated. Upon written request, made from time to time by the contracting officer, the agent shall inform the contracting officer at the earliest practicable time as to any plan, contract, purchase, and method contemplated in the construction and operation of the plants and properties, and the United States may reject, or from time to time require the agent to modify any such plan, contract, purchase, or method, or to substitute therefor and carry out such other plans, contracts, purchases, or methods as in the judgment of the contracting officer may be in the interest of the United States, all at the expense of the United States. The agent in the planning, constructing, equipping, and operation of the plants shall abide by such directions as the contracting officer shall from time to time give the agent. All such requests and directions shall be in writing or by telegraph, addressed to the agent at its address hereinafter stated.

ARTICLE VII.

Specifications.—The processes and work involved in the manufacture of the final product of ammonium nitrate to be produced hereunder shall be conducted so that said final product may be in accordance with such specifications as the Ordnance Department may from time to time adopt for ammonium nitrate to be manufactured under this contract.

ARTICLE VIII.

Processes.—The said plants shall be constructed for operation under the cyanamid process, unless the United States shall direct that some other process be used, in which case all changes in construction thereby necessitated shall be made by the agent at the cost of the United States.

If at any time hereafter in the judgment of the Chief of Ordnance the oxidation of ammonia and its conversion to dilute nitric acid or the manufacture of ammonium nitrate from dilute nitric acid by interaction with ammonia may be done more advantageously by improved methods or processes of persons or companies other than the agent, the Chief of Ordnance shall be free to call upon the agent to install and use such methods or processes in its operation of the plants, at the cost and expense of the United States. The Chief of Ordnance shall be free to consult with parties other than the agent upon all matters relating to the operation of the plants, to the end that the best results of operation may be obtained.

The agent shall use its best efforts to make contracts with its employees pursuant to which any inventions relating or applicable to the production of carbide, cyanamid, ammonia, and nitric acid or ammonium nitrate made by such employees while in the service of the agent, shall be protected by United States patents, which patents shall become the property of the Air Nitrates Corporation, subject, however, to the condition that it shall grant to the United States at the time of issue of such patent or patents a nonexclusive license without royalty under each and all of them, such license to be restricted to the United States and to the purchasers of any or all of said plants who may receive a license under the provisions of Article X of the agreement of even date herewith between the American Cyanamid Company and the United States. The term "employees" used in this paragraph shall not be deemed to include the persons described in paragraph numbered 3 in Article X hereof.

ARTICLE IX.

Subcontracts.—The agent shall submit to the contracting officer for his written approval, in advance of its execution, any proposed subcontract as to which the contracting officer may direct in writing that his approval be first obtained.

All subcontracts shall contain a reference to this contract and an express provision that they are subject to all provisions hereof and that they may be assigned by the agent to the United States. Upon request in writing a copy of any subcontract shall be delivered to the contracting officer promptly upon the execution thereof.

ARTICLE X.

Costs and expenses—Audit and payment thereof.—The United States shall bear all costs and expenses of every character and description incurred or made in connection with the planning, construction, equipment, and operation of each of the said plants or any part thereof, and in the conduct of any other business or activities of the agent hereunder; and the United States shall supply all money necessary therefor in such amounts and in such manner as to permit all of the agent's activities with respect to the planning, construction, equipment, and operation of the plants to proceed without delays or interruptions and without the necessity of the agent providing any capital or borrowing any moneys. Vouchers for all accounts payable shall from time to time be furnished to the Chief of Ordnance, and upon presentation of satisfactory evidence he shall either furnish the agent funds to the amounts thereof, which funds shall be immediately paid out by the agent under the supervision of a representative of the Chief of Ordnance, or the vouchers may be paid direct by the Chief of Ordnance to the persons entitled to payment thereunder. Such vouchers shall be acted upon by the Chief of Ordnance promptly.

All accounts payable by the United States hereunder, including those in relation to costs and expenses of construction or operation, shall be subject to audit by the United States, which shall maintain at the plants and elsewhere, if necessary, a sufficient number of auditors promptly to audit the same.

To expedite payments to the agent the United States shall detail representatives at each of the said plants and at the agent's home office, with power and sufficient funds to discharge the pay rolls and to make any other payments as they shall become due hereunder. Payments by the United States shall be subject to correction for errors, if any.

The agent shall make no charge to the United States for the following things:

1. For procuring from the American Cyanamid Company a license to it as agent of the United States to use the said company's patents and processes.

2. For procuring from the American Cyanamid Company the disposal, for purposes of the Air Nitrates Corporation, of the said company's experiences, records, and plans appertaining to the production of the said chemicals hereinabove referred to.

3. For procuring from American Cyanamid Company the disposal, for the purposes of the Air Nitrates Corporation, of the following members of the said company's executive and technical force, namely, the president, vice president and general manager, sales and traffic manager, engineering assistant to general manager, superintendent of manufacture, chief technologist, chief engineer, assistant engineer, and in addition thereto, in connection with the operation of the said plants, two principal works managers, as such offices may from time to time be filled.

4. For procuring from the American Cyanamid Company the disposal, for the purposes of the Air Nitrates Corporation, of all of the said company's plants for the purpose of training superintendents, foremen, and chief operatives.

ARTICLE XI.

Agent's compensation.—As full compensation for the services of the agent the United States shall pay to the agent the following fees:

1. *Construction fee.*—Three and one-third (3 $\frac{1}{3}$) per cent of the cost in connection with the construction and equipment of the said plants until such cost (exclusive of the agent's compensation) shall equal thirty million (30,000,000) dollars, and thereafter one and two-thirds (1 $\frac{2}{3}$) per cent of such cost in excess of said thirty million (30,000,000) dollars. Said fee shall be payable monthly upon that portion of the cost for which payment has been made during the month or months preceding and as to which the fee is unpaid. There shall be credited on account of said construction fee any payments for construction compensation heretofore made to the agent under the provisions of said contract of November 16, 1917. The total of the construction fee shall not exceed one million five hundred thousand (1,500,000) dollars.

2. *Operation fee.*—One-quarter of one cent (\$.0025) per pound of ammonium nitrate produced in compliance with Article VII hereof and accepted or utilized by the United States, up to and including 110,000 tons produced in any fiscal year of the United States, and one-eighth of one cent (\$.00125) per pound of

ammonium nitrate so produced and accepted or utilized in any said fiscal year in excess of such 110,000 tons. Payment shall be made monthly.

The Chief of Ordnance may direct the agent to produce at any one or more of said plants products other than ammonium nitrate, and to the extent that such products are not utilized in the making of ammonium nitrate in any of said plants operated by the agent, the agent shall receive as compensation for making such products an operation fee computed upon such a basis as will give the agent for making such products the same amount as the agent, by way of operation fee, would have received (1) where such products are nitrogenous compounds, for fixing an equivalent amount of nitrogen in the form of ammonium nitrate, and (2) where such products are other than nitrogenous compounds, for making ammonium nitrate equivalent in cost to that of such products.

ARTICLE XII.

Basis of cost for construction fee.—The cost upon which the construction fee of the agent is based shall be the entire cost of the construction of the plants herein mentioned, including, amongst other items, those mentioned in Schedule A hereto annexed and made a part hereof. The enumeration of said items shall not be deemed to be inclusive of all items of cost and shall not be construed to exclude in determining cost and the fee thereon other items of expenditure entering into the cost of planning, constructing, and equipping the plants not therein enumerated.

ARTICLE XIII.

Maintenance.—The agent shall, at the expense of the United States, maintain the plants in suitable condition for economical operation, and to this end it shall make all proper repairs. The contracting officer may from time to time specify extraordinary repairs, which shall be made only with his written approval. Should any part of any plant be destroyed wholly or partly by fire or otherwise the Chief of Ordnance shall determine whether such part shall be restored.

ARTICLE XIV.

Title to property.—The title to all property, real or personal, paid for or partly paid for by the United States, shall, immediately upon such payment, or upon coming into the possession of the agent, vest forthwith in the United States.

ARTICLE XV.

Records.—The agent shall keep complete records as to all construction and operation expenses, all of which records shall at all times be open to the inspection of the duly authorized representatives of the United States.

Inspection.—The inspection officers of the Ordnance Department shall at all times have full access to the plants for the purpose of inspecting in every detail all work done, materials used, and ammonium nitrate produced, and becoming familiar with all processes and methods used in the manufacture thereof, and the agent shall afford them all necessary facilities and assistance for performing their duties aforesaid.

ARTICLE XVI.

Loss and damage.—The agent in operating, caring for, and storing property shall use all reasonable effort adequately to protect the same, but this shall not authorize or require the agent to take out or carry insurance for this purpose. The United States shall hold and save harmless the agent from all loss or damage (exclusive of future profits) by accident, fire, flood, explosion, or otherwise arising or growing out of the construction or operation of the said plants and all losses and expenses not compensated by insurance or otherwise.

ARTICLE XVII.

Termination of agreement as to any plant.—In the event that in the opinion of the Chief of Ordnance the public interests so require, this contract may be terminated as to any or all of the plants described herein by notice in writing.

to the agent without prejudice to any claim which either of the parties hereto may then have against the other. In the event of the termination of this contract, as aforesaid, the United States shall pay to the agent all costs and discharge all obligations of the agent rising in connection with the construction or operation of the said plant or plants theretofore properly incurred, but not previously paid or discharged, as to which said notice is given. At the option of the United States the agent shall assign or transfer to the United States all contracts outstanding at the date of termination as to any plant previously entered into by the agent hereunder in respect of such plant. In addition thereto the United States shall make the following payments under the following conditions:

(1) In the event that this contract is terminated as aforesaid as to any plant during the construction thereof, if the agent is not in default in any substantial agreement herein contained, the United States shall pay the agent such percentage of the construction fee provided for in Article XI hereof and not theretofore paid as may be found by the Chief of Ordnance as fairly and justly amounting to the percentage of the work then performed, including obligations incurred in respect to said plant, and for which payment has been or will be made.

(2) In the event that this contract is terminated as aforesaid as to any plant during or prior to the operation thereof by the agent, then the agent shall be paid the sum of money, if any, then due on account of the production of ammonium nitrate in said plant, and the United States shall thereafter continue to pay during the period set forth in Article IV hereof to the agent for the ammonium nitrate produced therein one-quarter of one cent (\$.0025) per pound for all ammonium nitrate produced in said plant in any fiscal year of the United States until such date in said year as the amount produced at said plant, together with that produced by the other plants referred to herein, shall equal one hundred and ten thousand (110,000) tons; and as to the amount produced in said plant in said fiscal year, if any there be, after the said one hundred and ten thousand (110,000) tons of ammonium nitrate have been produced as aforesaid, the United States shall pay the agent one-eighth of one cent (\$.00125) per pound. The aggregate payments to the agent under this paragraph (2) on account of plants as to which this contract may have been terminated as aforesaid, shall not exceed five hundred and fifty thousand dollars (\$550,000) in any said fiscal year. Wherever the designation ammonium nitrate is used in this paragraph (2), it shall be deemed to include other products, described in paragraph numbered 2 in Article XI hereof, if any there be, produced in the plants described herein, but the fees due on said other products shall be calculated and determined according to the provisions of said paragraph (2) of Article XI hereof.

Provided, however, and it is understood and agreed, that this contract shall not be terminated as to any plant prior to June 1, 1921, or so long as the United States shall remain in the present war, except for the permanent cessation of all activities of the United States in connection with said plant, unless the agent exhibits such default or negligence as respects such plant as to require that the United States in its best interests should directly construct and operate said plant.

In the event of the termination of this contract as to any plant or plants aforesaid, the agent agrees to cooperate with the United States and to give to it its good offices and such assistance as the United States may from time to time request, in making the planning, construction, equipment, and operation of such plants successful and economical in all respects.

ARTICLE XVIII.

Right of United States to discontinue.—Nothing in this contract contained shall be deemed to prevent the United States from at any time discontinuing the construction or operation of any or all of the said plants, and in the event of such discontinuance the United States shall be under no liability to the agent for any payments as respects such plant or plants beyond those in this agreement specified. In the event that construction or operation is resumed at any of said plants at which construction or operation has been discontinued, the provisions of this contract shall govern the rights and obligations of the parties with respect to any such plant to the same effect as though the construction or operation thereof had not been discontinued.

ARTICLE XIX.

Sale of plants.—If upon cessation of this war or for any other reason the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time, not to exceed six months after receipt of written notice, stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made) to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party.

ARTICLE XX.

Bond.—The agent shall furnish to the United States within 20 days after the execution of this agreement a bond in the sum of five hundred thousand (\$500,000) dollars, conditioned upon the full and faithful performance by the agent of all terms, covenants, and conditions of that part of this agreement providing for the construction of said plants. The surety on said bond and the form thereof shall be satisfactory to the contracting officer. Unless such bond is furnished within said time limit this agreement may, at the option of the contracting officer, be canceled.

ARTICLE XXI.

Contract nonassignable.—This contract shall not, nor shall any right to receive payment or any other interest therein, be transferred or assigned by the agent to any person, firm, or corporation without the written consent of the Secretary of War.

Disputes.—Except as this contract shall otherwise provide, any doubts or disputes which may arise as to the meaning of anything in this contract shall be referred to the Chief of Ordnance for determination. If, however, the agent shall feel aggrieved at any decision of the Chief of Ordnance upon such reference, he shall have the right to submit the same to the Secretary of War.

Persons not to benefit.—No Member of or Delegate to Congress or Resident Commissioner, nor any person belonging to or employed in the military service of the United States is or shall be admitted to any share or part of this contract, or to any benefit that may arise therefrom, but this article shall not apply to this contract so far as it may be within the operation or exception of section 116 of the act of Congress approved March 4, 1909 (35 Stats., 1109).

Prison labor.—No persons shall be employed in the performance of this contract who are undergoing sentences of imprisonment at hard labor which have been imposed by the courts of the several States, Territories, or municipalities having criminal jurisdiction.

ARTICLE XXII.

Service of notices.—Any notice addressed to the agent at 511 Fifth Avenue, New York, N. Y., or at such other address as the agent shall by notice in writing advise the contracting officer, and either there delivered or deposited in a postpaid wrapper in any post-office box regularly maintained by the United States, shall be deemed to have been served upon the agent. Nothing herein contained shall preclude service of notices upon the agent by delivery thereof to any of its corporate officers in person.

ARTICLE XXIII.

Prior agreement superseded.—This agreement shall supersede the agreement of November 16, 1917, between Air Nitrates Corporation and the United States by which Air Nitrates Corporation is authorized to act as agent of the United States in the construction and operation of the Muscle Shoals plant hereinbefore referred to.

Provided, however, that such supersession shall not affect any of the rights or obligations of the parties hereto which have accrued or become fixed under said agreement of November 16, 1917, prior to the date hereof, except in so far as it is clearly intended by these presents that such rights or obligations shall be affected, whether through extinguishment, the substitution of others therefor, or otherwise.

Provided, also, that such supersession shall not in any way affect any of the subcontracts, obligations, or commitments which the Air Nitrates Corporation has heretofore in good faith entered into, made, or incurred under said agreement of the 16th of November, 1917.

ARTICLE XXIV.

New contract for deficiency in appropriations.—In the event that the existing appropriations applicable to the purposes of this agreement shall be inadequate, the United States shall have the right to execute and deliver, and the agent shall thereupon also execute and deliver, a new contract having the same terms and conditions as are contained herein.

ARTICLE XXV.

Definitions.—Wherever in this contract the words hereinafter enumerated are used they shall mean what is set opposite them:

Agent.—The party of the first part and its duly authorized representatives, successors, and assigns.

Chief of Ordnance.—The Chief of Ordnance, the Acting Chief of Ordnance, or any duly authorized representative of either.

Contracting officer.—The contracting officer executing this contract, his successor or successors, his or their duly authorized agent or agents, and anyone from time to time designated by the Chief of Ordnance to act as contracting officer.

Ton.—Two thousand (2,000) pounds.

Fiscal year of the United States.—The period from July 1st in any year to June 30th in the following year, both dates inclusive.

In witness whereof, the parties hereto have caused these presents to be executed and delivered, in triplicate, at Washington, D. C., the day and year first above written.

SCHEDULE A.

ITEMS OF COST REFERRED TO IN ARTICLE XII.

(a) All the land, including gravel pits, quarries, and coal mines, labor, material, machinery, fixtures, equipment, apparatus, appurtenances, tools not owned by the workmen, supplies and equipment necessary for either temporary or permanent use for the construction and operation of the plants, including the opening up and operation of gravel pits, quarries, and coal mines.

(b) Rental for construction plants and for the main and branch offices, and for furnishings and equipment for such offices.

(c) Loading and unloading construction plant, the transportation thereof, including transportation to and from the place or places where it is to be used in connection with said work, the installation and dismantling thereof and ordinary repairs and replacements during its use in the said work.

(d) Transportation and expenses, including transportation tax to and from the work of the necessary field and office forces, procuring labor, and expediting the production and transportation of material and equipment. All freight charges on equipment, furnishings, material, and supplies, including transportation tax thereon.

(e) Salaries of managers, engineers, superintendents, timekeepers, accountants, clerks, foremen, and other employees at the main and field offices of the agent in connection with said work, salaries of the executive officers of the agent except such as shall be placed at the disposal of the agent by the American Cyanamid Company and set forth in said contract market Exhibit 1.

(f) Buildings, houses, warehouses, hospitals, infirmaries, stores, commissaries, and structures, and the equipment required therefor and furnishings and equipment required for main and field offices, and the cost of maintaining and operating the same, and including such minor expenses as telegrams, telephone service, expressage, postage, etc.

(g) Buildings of different grades, warehouses, local power plant, structures, plant machinery, railway and trolley tracks, locomotives, cars, roundhouses, roadways, grading and sewerage, water and lighting systems, and fixtures.

(h) All bonds required by this agreement and all bonds necessary or proper, fire, liability, and other insurance, and all losses and expenses not compensated by insurance which have been actually sustained by the agent in connection with said work. Such losses and expenses, when incurred by the agent in connection with damage to third persons resulting from the work or due to the agent's fault or neglect, shall be included in the cost of the work, but not for the purpose of determining the agent's fee; but such losses and expenses when incurred by the agent in connection with constructing and replacing any of the work destroyed or damaged shall be included in the cost of the work for all purposes hereunder.

(i) Permit fees, royalties, and other similar items of expense incidental to the execution of this agreement.

(j) Transportation, including all transportation tax, traveling and hotel expenses, and telephone, telegraph, mail, and express, expenses of officers, engineers, and other employees of the agent as are actually incurred in connection with this work.

(k) Amounts paid to contractors or subcontractors and sums paid by the United States upon contracts made with any person at the request of the agent, and the cost of all materials furnished by the United States.

(l) All manner of expense of the agent in creating and constructing the plants and their equipment, including administration, superintendence, engineering, materials, labor, freight, transportation tax, power, heat, light, rentals, insurance, liabilities, losses not covered by insurance, and all overhead, general, and legal cost and expense, and including all other items of expenditure made by the agent not properly chargeable to manufacturing.

(m) In addition thereto further allowances, if any there be, of cost as from time to time may be made by the contracting officer.

EXHIBIT I.

LICENSE AGREEMENT.

This agreement entered into this 8th day of June, 1918, between American Cyanamid Company, a corporation organized and existing under and pursuant to the laws of the State of Maine, of the first part, hereinafter called the licensor, and the United States of America, hereinafter called the licensee, by Samuel McRoberts, colonel, Ordnance Department, National Army, hereinafter called the contracting officer, acting by and under the authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, of the second part.

Witnesseth:

Whereas the licensee has entered into an agreement of even date herewith with Air Nitrates Corporation, a corporation organized and existing under and pursuant to the laws of the State of New York, by which agreement said corporation has agreed as agent of the licensee to construct and operate for the licensee plants for the manufacture of ammonium nitrate, all for the reasons and as is more particularly set forth in said agreement; and

Whereas the licensor possesses certain United States letters patent and is the owner of exclusive licenses under certain other letters patent of the United States, all as set forth in Schedule A hereto annexed and made a part hereof, covering certain processes and methods involved in the manufacture of lime nitrogen (calcium cyanamid), its conversion to ammonia gas and the oxidation of ammonia to weak nitric acid, and may grant licenses thereunder; and

Whereas the licensor, to enable said Air Nitrates Corporation to carry out said agreement, will place at the disposal of said corporation its experiences, studies, records, designs, plans, and certain of its executive and technical force, all as hereafter set forth; and

Whereas the licensor entered into a contract with the licensee under date of November 18, 1917, which contract was executed on behalf of the licensee

by J. W. Joyes, colonel, Ordnance Department, United States Army, contracting officer, with respect to the license hereinafter granted:

Now, therefore, in consideration of the mutual agreements herein contained, the said parties have agreed, and by these presents do agree, to and with each other as follows, to wit:

ARTICLE I.

License to use certain patented processes, etc.—The licensor, for use and application exclusively by the United States Government of the aforesaid agent at said plants, has given, granted, assigned, and does hereby give, grant, and assign to the licensee the right, license, and privilege to use any and all of the processes, methods, and designs covered by letters patent of the United States and involved in the manufacture of lime nitrogen (calcium cyanamid), its conversion to ammonia gas and the oxidation of the ammonia to weak nitric acid, which said letters patent are described in Schedule A, annexed hereto and made a part hereof, for and during the time the United States shall remain in the present war, and in any event until June 1, 1921, together with all improvements therein and all patents or other rights relating thereto which the licensor may hereafter make or secure during said period.

The licensor agrees that nothing contained in this agreement shall restrict the licensee to the use only of such rights and patents, as the licensor now possesses or may hereafter possess, and the licensee has the privilege of using the processes, rights, and patents of persons other than the licensor, either in conjunction with the processes, rights, and patents of the licensor or independent thereof if in the judgment of the contracting officer such action is required to obtain the best results of operation.

ARTICLE II.

Use of licensor's experiences, records, etc.—The licensor agrees to place at the disposal of the said Air Nitrates Corporation and the contracting officer, for the production of ammonium nitrate and the construction and operation of the plants referred to in the agreement between the licensee and the Air Nitrates Corporation above referred to, all the experiences, records, studies, designs, and plans of the licensor bearing on and pertaining to the processes necessary or incidental to the manufacture of ammonium nitrate now owned by the licensor and agrees that the said Air Nitrates Corporation and its representatives and the contracting officer shall have access to said experiences, records, studies, designs, and plans at all reasonable hours, and shall be permitted to make copies thereof and excerpts therefrom. The licensor further agrees to divulge to the said Air Nitrates Corporation and the contracting officer for the sole purpose of this agreement and said agreement between Air Nitrates Corporation and said licensee, all of the secret processes which, combined with the processes covered by the aforesaid letters patent, go to make up the system of manufacture of ammonium nitrate.

ARTICLE III.

Use of licensor's plants for training purposes.—The licensor agrees to place at the disposal of the said Air Nitrates Corporation and the contracting officer all of the plants now owned or operated by the licensor for the purpose of training of superintendents, foremen, chief operatives, and the like for the proposed plants to be constructed and operated by the Air Nitrates Corporation, and further agrees that the said corporation and its representatives and the contracting officer shall have access to said plants at all reasonable hours for the purpose above referred to.

ARTICLE IV.

Services of certain of licensor's technical men.—The licensor agrees to place at the disposal of the said Air Nitrates Corporation for the construction and operation of the plants under the contract above referred to the following members of the executive and technical forces of the licensor as from time to time constituted, namely, president, vice president and general manager, engineering assistant to general manager, superintendent of manufacturing, sales and traffic manager, chief technologist, chief engineer, assistant engineer, and, in addition

thereto, in connection with the operation of said plants, two principal works managers; and further agrees to pay the entire salaries of such persons during the terms of said agreement between the licensee and said corporation, and agrees that at all times it will maintain an executive and technical force which shall be familiar with the operation of the processes involved in the manufacture of ammonium nitrate.

ARTICLE V.

Benefit hereunder to accrue to Air Nitrates Corporation.—The licensor agrees that all of the benefits to accrue to the licensee by the terms of this agreement may be at any time assigned to the Air Nitrates Corporation and shall in any event accrue to the Air Nitrates Corporation, but only for the purposes of said agreement between the United States and the Air Nitrates Corporation. The licensor shall have the right to grant, and at the written request of the licensee will grant, a license in all respects similar to the license herein granted to the Air Nitrates Corporation, to enable said corporation to carry out its agreement with the United States of even date herewith.

ARTICLE VI.

Royalty.—In consideration of the granting of the license provided for in Article I hereof and of the other conditions to be performed by the licensor, the licensee agrees to pay the licensor during the term thereof specified in said article, as royalty, an amount equivalent to six mills (\$.006) per pound of all nitrogen fixed as lime nitrogen manufactured at the plants hereinbefore described in the contract of even date herewith between the United States and the Air Nitrates Corporation, and to which reference has hereinbefore been made, up to and including the first ninety-one million seven hundred thousand (91,700,000) pounds of such nitrogen so fixed in any fiscal year of the United States, and in addition thereto three mills (\$.003) per pound of all nitrogen fixed as lime nitrogen in any said fiscal year in excess of the said ninety-one million seven hundred thousand (91,700,000) pounds of nitrogen, it being further understood and agreed that no part of such royalty shall directly or indirectly inure to the benefit of an alien enemy of the United States except as may appear upon a disclosure of stock lists made pursuant to law. Payment for royalties shall be made each month as early in the month as practicable upon the presentation of satisfactory evidence showing the production during the preceding month of nitrogen fixed as lime nitrogen at the plants hereinbefore referred to.

ARTICLE VII.

Acknowledgment of ownership of patents, processes, etc.—It is understood and agreed that so far as the right, license, and privilege to use any and all of the patents, processes, methods, and designs, as described in Schedule A hereto annexed, is given, granted, and assigned hereby, the Government and its agents and other parties claiming under this license, do and they shall acknowledge and recognize the American Cyanamid Company as the sole owner of said patents, processes, methods, and designs and of the exclusive right to use the same, subject only to the rights granted to the United States by this license and any license granted said Air Nitrates Corporation, and the United States shall, so far as practicable, exclude the public from all works in which said process shall be employed, and generally shall use all reasonable means to preserve said rights unimpaired.

ARTICLE VIII.

Indemnity against infringement.—To the extent only that the licensor shall have received cash hereunder the licensor agrees to defend and save harmless the Air Nitrates Corporation and the United States from all suits and claims for infringement by reason of the use by either of them of its patents for the making of cyanamid and the making of ammonia gas, which said patents are described in Schedule B hereto annexed and made a part hereof, and pay any judgments which may be obtained therefor against the licensee or the said Air Nitrates Corporation, but only to the extent aforesaid.

The licensor will defend and save harmless the licensee and the Air Nitrates Corporation from any action or suit brought by any person in privity with it

in which the right of said licensee or said corporation to use said patents described in said Schedule A shall be attacked: *Provided, however*, That the United States shall promptly give the licensor written notice of any and all such suits, actions, or claims described in this article, and tender the defense thereof to the licensor.

ARTICLE IX.

Termination of agreement as to any plant.—In the event that the United States shall terminate this agreement as to any one or more of the plants to be constructed by the Air Nitrates Corporation under said agreement of even date herewith and pursuant to the provisions in that behalf therein contained, all of the rights and privileges herein inuring to the said Air Nitrates Corporation shall inure in respect of the plant or plants as to which said agreement is terminated, to the benefit of the United States, but only until June 1, 1921, and so long thereafter as the United States shall remain in the present war.

ARTICLE X.

License to use patents, processes, etc., after 1921 or the end of the war; arbitration of royalties thereunder.—The licensor hereby gives and grants to the licensee, in addition, for use and application exclusively by the licensee in the operation of the aforesaid plants, the right, license, and privileges to use any and all of the patents, processes, methods, and designs embraced in the license hereinbefore granted to the licensee by Article I hereof, from and after the 1st day of June, 1921, or the date upon which the United States shall cease to be in the present war (whichever date shall last occur) and until the expiration of the United States patents covering the same, upon the following terms, to wit:

The licensee shall pay monthly to the licensor for such additional license under this article a royalty, unless and until changed by the arbitration hereinafter provided, of one and one-half cents (\$0.015) per pound of nitrogen content in any and all products manufactured by the licensee at each and every of said plants under and by the use of any of the patents, processes, methods, or designs embraced in the said additional license.

In the event that either the licensor or the licensee shall be dissatisfied with the aforesaid royalty in this article defined, either or both may, within the first three years of the period fixed for the duration of said additional license, demand that the amount of the royalty to be paid hereunder shall be determined and fixed by arbitration. Such demand shall be made in writing and shall be delivered to the other party hereto, together with the name and address of the arbitrator chosen by the party demanding the arbitration, and the other party hereto shall, within fifteen (15) days thereafter, choose a second arbitrator and notify the party demanding the arbitration of its choice and give the name and address of such arbitrator. The two arbitrators so chosen shall, within fifteen (15) days after being notified by either party that the second arbitrator has been chosen, choose a third arbitrator. The arbitrators, when chosen, shall promptly fix a time and place for the hearing, and then and there the parties hereto shall attend and present their respective proofs and arguments. The hearing may from time to time be adjourned by the arbitrators by a writing notifying the parties of the time and place to which such adjournment is made.

The arbitrators shall with all reasonable speed ascertain and determine what, in their opinion, under all the circumstances, are adequate and reasonable royalties to be paid under this article and the date, not earlier than that of the demand for such arbitration, from which the said award shall be effective. They shall notify the parties in writing of the royalties so ascertained and determined and state the amount, if any, that either party may then owe to the other with respect to royalties under the terms of the award. The said award when signed by any two of the arbitrators shall be final and conclusive upon all parties concerned.

In the event that either the second or the third arbitrator shall not be chosen in the manner and within the time hereinabove fixed, any United States district judge for the southern district of the State of New York, upon the application of either party, may choose an arbitrator or arbitrators, as the case may be, to act.

No terms with respect to royalty contained in this agreement or in the said agreement of November 16, 1917, or in any agreement between said Air Nitrates Corporation and the United States, or in any negotiations or proposals between

the said several parties looking to the making of the said agreements or relating to the subject matter thereof shall be utilized by either party in said arbitration or taken into consideration by the arbitrators in making their award.

The costs and expenses of the arbitrators and of the arbitration shall be ascertained by the arbitrators and shall be borne equally by the parties hereto.

The licensee may transfer to the purchaser of any one or more of said plants the right to avail itself of the license in this article granted in the operation of the plant or plants so purchased, if said purchaser, as a term of said purchase, expressly covenants to undertake, observe, and perform all the terms of this article, including the payment of royalties and the findings of the said arbitrators, if any, as respects the plant or plants so purchased.

ARTICLE XI.

Cessation of royalties.—If the use of the inventions of the aforesaid letters patent and the methods, apparatus, and processes owned by the licensor and disclosed hereunder to the Air Nitrates Corporation and the licensee shall be discontinued by the Air Nitrates Corporation or by the licensee or its assigns, the obligation for the payment of royalties hereunder shall cease as to those of said parties who shall have so discontinued such use.

ARTICLE XII.

Contract not assignable.—This contract shall not, nor shall any right to receive payment, or any other interest herein, be transferred or assigned by the licensor to any persons, firms, or corporations.

ARTICLE XIII.

Persons not to benefit.—No Member of or Delegate to Congress, or Resident Commissioner, is, or shall be, admitted to any share or part of this contract or to any benefit that may arise therefrom, but this article shall not apply to this contract so far as it may be within the operation or exception of section 116 of the act of Congress approved March 4, 1909 (35 Stat., 1109).

ARTICLE XIV.

Disputes.—Except as this contract shall otherwise provide, any doubts or disputes which may arise as to the meaning of anything in this contract shall be referred to the Chief of Ordnance for determination. If, however, the licensor shall feel aggrieved at any decision of the Chief of Ordnance upon such reference, he shall have the right to submit the same to the Secretary of War.

ARTICLE XV.

Definitions.—Whenever in this contract the words hereinafter enumerated are used they shall mean what is set opposite them.

Licensor.—The party of the first part and its legal representatives, successors, and assigns.

Chief of Ordnance.—The Chief of Ordnance, the Acting Chief of Ordnance, or any duly authorized representative of either.

Contracting officer.—The contracting officer executing this contract, his successor or successors, his or their duly authorized agent or agents, and anyone from time to time designated by the Chief of Ordnance to act as contracting officer.

ARTICLE XVI.

New contract for deficiency in appropriations.—This agreement shall be binding upon the licensor for the term of the license, but in the event of the existing appropriations applicable to the purposes of this contract being inadequate, the licensee shall have the right to execute and deliver, and the licensor shall thereupon also execute and deliver, a new contract having the same terms and conditions as are contained herein.

ARTICLE XVII.

Previous agreement superseded.—This agreement shall supersede the said agreement of November 16, 1917, between the licensor and the licensee.

In witness whereof, the parties hereto have caused this contract to be executed in triplicate, at Washington, D. C., the day and year first above written.

SCHEDULE A.

[Being a part of license agreement hereto annexed.]

LIST OF PATENTS COVERING PROCESSES AND PRODUCTS OF THE PROPOSED GOVERNMENT NITRATE PLANTS.

- U. S. patent 776314. "Process of making ammonia," November 29, 1904.
- U. S. patent 785161. "Process of making nitrogen compounds," March 21, 1905.
- U. S. patent 12762. "Process of making nitrogen compounds," March 10, 1908.
- U. S. patent 996011. "Method of making nitrogen compounds," June 20, 1911.
- U. S. patent 999071. "Apparatus for producing calcium cyanamid," July 25, 1911.
- U. S. patent 1009705. "Process of making calcium cyanamid," November 21, 1911.
- U. S. patent 987674. "Process of producing nitrogen compounds," March 21, 1911.
- U. S. patent 1006927. "Method of producing nitrogen compounds from carbids," October 24, 1911.
- U. S. patent 1010404. "Apparatus for producing nitrogen compounds from carbids," November 28, 1911.
- U. S. patent 1100582. "Process of crushing and grinding calcium carbide," June 16, 1914.
- U. S. patent 1100539. "Cyclical process of fixing atmospheric nitrogen," June 16, 1914.
- U. S. patent 1103060. "Method and means for fixing nitrogen," July 14, 1914.
- U. S. patent 1103061. "Process and apparatus of fixing atmospheric nitrogen," July 14, 1914.
- U. S. patent 1103062. "Method of and apparatus for fixing nitrogen," July 14, 1914.
- U. S. patent 1149653. "Process of making ammonia from calcium cyanamid," August 10, 1915.

COPY OF CONTRACT NO. T-69, ARMY NO. 12835, DATED DECEMBER 1, 1917, BETWEEN THE UNITED STATES AND ALABAMA POWER CO. FOR CONSTRUCTION OF GENERATING STATION, SUBSTATIONS, AND TRANSMISSION LINES, AND FOR SUPPLY OF ELECTRICAL ENERGY TO UNITED STATES NITRATE PLANTS AT MUSCLE SHOALS AND SHEFFIELD, ALA.

[Office of the Chief of Ordnance, Nitrate Division, Washington, D. C.]

This agreement, dated December 1, 1917, between Alabama Power Co., a corporation organized and existing under the laws of the State of Alabama (hereinafter called the "contractor"), party of the first part, and the United States of America, by William Williams, lieutenant colonel, Ordnance Department, United States Army, acting as contracting officer by authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, party of the second part, witnesseth:

Whereas the United States is constructing at or near Sheffield, Alabama, certain plants for the production of ammonium nitrate and other chemicals and will require electric energy for their operation and for other purposes; and

Whereas the contractor owns and operates an electric generating transmitting and distributing system in the State of Alabama which includes in general (1) a hydroelectric plant on the Coosa River with an installed capacity of 67,500 K. V. A.; (2) a transmission network (including a 110,000-volt system) connecting the aforesaid plant with various other plants and substations; (3) a steam reserve generating plant, hereinafter referred to as the Warrior Station, situated on the Black Warrior River at the junction of said river with Bakers Creek, Walker County, and having an installed capacity of 25,000 K. V. A.; (4) certain rights of way extending approximately twenty miles from said Warrior Station toward Sheffield, Ala., and available for the construction thereon of a portion of the transmission line hereinafter referred to; and

Whereas the contractor represents that it now owns and controls at said Warrior Station things and facilities which will be useful in connection with the installation, construction, and operation of the Warrior extension and Warrior

substation hereinafter referred to, including (a) adequate circulating water intake and discharge facilities with gates, screens, canals, and tunnels; (b) partially constructed building and apparatus foundations; (c) camps, roads, tracks, and docks; (d) plans and specifications; (e) a staff for engineering, construction and operation; (f) ash-handling facilities and ash-dumping spaces; and (g) other facilities in existence at or about said station at the commencement of work under this contract which will be useful in the maintenance and operation of said Warrior extension as a plant for the generation of electric energy; and

Whereas the existing state of war creates a national emergency and the United States requires the performance of the work and the supply of electric energy herein described at the earliest date possible:

Now, therefore, in consideration of the mutual agreements herein contained, the said parties have agreed and by these presents do agree with each other as follows:

ARTICLE I.

The line from contractor's system to Warrior substation.—The contractor shall at its own cost and expense furnish the labor, materials, tools, machinery, equipment, facilities, and supplies and do all things necessary for installing between its said 110,000-volt system and the Warrior substation mentioned in Article II hereof, a tie line and other facilities of capacity and character sufficient for transmitting continuously 30,000 K. W. of 3-phase, 60-cycle, alternating current at 110,000 volts, to said Warrior substation and through it to the transmission lines referred to in Article III.

ARTICLE II.

New facilities at Warrior Station.—The contractor shall, at the expense of the United States, prepare and submit to the contracting officer for approval, general plans and specifications for additional plant and other facilities at or near its Warrior Station as follows:

(a) *Warrior extension.*—For a new power station building with a 33,333 K. V. A. steam turbo generator with boilers and switchboard and for other facilities as more fully described in schedule A hereto annexed and made a part hereof. The aggregate of the new facilities to be erected or installed under this subdivision, including all movable property thereto pertaining, are hereinafter referred to as the "Warrior extension."

(b) *Warrior substation.*—For a new substation and substation apparatus, as more fully described in schedule B hereto annexed and made a part hereof. The aggregate of all new facilities to be erected or installed under this subdivision, including all movable property thereto pertaining, are hereinafter referred to as the "Warrior substation."

Upon the approval by the contracting officer of said plans and specifications for the Warrior extension and the Warrior substation or any part thereof the contractor shall as the agent for and at the expense of the United States furnish labor, materials, tools, machinery, equipment, facilities, and supplies, and do all things necessary for the construction and completion of all buildings and structures for the installation of all equipment and for the performance of all other work described in the plans and specifications so approved, as they may be amplified by detailed plans and specifications submitted to and approved by the local representative of the contracting officer.

ARTICLE III.

Transmission lines.—(1) The contractor shall, subject to the approval of the contracting officer, but at the sole expense of the contractor, select, survey, and acquire the title to the necessary right of way of approximately one hundred feet width to provide, in conjunction with its said present right of way of approximately twenty miles length and one hundred feet width, a continuous and reasonably direct right of way for a transmission line from said Warrior substation to a point (to be designated by the Chief of Ordnance) on the land of the United States on which is located its Muscle Shoals nitrate plant and substation.

(2) The contractor shall, at the expense of the United States, prepare and submit to the contracting officer for approval general plans and specifications

for a transmission line of the general character described in Schedule C hereto annexed and made a part hereof, extending from said Warrior substation over said right of way to said land of the United States, thence over said land, as determined by the contracting officer, to the Muscle Shoals substation referred to in Article IV. Upon the approval by the contracting officer of said plans and specifications or any part thereof, the contractor shall as the agent for and at the expense of the United States furnish all the labor, materials, tools, machinery, equipment, facilities, and supplies, and do all things necessary to clear so much of said right of way and so much of the land of the United States along the line which may be indicated by the contracting officer as may be necessary and to construct thereon a transmission line and appurtenances in accordance with the plans and specifications so approved, as they may be amplified by detailed plans and specifications submitted by the contractor to and approved by the local representative of the contracting officer. Such transmission line and appurtenances are hereinafter referred to as the transmission line.

(3) The contractor shall, at the expense of the United States, prepare and submit to the contracting officer for approval general plans and specifications for a branch transmission line of the general character of the transmission line, extending from a point on the transmission line at or near Russellville to the limestone quarry of the United States, a distance of approximately 3,000 feet. Such branch transmission line and appurtenances are hereinafter referred to as the quarry branch line. Upon the approval by the contracting officer of such plans and specifications the contractor shall as the agent for and at the expense of the United States likewise construct the quarry branch line on a right of way to be provided by and at the expense of the United States.

(4) The contractor shall, until the termination of the war, on written request by the contracting officer, construct at the expense of the United States any other branch transmission lines required by the United States in connection with the operation of said nitrate plants, on a right of way to be provided by and at the expense of the United States. The United States shall pay the contractor as compensation for its services under this subdivision such fee as may be allowed by the contracting officer.

(5) The contractor may construct, operate, and maintain only such other transmission lines and appurtenances on its said right of way as in the opinion of the Chief of Ordnance will not in any way interfere with the construction and operation by the United States of the transmission line or of an additional 110,000 volt transmission line and appurtenances, if the United States desires to construct such, paralleling the transmission line. The contractor shall not use the poles or wires erected nor the way cleared at the expense of the United States without the written authority of the Chief of Ordnance.

ARTICLE IV.

Muscle Shoals substation.—The contractor shall, at the expense of the United States, prepare and submit to the contracting officer for approval, general plans and specifications for a substation and substation apparatus at Muscle Shoals, as described in Schedule D hereto annexed and made a part hereof. Said substation and substation apparatus are hereinafter referred to as the "Muscle Shoals substation."

Upon the approval by the contracting officer of said plans and specifications or any part thereof, the contractor shall, as the agent for and at the expense of the United States, furnish all labor, materials, tools, machinery, equipment, facilities, and supplies and do all things necessary for the construction of all buildings and structures, for the installation of all equipment and for the performance of all other work described in the plans and specifications so approved, and as amplified by plans and specifications submitted by the contractor to and approved by the local representative of the contracting officer.

ARTICLE IV A.

Drifton extension railroad.—The contractor shall prepare and submit to the contracting officer for approval general plans and specifications for the extension of the Drifton branch of the Southern Railway from the terminus of said branch to the Warrior extension, a distance of 8,000 feet, more or less. Upon the approval by the contracting officer of said plans and specifications or any part thereof, the contractor shall furnish all the labor, materials, tools, machinery, equipment, facilities, and supplies, and do all things necessary for the construction of said Drifton extension railroad, and of all other work de-

scribed in the plans and specifications so approved, and as amplified by plans and specifications submitted by the contractor to and approved by the local representative of the contracting officer. The construction, operation, and maintenance of said Drifton extension railroad shall be on the terms and conditions set forth in Schedule E hereto annexed and made a part hereof. The parties hereto shall, without unnecessary delay, execute a supplemental contract in relation to the subject matter of this article, which shall embody such further details and contain such reasonable clauses as the contracting officer shall deem necessary.

ARTICLE V.

Changes in drawings and specifications.—The contracting officer may, from time to time, by written instructions, make changes in the drawings and specifications prepared by the contractor and require additional work or direct the omission of work previously ordered, and the provisions of this contract shall apply to all such changes, modifications, and additions with the same effect as if they were embodied in the original drawings and specifications; but the contractor shall not be held responsible for delays resulting from such changes or delays in giving approvals. Changes, modifications, and additions affecting the contractor's property or system to be mutually agreeable; provided that the submission by the contractor for approval and the approval by the contracting officer of any such change, modification, or addition shall be evidence of such agreement.

ARTICLE VI.

Subcontracts.—The contractor may, with the written approval of the contracting officer, perform any part of the construction and equipment work under this contract through the means of subcontracts, but such subcontracts shall contain a reference to this contract and an express provision that they are subject to all provisions hereof, and that with the consent of the United States they may be assigned by the contractor herein to the United States or its nominee. Nothing in this article contained, nor the approval of said subcontracts, shall relieve the contractor of any of its obligations hereunder. A copy of every subcontract shall be delivered to the contracting officer promptly upon the execution thereof.

ARTICLE VII.

Use by United States of contractor's lands.—(1) The contractor agrees during such period as the United States shall remain the owner of said Warrior extension and substation and until their acquisition by the contractor or their removal by the United States (a) that the United States shall have the right to occupy for the purposes of this contract all parcels of land upon which any building or structure of whatever nature (including lines, pipes, poles, apparatus, or connections), may or shall be erected under this contract for or at the expense of the United States in connection with the Warrior extension or Warrior substation; (b) that the United States shall have rights of ingress and egress for the purpose of this contract to and from all such parcels of land and from one to the other with the right to make all necessary connections across any of such lands, to lay, relay, maintain, and repair conduits and pipes and to erect poles, and in general to do all acts and things necessary to enable the United States to make the most convenient use of such buildings, structures, machinery, intake and discharge facilities and connections in carrying out this contract; in such manner, however, as not to interfere with the operation of the contractor's Warrior station without its previous consent.

(2) The contractor also agrees that the United States may erect and maintain transmission lines on the contractor's said right of way from the Warrior extension to the land of the United States on which is located its said Muscle Shoals nitrate plant during such period as the United States shall remain the owner of the transmission line.

Nothing in this article contained, however, shall prevent the contractor from utilizing in such manner as it may desire any of its lands not occupied by the United States on December 1, 1918, subject, however, to the provisions of subdivision (5) of Article III.

ARTICLE VIII.

Maintenance of Warrior extension, substations, and the transmission line—Insurance.—The contractor shall at its own expense, upon the termination of the period of preliminary operation mentioned in Article XIV and during the period described in the first paragraph of Article VII, maintain the Warrior extension and the Warrior substation, including all equipment and appurtenances, in first-class repair and suitable condition for efficient and continuous operation.

The contractor shall at its own expense, upon the termination of said period of preliminary operation and during the period described in the second paragraph of Article VII hereof, maintain the transmission line and the quarry branch line in good repair and suitable condition for efficient and continuous operation. The contractor shall upon written request by the contracting officer cause the Warrior extension, said substations, and said transmission lines to be duly policed, but at the expense of the United States. Upon failure of the contractor after reasonable notice from the contracting officer to maintain said properties in repair as hereinabove provided, the United States shall make such repairs and charge the cost thereof to the contractor.

The contractor shall, upon the termination of said period of preliminary operation, insure and keep insured all of said property of a character which it is customary to insure, against loss or damage by fire and any other casualty customarily covered by insurance; loss or damage to be payable to the United States as its interest may appear; all policies to be subject to the approval of the contracting officer. The cost of such insurance shall be borne by the contractor. In the event of damage to or the destruction of said Warrior extension or Warrior substation from whatever cause after the contractor begins to operate the same as a part of its system the contractor shall, at its own expense, promptly replace the property so damaged or destroyed. Insurance collected in respect of such damage or loss may be paid to the contractor, as the work of reconstruction progresses, in such amounts as the contracting officer deems proper. If any right of action or claim exists in favor of the United States as the beneficiary of such insurance or as the purchaser of any damaged or destroyed apparatus or property connected with said Warrior extension or Warrior substation, the contractor shall be entitled to the benefit of such right or claim for the purpose of reimbursing or protecting it in replacing property so damaged or destroyed; and the United States agrees either to assign such right or claim to the contractor or to pursue the same for the benefit of the contractor.

During the construction of the Warrior extension, the Warrior substation, and the transmission line, and until the contractor shall have commenced operation of the same as part of its system (but not thereafter) the United States shall bear all losses or accidents to person or property occurring in the course of the work.

ARTICLE IX.

Title to property paid for by United States.—The title to all property purchased, acquired, erected, or installed at the expense or for the account of the United States, including the Warrior extension, Warrior substation, Muscle Shoals substation, the transmission line, and the quarry branch line shall forthwith upon such purchase, acquisition, erection, or installment vest in the United States. All property of the United States shall, so far as practicable, be kept separate and apart from property belonging to the contractor and the contractor shall acquire no property right or interest therein. Such property shall at all times be considered personalty, which shall not be deemed to be so affixed to the real estate as to become a part thereof. It shall be plainly marked to denote ownership as the contracting officer may direct.

The contractor agrees to protect and save harmless the United States from any and all claims that may be made by or on behalf of any mortgagee, trustee, bondholder, or lienor to any building, structure, machinery, equipment, or other property of the United States that may, under the provisions of this contract, be placed upon any of the contractor's land which now is or hereafter shall be subject to a mortgage, lien, or deed of trust, including the first mortgage of the Alabama Power Co., dated March 1, 1916.

ARTICLE X.

Schedule of United States property.—(1) As soon as practicable a schedule of the property belonging to the United States under this contract shall be made in duplicate by the contractor and approved and identified by the parties hereto.

As additional property is acquired, at the expense of the United States, for use in connection with the Warrior extension, the Warrior substation, the Muscle Shoals substation, the transmission line, or the quarry branch line, a like schedule thereof shall be made, approved, and identified as aforesaid; and all property so acquired shall become a part of the Warrior extension, the Warrior substation, the Muscle Shoals substation, the transmission line, or the quarry branch line, as the case may be.

(2) In said schedule there shall be indicated the articles or apparatus and the value thereof which have been installed to replace those existing in the property of the contractor where such replacement was necessary to adapt the apparatus or system of the contractor to the requirements or apparatus of the United States.

ARTICLE XI.

Cost payable by United States.—The cost of the work mentioned in Article II, in subdivisions (2) and (3) of Article III, and in Article IV shall, upon approval or ratification of such cost by the contracting officer, be borne and paid by the United States. Included in the items of such costs are those listed in Schedule F hereto annexed and made a part hereof. The United States shall pay such cost in the manner following:

(a) It shall pay directly to laborers and material men all labor, materials, and supplies, the cost of which has been so approved or ratified, also all rent due the contractor under Schedule F in respect of any construction plant or office space of the contractor.

(b) It reserves the right to pay directly to common carriers any or all freight and express charges on materials, supplies, or machinery certified by the contracting officer as being for use under this contract.

(c) It shall reimburse the contractor for all costs and expenditures incurred and paid by the contractor upon the same being approved or ratified by the contracting officer.

The United States shall detail a sufficient number of disbursing officers for service on the work with power and funds to make prompt payment of all sums due upon this article.

ARTICLE XII.

Compensation by United States for use of contractor's lands and other facilities, and in lieu of overhead.—Upon the signing and delivery of this contract the United States shall pay to the contractor the sum of sixty thousand (60,000) dollars in full satisfaction (a) for all uses of contractor's lands mentioned in Article VII and for the use of the facilities owned or controlled by the contractor and referred to in the recitals to this contract; (b) for overhead expenses of the contractor.

ARTICLE XIII.

Contractor's fee.—As full compensation for the services of the contractor in all work of construction and equipment to be performed hereunder, including the work mentioned in Schedules A, B, C, and D, the United States shall pay to the contractor a fee equal to six per cent of the cost described in Article XI, except that no fee shall be paid in respect of the following:

(a) Plant or equipment furnished by the United States.

(b) Freight and express charges, other than charges for transportation of the contractor's construction plant, equipment for construction, and tools.

(c) Premiums on bonds, losses and expenses mentioned in subdivision (h) of Schedule F.

(d) Cost of reconstructing or replacing any damaged work, unless the fee thereon shall be authorized by the contracting officer under subdivision (f) of Schedule F.

The amount of said fee shall be computed by the contracting officer, and payments shall be made monthly, based upon the cost of disbursements of the preceding month. In determining said fee the payments by the United States described in Article XII shall not be included as a part of the cost of any of the work. The total of said fee shall not exceed two hundred and twenty-five thousand (225,000) dollars.

ARTICLE XIV.

Period of preliminary operation.—From such time as the Warrior extension, the Warrior substation, and the transmission line are, in the opinion of the contracting officer, ready for preliminary operation and until December 1, 1918,

or until such later date as the same are deemed by the Chief of Ordnance as complete and ready for use in the performance of this contract, the contractor shall operate the said properties at the expense of the United States, such expense to include all labor, coal, material, and supplies which may be used in the testing or operation of said properties, and also a fair proportion of the expense of the contractor's regular operating staff engaged in said work. Such expense shall be paid to the contractor monthly, but shall not be included in the cost of such properties for the purpose of determining their value.

During the period of preliminary operation all energy developed by the Warrior extension shall, to the extent that the United States shall require, be delivered to the transmission line and no charge shall be made therefor by the contractor. The equivalent of any energy generated during such period at the Warrior extension and used by the contractor for commercial purposes shall be recorded and returned to the United States by the contractor at the Warrior extension switchboard, either from its own system or from the Warrior extension after the contractor shall have commenced operations thereof as part of its system.

ARTICLE XV.

Operation of Warrior extension, of substations, and of transmission lines—Electric energy to be furnished.—Upon the termination of the period of preliminary operation mentioned in Article XIV, the contractor shall at its own expense operate said Warrior extension, Warrior substation, Muscle Shoals substation, the transmission line, and the quarry branch line as part of its system and shall maintain the same in readiness to supply and shall supply the demands of the United States and those of its successor in interest hereinafter referred to under this contract to the extent of the capacity of the Warrior extension at the time; provided, that all repairs, renewals, or replacements to and in the Muscle Shoals and quarry branch substations and their apparatus shall be made by the contractor at the expense of the United States. Nothing in this contract contained shall authorize the contractor, except with the written approval of the Chief of Ordnance, to transmit energy over said transmission lines otherwise than for the use of the United States or its said successor. But with such approval, and upon terms and conditions approved by the Chief of Ordnance, the contractor may transmit energy over said lines. All energy to be supplied by the contractor shall be in the form of three phase, 60 cycle, alternating current, at a pressure of approximately 110,000 volts. It shall be measured at the low tension switchboard of the Warrior substation and thence delivered to the transmission line at the Warrior substation to be transmitted to the Muscle Shoals substation and that of the quarry branch line, as may be required by the United States, and all at the expense of the contractor.

The contractor shall operate said properties in an efficient manner and do all things necessary or appropriate in and about such operation, including procurement of all labor and materials, except that the United States may at any time furnish the contractor with the necessary coal for the operation of the Warrior extension, subject, however, to the provisions of Article XVI. The contractor shall use its best efforts to maintain a reserve of coal adequate to insure a continuous supply of energy from the Warrior extension.

The manufacturers' rated capacity of the generating unit in the Warrior extension is 30,000 kw. when operated under the following conditions: Steam pressure, 200 pounds per square inch; superheat, 200 degrees F.; vacuum, 29"; and power factor, 90 per cent.

The contractor shall so maintain the operating conditions of the Warrior extension which are within its control, that, provided the power factor of the load of the United States at the Warrior extension is not less than 90 per cent, the United States shall receive from the Warrior extension a supply of electric energy at least equal to that which said unit is capable of producing under normal operating conditions.

The Warrior extension and Warrior substation are to be operated in parallel with the steam generating plant of the United States nitrate plant No. 2 at Muscle Shoals, and the contractor shall maintain at the Warrior extension and substation and the United States at its said steam generating plant such usual and proper operating conditions as to voltage and frequency as may be required to make such operation in parallel successful.

The contractor shall operate said properties and supply energy as aforesaid for the United States or its said successor for the period of ten (10) years from the date of this contract.

The United States shall upon request furnish the contractor from time to time such information as it may possess concerning its probable requirements for energy, in order that the contractor may make all necessary arrangements to supply the same in an efficient and economic manner.

Should the United States at any time during the war and within three years after its termination require more energy than the Warrior extension is capable of producing and delivering at such time, or should an emergency arise preventing the operation of the Warrior extension, then, in either event, the contractor shall supply energy to meet the requirements of the United States from its own system, provided it can do so without curtailing the service to any of its firm power customers existing on December 1, 1918, or operating the steam generating plant of the Birmingham Railway, Light & Power Co.; and provided further, that the requirements of the United States in respect to such energy shall, to the extent of the capacity of the Warrior extension, be met in preference to those of any customer of the contractor other than said firm power customers existing on December 1, 1918.

ARTICLE XVI.

Supply of coal by the United States.—All coal supplied to the contractor by the United States shall be so supplied at prices not in excess of those at which coal can be obtained by the contractor delivered at the Warrior extension, making due allowance for the difference, if any, in the quality of the coal from that specified in Article XX and in accordance with the procedure therein indicated. In exercising this option the United States shall supply coal in such quantity, at such a rate, and in such a manner as not to put the contractor to any additional expense, and so as not to interfere with the continuous operation of the Warrior extension at its capacity, with a sufficient supply on hand for reserve: provided that the contractor may use coal for the purchase or supply of which it has previously and in good faith become definitely committed in preference to coal to be supplied by the United States. The price of any coal supplied by the United States shall be deducted from any payments due the contractor for energy as such coal is from time to time used in the generation of energy.

ARTICLE XVII.

Payments by contractor.—(1) Beginning at the termination of the period of preliminary operation mentioned in Article XIV, and so long as the United States shall require the contractor to supply energy to the United States for the operation of either or both of said nitrate plants, the contractor shall pay to the United States monthly for the use of the Warrior extension and Warrior substation interest at the rate of 6 per cent per annum upon the actual cost to the United States of said extension and substation, less the amount of the accumulated fund referred to in Article XIX, as the same may vary at each monthly computation of such interest. In computing such cost there shall be excluded all payments by the United States for supervision, inspection, and protection of the Warrior extension or Warrior substation, but there shall be included the pro rata share of the contractor's fee mentioned in Article XIII attributable to the construction and equipment of the Warrior extension and Warrior substation. The contractor shall also pay to the United States interest monthly at the rate of six per cent (6 per cent) per annum upon the sum of thirty thousand dollars (\$30,000) and upon the cost of the rails and rail-joint material referred to in subdivision 7 of Exhibit E. The payments hereunder shall be made at the same time as the monthly payments due the contractor from the United States under Article XVIII are made.

(2) During such period as the contractor may under the provisions of Article XXI be relieved of said monthly payments, the contractor shall pay to the United States monthly in lieu of said monthly payments, one and one-half mill for each kilowatt hour of energy produced by the contractor at the Warrior extension and measured at the Warrior extension switchboard for sale to customers other than the United States. Said rate of 1½ mill is subject to reduction by an amount to be ascertained on the first day of each month by dividing by 200,000,000 the interest at 6 per cent per annum on the then accumulated fund.

ARTICLE XVIII.

Payments by the United States for electric energy, including minimum payments.—(1) The United States shall pay to the contractor at the rate of six and one-half (6½) mills for each k. w. h. of energy actually delivered to the United States at the Warrior substation. Said rate is based upon the power factor of the load of the United States measured at the Warrior substation being no less than eighty-five per cent (85%). Energy generated at the Warrior extension or the Warrior substation shall be measured at the low-tension side of the step-up transformers at said Warrior substation; and energy generated elsewhere on the contractor's system and delivered to the United States hereunder shall be measured at the Warrior substation either at the low-tension side of the said transformers, or, at the contractor's option, at approximately 110,000 volts. If so measured at 110,000 volts, the contractor shall supply the necessary instruments and accessories at its own expense.

(2) Where the amount due for energy at said rate of six and one half mills in any one calendar month from and after December 1, 1918 (said energy having been delivered at a maximum rate not in excess of the capacity of the Warrior extension), is less than thirty thousand (30,000) dollars, the United States shall, nevertheless, pay to the contractor the sum of thirty thousand (30,000) dollars as a minimum payment for service during such month, subject, however, to the provisions of the first paragraph of Article XXI.

(3) The contractor shall render all bills on or before the tenth day of each calendar month for electric energy furnished during the preceding calendar month, and payment thereof shall be made within fifteen days after such bills are rendered.

ARTICLE XIX.

Amount to be retained by United States from payments for electric energy.—From and after such date as the contractor shall begin to operate the Warrior extension and Warrior substation as a part of its own system the United States shall retain two mills per k. w. h. from the amounts payable to the contractor by the United States under Article XVIII hereof, except that (a) in no case shall the said minimum monthly payment by the United States be less than \$30,000, and (b) the United States shall retain no part of the payments due for energy delivered by the contractor at a rate in excess of the capacity at the time of the said Warrior extension, provided that said two mills shall no longer be retained by the United States when the accumulated fund shall equal the actual cost to the United States of the Warrior extension and the Warrior substation, computed as set forth in Article XI. The funds so retained shall accumulate in the hands of the United States but without the addition of interest, and shall be applied or otherwise disposed of in accordance with the provisions of Article XXII.

ARTICLE XX.

Price for electric energy to vary with price of coal and labor.—(1) The rate of six and one-half mills per k. w. h. is based upon the use of unwashed run-of-mine Alabama coal, having a heat value of approximately thirteen thousand five hundred (13,500) British thermal units per pound "as received," at the mine price of two dollars and thirty cents (\$2.30) per ton, and for variations from such standards the following adjustments shall be made monthly in said rate, but only as it relates to energy generated in the Warrior extension or Warrior station for the use of the United States.

The actual average cost per ton of coal consumed under the boilers of the Warrior extension and the warrior station shall be the average cost per ton of the total quantity of coal consumed, calculated on the basis of the mine prices fixed by the United States Fuel Administration for the respective mines, plus transportation charges. In the event that the United States Fuel Administration shall not fix such mine prices, then such actual average cost shall be calculated on the basis of the prevailing competitive market prices at the various mines from which the coal is obtained, plus transportation charges.

In the event that the average heat value of the coal used during any calendar month is less than thirteen thousand (13,000) or more than fourteen thousand (14,000) British thermal units, then said actual average cost of coal used during such month shall be corrected by multiplying such actual average cost by the

ratio of thirteen thousand five hundred (13,500) to the actual heat value of the coal as determined by tests. If the average heat value of the coal falls within the limits of 13,000 and 14,000 British thermal units no change shall be made in the actual average cost.

The said rate of six and one-half mills (\$.0065) shall be adjusted for such calendar month by an increase or a decrease of one hundredth of a mill (\$.00001) for each increase or decrease of one cent (\$.01) per ton in the corrected average cost of coal above or below said price of two dollars and thirty cents (\$2.30) per ton.

The price for coal used in determining said rate of six and one-half mills (\$.0065) shall not exceed the price at which an adequate and bona fide supply of coal for the operation of the Warrior extension can be procured at the time, and said cost of coal so used in determining said rate shall, except as otherwise provided herein, be the said actual average cost of the coal consumed during the calendar month for which the determination is made.

As soon as practicable after the first day of each month the contractor shall render to the United States a statement showing the actual average cost per ton for coal delivered during the preceding month to the track hoppers or coal-storage piles at Gorgas, the amount so delivered, the heat value of the coal, and the actual average cost of coal on hand at the beginning of the month for which bill is rendered. The term "ton" as used in this article shall mean the net ton of two thousand (2,000) pounds.

Either the contracting officer or the contractor may at any time request that analysis of representative samples of the coal used in the operation of the Warrior extension and Warrior station be made by a competent person acceptable to both parties to determine its quality and heat value. Upon failure of the parties to agree upon such a person within ten days after such request is made known, the Bureau of Standards shall make the analysis. If any such analysis shows that the heat value is higher than fourteen thousand (14,000) British thermal units per pound, then the United States shall pay the cost of the analysis; if the heat value is shown to be lower than thirteen thousand (13,000) British thermal units, the cost of the analysis shall be paid by the contractor, and if the heat value is shown to be not less than thirteen thousand (13,000) nor more than fourteen thousand (14,000) British thermal units, the cost of the analysis shall be divided equally between the United States and the contractor.

All coal tests made under this article shall be conducted in accordance with the standard method of analysis of the American Chemical Society and the bomb calorimeter shall be used in determining the heat value.

(2) In the event that the United States shall use energy obtained under this contract otherwise than in the manufacture of munitions of war, or in the event that the United States shall assign or transfer to another the right to obtain energy under this contract as hereinafter provided, then the following labor adjustment clause shall apply:

Should the cost of labor for the operation of the Warrior extension, said transmission lines, and said substations be increased the contractor may submit to the contracting officer or to the successor of the United States, as the case may be, a schedule at intervals of six months or more showing such increased cost over the cost prevailing on October 1, 1918. Upon the acceptance of such schedule, the rates payable for energy shall be increased by an amount proportionate to such increase in the cost of labor. Similarly, if in the opinion of the contracting officer or the successor of the United States, as the case may be, such cost of labor shall be decreased, the contracting officer or such successor, as the case may be, may at like intervals submit a schedule to the contractor showing such decrease below the cost prevailing on October 1, 1918. Upon the acceptance of such schedule the rates payable for energy shall be decreased by an amount proportionate to such decrease in the cost of labor. The contractor shall with all convenient speed file with the contracting officer a schedule showing said cost of labor prevailing on October 1, 1918.

Each party to whom a schedule may be presented under this subdivision shall have one month's time within which to verify the correctness thereof. Any schedule not rejected within such time shall be deemed to have been accepted as correct. In the event of disagreement as to any schedule within one month of presentation thereof the matter in dispute shall be adjusted under Article XXV. Any changes in rates under this article shall relate back to and take effect on the first day of the month next following the submission of said schedules or from such other date as may be fixed under Article XXV.

ARTICLE XXI.

Suspension of demand for electrical energy by the United States.—The United States may at any time and from time to time upon sixty days' written notice, suspend its demand for energy, in which event and provided such suspension shall exceed sixty days, the United States shall during the period thereof be relieved of the obligation to make said minimum monthly payment of thirty thousand (30,000) dollars and the contractor shall, during such period, be correspondingly relieved of the payments mentioned in subdivision (1) of Article XVII. The service to be rendered under this contract shall be restored on sixty days' written notice to the contractor by the United States, and after such restoration said minimum monthly payment and said payments for the use of Warrior extension and substation shall again be made, as if there had been no suspension.

A suspension of service under this article shall not operate to relieve the contractor of the obligation to maintain said transmission lines. In case such suspension exceeds sixty (60) days, the United States shall for the period of suspension in excess of sixty (60) days, pay the contractor the cost of maintaining said transmission lines, plus 10 per cent of such cost. The United States may, on thirty (30) days' written notice to the contractor, take over the maintenance of said transmission lines during any period of suspension of service.

Nothing herein contained shall prevent the contractor during any such suspension from continuing to operate the Warrior extension and substation upon making payment for energy as provided in subdivision (2) of Article XVII.

ARTICLE XXII.

Sale to or purchase by contractor.—(1) At any time subsequent to three years after the termination of the war, the United States shall have the option to sell to the contractor and the contractor shall, upon written demand of the United States, buy all its rights, title, and interest in and to the Warrior extension and Warrior substation with all rights appurtenant thereto at the value fixed by arbitration as hereinafter provided. The accumulated fund referred to in Article XIX shall be applied in payment of said value, and any excess of said fund over said value shall be paid over to the contractor, provided that if the actual cost of Warrior extension and Warrior substation to the United States shall exceed said value, then only the excess of said fund over said cost shall be paid over to the contractor. If said value shall exceed said fund, then the contractor shall pay to the United States the excess in the manner hereinafter provided. As soon as the amount of said value shall be paid or secured as in this article provided, the United States shall convey all of its right, title, and interest in and to said properties to the contractor.

(2) If and when said accumulated fund shall be equal to or greater than the actual cost to the United States of the Warrior extension and the Warrior substation, the contractor may demand that the United States convey all of its right, title, and interest in and to said properties to the contractor and that it pay over to the contractor the excess, if any, of said fund over said cost, retaining the balance. The United States shall comply promptly with such demand.

(3) The contractor may also at any time demand that the United States convey to it all of the right, title, and interest of the United States in and to the Warrior extension and the Warrior substation upon payment to the United States of any excess of the actual cost of said properties over the amount of said accumulated fund then in the possession of the United States. And upon payment to the United States of such excess the United States shall comply with said demand, retaining the whole of said accumulated fund.

(4) At any time after December 1, 1926, or such earlier period as the United States shall finally cease to take energy under this contract, said accumulated fund being less than the actual cost to the United States of the Warrior extension and Warrior substation, the contractor may demand that the value of said properties be fixed by arbitration; and

(a) If the value so fixed is equal to or less than the amount of such accumulated fund, then the United States shall convey to the contractor all of its right, title, and interest in and to said properties by proper instruments in writing within sixty (60) days after notice of the award, retaining in payment the whole of said fund.

(b) If the value so fixed be greater than said fund, then the United States shall upon payment by the contractor of the amount by which such value is greater than said fund, or payment thereof being secured as hereinafter provided, convey all of its right, title, and interest in and to said properties to the contractor by proper instruments in writing within sixty (60) days after notice of the award, retaining in payment the whole of said fund.

(5) In the event that the contractor shall on demand of the United States fail or refuse to purchase the Warrior extension and Warrior substation under any of the foregoing subdivisions of this article, the United States may sell the same to another, subject to the conditions that said properties shall not be operated and that they shall be removed within six (6) months after the sale has been consummated. Upon the consummation of such a sale with another purchaser the United States shall pay over to the contractor the whole of said accumulated fund, less the amount, if any, by which the actual cost of the said properties shall exceed the price realized from such sale.

(6) In the event that (a) the Warrior extension and Warrior substation are not sold in the manner herein provided to the contractor or to another within the period of ten (10) years referred to in Article XV, or (b) said properties not having been so sold, the United States or its said successor shall cease for 365 consecutive days to take any energy from the Warrior extension; the United States shall, upon six months' notice in writing from the contractor, remove the Warrior extension and Warrior substation from the lands of the contractor unless it shall within ninety (90) days after receipt of such notice proceed to exercise its option under subdivision (1) of this article. In the event of removal pursuant to such notice, the United States shall leave the premises in a neat and workmanlike condition and shall pay over to the contractor the entire amount of the said accumulated fund then in its possession.

(7) If the United States or its said successor shall for a period of two consecutive years fail to take energy from the Warrior extension, and in any event at the expiration of said period of 10 years, the United States shall, upon six (6) months' written notice from the contractor, remove such of said transmission lines and appurtenances owned by it as are located on land or rights of way owned by the contractor; provided, that upon receipt of such notice the United States may require the contractor to purchase all of its right, title, and interest in and to said transmission lines and their appurtenances at their fair value as fixed by arbitration.

(8) The contractor shall have a period of five years in which to make payment of any amounts due the United States under subdivisions (1) and (4) of this article over and above said accumulated fund, provided that all deferred payments shall be secured in a manner satisfactory to the Chief of Ordnance. During such period the contractor shall pay to the United States interest on deferred payments at the rate of 5 per cent per annum. At the request of the contractor said period shall be extended two and one-half years, interest during such extended period to be at the rate of 6 per cent per annum. The contractor may anticipate any deferred payment in whole or in part.

(9) The value of said properties to be determined under this article shall be their fair value, and it shall be fixed by arbitration under Article XXIV.

(10) Actual cost under this article shall be computed as provided in Article XI.

ARTICLE XXIII.

Energy for successor in interest of the United States.—If at any time within the period of ten years referred to in Article XV the United States shall sell or lease its said nitrate plants at Sheffield and at Muscle Shoals, or either or any part of said plants, the United States may assign and transfer to the purchaser or lessee thereof (in this contract referred to as the successor of the United States) the right to demand and receive electric energy under this contract to the extent of the capacity of the Warrior extension at the time, and any other rights hereunder as may be agreed upon between said successor and the United States, excluding, however, the right to furnish coal to the contractor and the right to require the contractor to supply energy from other parts of its system under Article XV, also the provisions of Articles XVI, XVII, subdivision (3) of Article XVIII, Articles XIX, XXI, and XXII.

If the successor desires to accept said assignment and transfer, it shall so signify in writing simultaneously with the execution of said assignment and transfer by the United States, and shall thereupon be deemed to have accepted

and assumed all of the obligations of the United States under this contract in relation to the portion thereof so assigned and transferred (including the obligation under subdivisions (1) and (2) of Article XVIII), except as modified in the following respects:

(a) Such successor may give the contractor six months' notice in writing that it will cease taking energy under this contract. Such notice shall have the effect of terminating all of the rights and obligations of the successor under this contract from and after the expiration of such six months' period, and the successor shall thereafter have no further right to demand energy hereunder.

(b) Bills shall be rendered monthly by the contractor for energy supplied during the previous month, and if not paid at its office within ten days from the date of rendition the contractor shall have the right upon five days' written notice to suspend service; and if not paid within a further period of thirty days the contractor shall have the right, at its option, by notice to the successor, to cancel and terminate its agreement for further delivery of energy to the successor, whereupon all rights of the successor as to such further energy shall cease.

(c) Without the written consent of the contractor the successor shall not sell or dispose of any energy furnished hereunder or which may be generated directly or indirectly therefrom, except to tenants on the successor's premises; nor transfer or assign to anyone, directly or indirectly, the right to obtain energy under this contract. No right or benefit hereunder shall be assigned or transferred by operation of law without like consent.

(d) Service to said successor shall, in addition, be subject to such other reasonable rules and regulations, not inconsistent with the terms of this contract, as may then be in effect or as may thereafter be established from time to time by the contractor or by the Alabama Public Service Commission.

Upon the execution of said assignment and transfer by the United States and its acceptance as above provided by the said successor, the United States shall be relieved of all of its liabilities under this contract in so far as they relate to the portion thereof so assigned and transferred.

ARTICLE XXIV.

Arbitration.—Whenever either party is entitled to and desires the determination of the value of any of the properties mentioned in Article XXII, it shall so state in writing to the other party and shall add the name and address of the arbitrator chosen by the party demanding the arbitration. The other party shall, within fifteen (15) days thereafter, choose its arbitrator and notify the party demanding the arbitration of its choice, giving the name and address of such arbitrator. The two arbitrators so chosen shall, within twenty (20) days after being notified by either party that the second arbitrator has been chosen, choose a third arbitrator. If said two arbitrators are unable within twenty (20) days after being so notified to agree upon such third arbitrator, then upon the application of either party, the senior judge of the United States Circuit Court of Appeals for the Fifth Circuit shall have the power to appoint such third arbitrator; ten (10) days' notice of the application to the said senior circuit judge being given by the party applying to the other party. In the event of the disqualification or refusal to act of the said senior circuit judge, the other judges of the said circuit court shall, in the order of their appointment, on similar request have power to appoint such third arbitrator. Vacancies in the board shall be filled in the manner prescribed for the original appointments. By agreement of the parties all of said periods may be extended.

If either party fails to choose an arbitrator within thirty (30) days after receiving the statement in writing of the party desiring the arbitration, then the other party shall choose both, and the third shall be chosen in the manner hereinbefore provided. If the board fails within ninety days after the appointment of the third arbitrator to make a decision, then the third arbitrator shall, unless the time is unanimously extended by the board, be relieved of duty and a new third arbitrator chosen by the two arbitrators or by a circuit judge, in the manner hereinbefore provided.

The arbitrators, when chosen, shall promptly fix a time and place for the hearing, and then and there the parties shall attend and present their respective proofs and arguments. The hearing may from time to time be adjourned by the arbitrators by a writing notifying the parties of the time and place to which

such adjournment is made. The arbitrators shall with all reasonable speed determine all disputes and questions submitted to them and notify the parties in writing of their determination. Any award when signed by any two of the arbitrators shall be final and conclusive upon both parties. The expense of the arbitration, including the arbitrators' fees, shall be ascertained and borne as determined by the arbitrators. Said fees shall be subject to the approval of the Chief of Ordnance.

ARTICLE XXV.

Disputes.—Except as herein otherwise provided, all disputes and questions which shall arise under this contract shall be referred to the Chief of Ordnance for determination. If, however, the contractor shall feel aggrieved at any decision of the Chief of Ordnance upon such reference it shall have the right to submit the same to the Secretary of War.

ARTICLE XXVI.

Time—Delays due to causes beyond contractor's control.—It is essential that all work and operations under this contract be carried out as expeditiously as possible, and to this end the contractor agrees to perform all such work and operations on its part with great diligence and the highest speed practicable consistent with the proper performance thereof.

The contractor shall not be held responsible for or be deemed to be in default hereunder by reason of delays in the performance of this contract or interruptions to service caused by strikes, fires, explosions, riots, acts of God, failures of transportation, or other causes beyond the control and without the fault of the contractor: *Provided*, That the contractor shall have promptly and fully notified the contracting officer of any such cause of delay and shall have used its best efforts promptly to remove the same and to obviate the effects thereof: *And provided further*, That such delay shall not have been due to the contractor's failure to comply with any of the provisions of this contract. The contractor shall proceed with the performance of this contract as soon as, and to the extent that, any such cause of delay shall have been removed.

ARTICLE XXVII.

CANCELLATION AND TERMINATION BEFORE COMPLETION.

SECTION 1. Cancellation for contractor's default.—If the contractor shall abandon any construction work under this contract, the Chief of Ordnance may cancel this contract by thirty days' notice in writing, without prejudice to any other rights or remedies or to any claim which the United States may have against the contractor. Thereupon the United States shall have the power to complete such construction work or enter into agreements with others for the completion thereof, in whole or in part, at the expense of the contractor. Work completely performed in accordance with the requirements of this contract at the date of any such cancellation shall be accepted and paid for by the United States.

Sec. 2. Termination in public interest.—If, in the opinion of the Chief of Ordnance, the public interest shall so require, the construction work required by this contract may be terminated by the United States by thirty days' notice in writing. Such termination shall be without prejudice to any claims which the United States may have against the contractor under this contract. After the receipt of such notice the contractor shall not order any further materials or facilities, or enter into any further subcontracts, or make any further purchases in connection with the performance of this contract, without written consent previously obtained from the contracting officer, but inspection of the completed work and acceptance thereof by the United States in accordance with the terms of this contract shall continue during such period of thirty days as though such notice had not been given.

In the event of and upon such termination of this contract prior to completion for any reason other than the abandonment thereof by the contractor, the United States shall make payments to and protect the contractor as follows:

(1) The United States shall pay for (a) all expenditures made by the contractor in good faith and in connection with the performance of this contract for which the United States is obligated to pay under the terms of this contract and which the United States has not previously paid, (b) in addition

the United States shall pay the contractor for all work completed in accordance with the provisions of this contract the sum provided as profit thereon under the terms of this contract and not theretofore paid.

(2) The United States shall discharge the contractor's outstanding obligations incurred by the contractor in good faith in connection with the performance of this contract for which the contractor has not theretofore received reimbursement or protection from the United States and which are of such character that the United States would, under the terms of this contract, have become liable to reimburse the contractor for its expenditures thereunder, had this contract not been so terminated.

Sec. 3. Assignment of subcontracts.—In the event of the cancellation and termination of this contract, pursuant to the provisions of the above sections 1 and 2, the contractor shall, upon the request of the contracting officer, assign to the United States, or to such person as the contracting officer may direct, the unperformed portion of any or all contracts and subcontracts made by the contractor in contemplation of or in connection with the performance of this contract. In the event of the failure of the contractor to assign any such contract or subcontracts as herein provided, this contract shall operate as such assignment. It is understood that such assignment in and of itself shall not compel the United States to assume or become responsible for any obligation of the contractor which has arisen prior to such assignment by reason of the contractor's performance of, or failure to perform, the contract or subcontract so assigned.

Sec. 4. Taking possession of contractor's plant.—In the event of the cancellation or termination of this contract pursuant to the provisions of the above sections 1 and 2, the United States may, for the purpose of completing the performance of the work herein contracted for, or any part thereof, take possession of and use any or all of the plants and properties of the contractor used in accordance with Article VII, in carrying out this contract. In such event the United States shall pay to the contractor such reasonable sum for the use thereof as may be agreed upon between the contracting officer and the contractor, or, if they fail to agree, as may be determined in the manner and with the effect provided in Articles XXIV or XXV. Such plants and properties shall be occupied and used by the United States without cost or expense to the contractor; and during such use the United States shall save the contractor harmless from all damages for injury to person or property resulting from such use, the United States, however, reserving any claims which it may have against the contractor under this contract.

ARTICLE XXVIII.

Measuring instruments—Testing.—All energy delivered shall be measured by duplicating polyphase integrating watt-hour meters or others of standard make, to be provided by and installed at the expense of the United States, and kept in repair to the satisfaction of the contracting officer by the contractor at its expense. All energy shall be measured both as to rate of supply and quantity by the average duplicate readings of the meters.

The meters shall be tested and adjusted by the contractor to measure and record within one per cent of absolute accuracy under average operating conditions. In case of dispute, each of the parties hereto shall, upon seven days' written notice to the other, have the right to disconnect any meter and have it tested by a competent and disinterested person acceptable to both parties; and for failure of the parties to agree upon such a person within ten days after such notice has been served, he shall be selected by the Chief of Ordnance. If any meter shall, upon being tested, record more than two per cent in excess of correct registration, the contractor shall pay the cost of the test; if it shall record less than ninety-eight per cent of the correct registration, the United States shall pay the cost of the test; and if the error shall not exceed two per cent, the cost of the test shall be borne by the party in whose behalf the test was made. Any adjustment in the charge for energy made necessary on account of an error in the meter shall cover a period of not exceeding thirty days prior to the time when such test was called for. The United States shall pay for current consumed during such time as a meter is out of order in accordance with the registration of the second or duplicate meter above referred to and in case both meters are in error an amount to be estimated upon the basis of the registration of the meter during a similar period when they were functioning properly.

At all tests, calibrations, readings, and adjustments by either party the other party shall have the right to be represented.

ARTICLE XXIX.

Approval by contracting officer.—The contractor shall not enter into contracts in connection with construction work or proceed with such work until the approval of the contracting officer has been obtained.

Inspection.—All work of every kind to be performed and all property to be acquired or installed under this contract shall at all times be subject to inspection and test by the duly authorized inspectors of the Ordnance Department, and the contractor shall (but at the expense of the United States) furnish all reasonable facilities and assistance requested by such inspectors for the performance of their duties. Such inspectors may reject all work and materials not complying with the terms of this contract, and all work and materials so rejected shall be replaced by the contractor without charge therefor to the United States.

Access to properties.—The duly authorized representatives of the United States shall at all times have free access to the Warrior extension, the Warrior substation, the transmission lines, and all other property owned by the United States for the purposes of inspection testing, making inventories, and any other purpose under this contract, provided that no directions or instructions shall be given the employees of the contractor in respect to the operation of said properties except as in Article XXXV provided. Such representatives of the United States shall also have free access to the properties of the contractor for the purposes of inspection and testing so far as necessary under this contract.

Records.—The contractor shall keep complete records, of such character and in such form as may be approved or required by the contracting officer, as to all construction expenses and as to such operating expenses as may effect the rate to be charged the United States for energy or any other right of the United States hereunder, all of which records shall at all times be open to the inspection of the United States or its duly authorized representatives. Said records shall be retained by the contractor at the disposition of the United States for the period of six years after the termination of this contract.

Audit—Erroneous payments. All accounts shall be subject to audit by the United States. Payments by the United States shall be subject to correction for errors, if any.

ARTICLE XXX.

Payments not subject to counter claims.—All payments hereunder shall be made as and when due, without deduction for any claim or counterclaim; provided, however, that the United States before making any payment as to which there may be a bona fide question may require, as a condition thereof, the giving of an adequate bond for the repayment of such part thereof as may, under Article XXV or otherwise, be found not to be due, failing which, payment shall be made in escrow, subject to the terms of this agreement, to some national bank in the city of Birmingham, to abide the decision of competent authority.

ARTICLE XXXI.

Incumbrances.—The contractor agrees not to create or suffer to be created any lien or incumbrance against any work paid for by the United States, or against any property entering into its performance, and in the event any such lien or incumbrance is created, the contractor agrees promptly to pay and discharge the same or to furnish proper bond or security to have the same released, to the end that said work may become the property of the United States free and unincumbered. In case the contractor shall fail to pay and discharge any such lien or incumbrance or to furnish proper bond or security to have the same released, the United States may do so at the contractor's expense and may deduct from any payments due to the contractor hereunder the amount of any expense so incurred by the United States.

ARTICLE XXXII.

Bond.—The contractor shall, prior to December 1, 1918, furnish to the United States a bond in the sum of fifty thousand dollars, conditioned upon the full and faithful performance by the contractor of all terms, covenants, and conditions hereof in relation to construction work and upon the prompt payment to all persons supplying labor or materials in the prosecution of the construction work under this contract. Such bond shall be in form and with sureties satisfactory to the contracting officer, and, unless it is furnished within the time limited, this agreement may, at the option of the contracting officer, be canceled. The United States shall reimburse the contractor for the premium of such bond.

ARTICLE XXXIII.

Revenue from housing, stores, etc.—All revenue from the operation of any housing, boarding houses, commissaries, stores, infirmary, hospital, and other facilities, the property of the United States, and from refunds, shall during the period of construction be accounted for by the contractor to the United States and shall belong to the United States.

ARTICLE XXXIV.

Contract nonassignable.—Neither this contract nor any interest herein shall be transferred by the contractor to any other party, except to the extent permitted by section 3477, United States Revised Statutes.

Officials not to benefit.—No Member of or Delegate to Congress or Resident Commissioner is or shall be admitted to any share or part of this contract, or to any benefit that may arise therefrom; but this article shall not apply to this contract, so far as it may be within the operation or exceptions of section 116 of the act of Congress approved March 4, 1909 (35 Stats., 1109).

Prison labor.—No person or persons shall be employed in the performance of this contract who are undergoing sentences of imprisonment at hard labor which have been imposed by the courts of the several States, Territories, or municipalities having criminal jurisdiction.

ARTICLE XXXV.

Service of notices.—Notices, directions, instructions, and demands under this contract shall be given in writing only and shall be deemed served upon the contractor if addressed to it at Birmingham, Ala., and either delivered to the general manager at its office in said city or deposited in a postpaid or penalty envelope in any post-office box regularly maintained by the United States. The address of the contractor may be changed at any time by notice in writing to the contracting officer.

Notices shall be deemed served upon the United States if deposited in the registered mail addressed to the Chief of Ordnance, Washington, D. C. All such notices shall identify this contract by stating the contractor's name, the date thereof, and the file and war order number as given on the cover hereof.

The said general manager and the contracting officer may from time to time designate, in writing, others to receive and give notices, directions, and instructions as to specific matters as well as the manner in which the same may be given and received.

ARTICLE XXXVI.

Definitions.—Whenever in this contract the words hereinafter enumerated are used, they shall mean what is set opposite them:

Contractor: The party of the first part and its legal representatives, successors, and assigns.

Chief of Ordnance: The Chief of Ordnance, the Acting Chief of Ordnance, or any duly authorized representative of either.

Contracting officer: The contracting officer executing this contract, his successor or successors, his or their duly authorized agent or agents, and any one from time to time designated by the Chief of Ordnance to act as contracting officer.

Termination of the war: The time when the President of the United States shall by proclamation declare the war terminated.

In witness whereof the parties hereto have caused these presents to be executed and delivered in quadruplicate at Washington, D. C., the day and year first above written.

ALABAMA POWER COMPANY,
By JAMES MITCHELL, *Its President*,
UNITED STATES OF AMERICA,
By WILLIAM WILLIAMS,
Lt. Col. Ord. Dept., U. S. A.,
Contracting Officer.

Witnesses:

C. F. BEAMES.

FRANK D. MAHONEY.

SCHEDULE A.

Being description of Warrior extension, annexed to and made a part of agreement dated December 1, 1917, between Alabama Power Co. and United States of America:

WARRIOR EXTENSION.

1. New power station building of structural steel and brick construction adjacent to contractor's present power generating station.
2. One 225 feet by 18 feet inside diameter radial brick stack.
3. *Apparatus to be installed in said new power station building.*—One 30,000 k. w. General Electric Co.'s (33,333 k. v. a.) 13,200 volt, 3 phase, 60-cycle turbo-generator with 140 k. w. 250 volt direct connected D. C. exciter.
4. One 56,000 square feet Worthington surface condenser together with one 48-inch centrifugal circulating pump driven by 653 h. p. General Electric Co.'s motor; three No. 10 Worthington hydraulic vacuum pumps; two combined steam driven hydraulic supply hot-well pumps; necessary piping; car spring supports; 200 spare condenser tubes; 200 spare ferrules; and 500 tube packings.
5. Twelve 1,200 B. H. P. Babcock & Wilcox Stirling type boilers with superheaters designed for 225 pounds pressure, 200 degrees superheat.
6. Twelve sets of soot blowers for above boilers.
7. Eleven 12-retort Westinghouse underfeed stokers with driving mechanism and Westinghouse engines.
8. One 12-retort Taylor stoker with ABC engine and steam dump grate.
9. Two 36-inch link belt coal conveyors, crusher, and screen with necessary structural support, cross-over dump tracks and housing, substantially as shown on drawings, E-6900, E-6902, C-6658, C-6633, C-6794, C-7153.
10. Two reinforced-concrete coal bunkers.
11. Twenty-four coal gates.
12. Twenty-four automatic weighing machines under coal gates.
13. Twenty-four coal chutes.
14. Twelve reinforced-concrete ash hoppers.
15. Thirty-six 36 by 36 inch ash gates.
16. One 1,000-gallon 50-foot head vertical sump pump direct connected and driven by a motor, with automatic float switch in condenser room.
17. One 1,000-gallon 20-foot head centrifugal sump pump for ash room.
18. Two 100-gallon 40-foot head vertical bilge pumps with automatic float switch.
19. One 15-ton electric trolley locomotive, 250 volt, for handling ashes.
20. Twelve 2 cubic yard rocker dump ash cars, 36-inch gauge.
21. One set of boiler gauges and instruments.
22. Two double unit 430,000 pounds per hour Cochrane feed water heaters.
23. Twelve Copes water feed regulators.
24. Four 1,400-gallon 565 feet head Alberger centrifugal boiler feed pumps; 2 driven by General Electric Co. motors and 2 driven by Alberger steam turbines.
25. Four 80,000 cubic feet per minute Buffalo blowers, each directly connected to a 150 H. P. Westinghouse motor.
26. Four 80,000 cubic feet per minute Green fans, each directly connected to a 150 H. P. Kerr steam turbine.

27. Two 1,200-gallon 150-foot head Alberger centrifugal house service pumps; one driven by General Electric Co. motor; one driven by Alberger steam turbine.

28. One 42-inch Crane Co.'s atmospheric exhaust valve.

29. One set steam exhaust and water piping.

30. One set of Nonpareil steam pipe covering.

31. One 9-panel 550 volt service switchboard for powerhouse motors.

32. One 4-panel D. C. exciter and railway switchboard.

33. One 150-KW. 250 volt D. C. 550 volt A. C. motor-generator set.

34. Six 2,000 amp., 15,000 volt, 3-phase oil switches, with cells.

35. One 800 amp., 15,000 volt, 3-pole single-throw oil switches, with cells.

36. Two 300 amp., 15,000 volt, 3-pole single-throw oil switches, with cells.

37. Two 750 KW., 13,200-55 volt, 3-phase indoor type oil insulated self-cooled transformers, for station service.

38. Two 13,200 volt busses with compartments and with all copper connections and insulators.

39. Three reactance coils, complete, with mountings.

40. Eleven sets of control cables and conduits.

41. Provision for storage of coal, grading, trestles, and tracks, as shown on drawing C-7139, but not including crane or other coal-handling devices.

42. Yard tracks as shown on drawing E-6887.

43. One standard-gauge steam locomotive. (Used during construction.)

44. Eight standard-gauge coal cars, for reloading from coal storage.

45. One 15-ton standard-gauge locomotive crane with boom about 35 feet long, used during construction and to be overhauled and equipped with coal bucket for auxiliary coal handling.

46. One steel guy derrick and engine, for use during construction.

47. One wood guy derrick and engine, for use during construction.

48. Twelve type D or E frame houses, to be in accordance with drawings dated May 29, 1918, sheets 1, 2, 3, 4 for each type—no serial number—by Warren & Knight, architects, Birginingham, Ala.

49. One bath and locker building, in accordance with drawing C-7055.

50. Twenty four-room frame houses, used during construction, to be improved according to drawings C-6453 and 6454, for housing operators.

51. Seventeen two-room frame shanties.

52. Four bunk houses, for use during construction.

53. One hospital.

54. One mess hall, commissary, and storeroom, as additions to Alabama Power Co. facilities, as shown on drawing E-6887.

55. One ice plant.

56. Six miscellaneous commissary and office buildings of a temporary nature for use during construction work only.

57. Water, sewer, light, and telephone lines as additions to Alabama Power Co. facilities, as shown on drawing E-6887.

58. One guard fence (with towers) to inclose powerhouse and substation, substantially as shown on drawings C-6532, A-6914, E-6887.

59. Also such additional facilities as may be authorized by the contracting officer prior to December 1, 1918, for use in connection with the construction and operation of said Warrior extension.

60. Copies of the drawing referred to in this schedule, identified by the parties hereto, are on file in the office of Col. J. W. Joyes, Ordnance Department, Washington, D. C., and are hereby made a part of this agreement.

SCHEDULE B.

Being a description of the Warrior substation and the apparatus therein, annexed to and made a part of agreement dated December 1, 1917, between Alabama Power Co. and United States of America.

1. The Warrior substation shall consist of an extension to the present switching house of the Alabama Power Co. of brick and concrete to house switchboards and control apparatus, and be the terminus of control conduits and cables.

2. Also an extension to the Alabama Power Co. power plant to house oil switches, bus structures, and auxiliary transformers and equipment.

3. One 110,000-volt structural steel bus and switching structure, as shown on drawing C-6532, all erected on suitable concrete foundations.

4. Ten 6667 kva 110,000/13,200-volt single phase oil insulated, water-cooled transformers.
5. Four 3333 kva 44,000/13,000-volt single phase oil insulated, water-cooled transformers.
6. Two 750 kva 13,200/550-volt 3-phase oil insulated, water-cooled transformers.
7. One completed set of oil and water piping for all transformers.
8. Two 110,000-volt electrolytic lighting arresters.
9. Six 300-ampere 110,000-volt choke coils.
10. Eight 13,200-volt 2 pole single-throw indoor type oil switches.
11. Eight 110,000-volt disconnecting switches.
12. Eight 15,000-volt disconnecting switches.
13. One complete set of 110,000-volt copper busses, with necessary connections to apparatus and insulators.
14. One 12-panel switchboard for controlling above apparatus, complete, with necessary indicating and measuring instruments and appurtenances.
15. One set of control cables and conduits, as shown on drawing C-6532.
16. Copies of the drawings referred to in this schedule, identified by the parties hereto, are on file in the office of Col. J. W. Joyes, Ordnance Department, Washington, D. C., and are hereby made a part of this agreement.

• SCHEDULE C.

Being a description of the transmission line extending from the Warrior substation to the Muscle Shoals substation on the land of the United States adjacent to United States nitrate plant No. 2, annexed to and made a part of agreement dated December 1, 1917, between Alabama Power Co. and United States of America :

1. One single-circuit, 3-phase, 60-cycle, 100,000-volt transmission line from the Warrior substation at Gorgas, Ala., to the land of the United States, on which is located its Muscle Shoals nitrate plant and substation, and a double-circuit transmission line of similar specifications from the boundaries of the said land of the United States to the Muscle Shoals substation adjacent to the steam generating plant of the United States nitrate plant No. 2, all as shown on drawing No. A-6914.

In general, the transmission lines to consist of three 250,000 C. M. B. & S. gage copper conductors, supported by suspension type insulators from H frame structures, consisting of two creosoted wooden poles and wooden cross arms. Also two 1/4" galvanized Siemens-Martin ground wires to be attached to the poles, together with the necessary guy wires, braces, and other hardware and appurtenances. In accordance with specifications and bill of material shown on drawing C-7070.

2. A single-circuit telephone line consisting of two No. 10 copper-clad wires supported on wooden cross arms attached to wooden poles separate from the transmission line and parallel thereto and made available for use at frequent intervals by means of telephone booths and instruments.

3. A sectionalizing and lightning arrester station located approximately halfway between Gorgas, Ala., and United States nitrate plant No. 2 at Muscle Shoals.

4. Six patrolmen's and 10 guards' houses and storehouse located at proper intervals along the line.

5. Transformer and substation equipment located at the point of junction of the quarry branch line with the transmission line.

6. Such other facilities as may be authorized and approved from time to time by the contracting officer and erected or installed by the United States in connection with the transmission lines and appurtenances mentioned in said agreement.

7. Copies of the drawings referred to in this schedule, identified by the parties hereto, are on file in the office of Col. J. W. Joyes, Ordnance Department, Washington, D. C., and are hereby made a part of this agreement.

SCHEDULE D.

Being a description of the Muscle Shoals substation and the apparatus contained therein, annexed to and made a part of agreement dated December 1, 1917, between Alabama Power Company and United States of America :

1. One 110,000-volt structural steel bus and switching structure, as shown on drawing C-6792, erected on suitable concrete foundations.

2. Seven 6667 kva 13,200/110,000 volts single phase transformers.
3. Two 110,000-electrolytic lightning arresters.
4. Four 110,000-volt outdoor type 3-pole oil switches.
5. Four 110,000-volt 3-phase choke coils.
6. Eight 110,000-volt disconnecting switches.
7. One set of oil and water piping for all transformers including spare oil tank.
8. One set of 110,000-volt buses with necessary connections to apparatus and insulators.
9. Such other facilities as may be authorized and approved from time to time by the contracting officer and erected or installed by the United States in connection with the transmission line.
10. Copy of the drawing referred to in this schedule, identified by the parties hereto, is on file in the office of Col. J. W. Joyes, Ordnance Department, Washington, D. C., and is hereby made a part of this agreement.

SCHEDULE E.

In relation to Drifton extension railroad, annexed to and made part of agreement, dated December 1, 1917, between Alabama Power Co. and United States of America:

- (1) The United States Railroad Administration shall rehabilitate and put in condition for service at its expense the disused track extending southeast from Drifton about 7,000 feet.
- (2) The United States shall acquire the right of way for the Drifton extension from the end of the disused track of Drifton branch to the property of the Alabama Power Co.
- (3) The Alabama Power Co. shall construct at its expense said extension from the end of the disused track to the terminal at Warrior.
- (4) The Railroad Administration shall operate said extension for which the Alabama Power Co. shall pay the Railroad Administration a rate of 30 cents per ton on coal from mines on the Drifton extension to the Warrior station and Warrior extension, such rate to be added to the cost of coal transported over said extension for use in operating the Warrior station and Warrior extension.
- (5) The Railroad Administration shall maintain the rehabilitated track, but the cost of maintaining said extension shall be assumed by the power company.
- (6) The Railroad Administration shall assist the power company in building said extension and shall furnish the construction plant for this purpose if required.
- (7) The United States shall supply the rails and rail-joint material required for the portion of said extension to be built by the Alabama Power Co., and shall in addition contribute \$30,000 toward the cost of work to be done by the Alabama Power Co., said sum and the cost of said rails and joints shall be deemed a part of the actual cost of the Warrior extension for the purposes of Article XXII.
- (8) The United States shall grant the Alabama Power Co. an easement over the right of way to be acquired by the United States pursuant to the foregoing for the period of such easement, and provided such period is twenty-five years or more the Alabama Power Co. shall, upon taking over said railroad extension, reimburse the United States for the cost of such easement.

EXHIBIT F.

Items included in cost of the work annexed to and made a part of agreement dated December 1, 1917, between Alabama Power Co. and United States of America:

- (a) All labor, material, apparatus, and supplies. All hand tools not owned by the workmen, supplies and equipment necessary for said work; but this shall not be construed to cover machinery or equipment mentioned in section (c) of this schedule. The contractor shall make no departure from the standard rate of wages being paid in the locality where said work is being done without the prior consent and approval of the contracting officer.
- (b) All subcontracts made by the contractor in accordance with the provisions of this agreement.
- (c) Rental actually paid for construction plant and other equipment, in sound and workable condition, at such rates as may be approved by the con-

tracting officer as being necessary for the proper and economical prosecution of the work.

Rental to the contractor for such construction plant or parts thereof as it may own and furnish at such rates as may be approved by the contracting officer.

When such construction plant or any part thereof shall arrive at the site of the work the contractor shall file with the contracting officer a schedule setting forth the fair valuation at that time of each part of such construction plant. Such valuation shall be deemed final unless the contracting officer shall within five (5) days after the machinery has been set up and is working modify or change such valuation, in which event the valuation so made by the contracting officer shall be deemed final.

When and if the total rental for any such part shall equal the valuation thereof, no further rental thereafter shall be paid and title thereto shall vest in the United States.

The contracting officer may at his option purchase for the United States any part of such construction plant by paying the difference between the valuation of such part or parts and the rentals paid therefor.

Rates of rental as substitutes for rental rates then in effect may be agreed upon in writing between the contractor and the contracting officer, such rates to be in conformity with the rates of rental charged in the particular territory in which the work covered by this contract is to be performed. If the contracting officer shall furnish or supply any such plant or equipment, the contractor shall not be allowed any rental therefor. Rental for the use of the contractor's machine shop at the site of the work to be at such rates as shall be agreed upon by the contracting officer and the contractor.

(d) Loading and unloading such construction plant, the transportation thereof to and from the place or places where it is to be used in connection with said work, subject to the provisions hereinafter set forth, the installation and dismantling thereof, and ordinary maintenance, repairs, and replacement during its use in the said work.

(e) Transportation and expenses to and from the work of the necessary field forces of the contractor. Procuring labor and expediting the production and transportation of material and equipment.

(f) Salaries of engineers, superintendents, timekeepers, foremen, and other employees at the field offices of the contractor in connection with said work, also the salaries of other employees engaged on this work at the contractor's principal office. In case the full time of any such employee of the contractor is not applied to said work but is divided between said work and other work his salary shall be included in this item only in proportion to the actual time applied to this work. The salaries of the contractor's executive and general officers shall not be included.

(g) Rent for office space required for necessary offices in the city of Birmingham, Ala., but this shall not include payment of any rent for the contractor's regular offices or any expense incident to conducting same. Rent for buildings and equipment required for necessary field offices, and the cost of maintaining and operating commissaries and hospitals and minor expenses as telegrams, telephone service, expressage, postage, etc., in connection with such office.

(h) Such bonds, fire, liability, and other insurance as the contracting officer may approve or require and such losses and other expenses not compensated by insurance or otherwise as are found and certified to by the contracting officer to have been actually sustained (including settlements made with the written consent and approval of the contracting officer) by the contractor in performance of said work.

(i) Permit fees, deposits, royalties, and other similar items of expense incidental to the execution of this contract and necessarily incurred and specifically approved in advance by the contracting officer.

(j) Such proportion of the transportation, traveling, and hotel expenses of the officers, engineers, and other employees of the contractor as is actually incurred in connection with this work.

(k) Such other items as should, in the opinion of the contracting officer, be included in the cost of the work. Before such an item is allowed by the contracting officer, it shall have been specifically certified as being allowed under this paragraph.

(l) Such cost shall not include interest on capital or borrowed money nor charges for the use or occupancy of the contractor's property or facilities except as otherwise specifically herein provided.

STATE OF NEW YORK, *County of New York*:

I hereby certify that the following are correct extracts from the minutes of certain meetings of the board of directors of Alabama Power Co., at which said meetings there was present a quorum of the said board authorized to transact the business hereinafter described; that the proceedings of the said meetings were in accordance with the charter and by-laws of the company, and that the same have not been revoked, annulled, or amended in any manner whatsoever.

I further certify that I am the custodian of certain records of said company, including the minutes of meetings of the board of directors.

Special meeting held November 4, 1918.

On motion,

Resolved, That the president and vice president, or either of them, is separately authorized to sign and execute on behalf of this company any and all proposals which may be submitted and any contracts, bonds, or other documents relative to any work which is or may be awarded by the United States Government to this company, and also any contracts and bonds with the said Government concerning such work.

Annual meeting held March 11, 1918.

On motion duly made and seconded, the following officers of the company were elected to serve for the ensuing term and until their successors are elected and qualified:

James Mitchell, president; Thomas W. Martin, vice president; Wiley Alford, secretary; Wiley Alford, treasurer; H. S. Swan, assistant secretary; H. S. Swan, assistant treasurer; M. P. Randall, assistant secretary; M. P. Randall, assistant treasurer.

In witness whereof I have hereunto set my hand and affixed the corporate seal of the company the 7th day of November, A. D. 1918.

[SEAL.]

H. S. SWAN, *Assistant Secretary.*

NOVEMBER 9, 1918.

From: Lieut. Col. William Williams, Ordnance Department, United States Army.
To: Col. J. W. Joyes, Ordnance Department, United States Army, Chief of the Nitrate Division, Ordnance Office, through the Chief of Ordnance.
Subject: Designation of contracting officer under contract No. T-69. (Army No. 12385.)

1. You are hereby authorized to act in my stead as contracting officer for all purposes and in all respects contemplated by the contract dated the 1st day of December, 1917, between the Alabama Power Co. and the United States of America, by Lieut. Col. William Williams, Ordnance Department, United States Army.

WILLIAM WILLIAMS,
Lieutenant Colonel, Ordnance Department, U. S. Army,
Contracting Officer.

[First Indorsement.]

From: The Chief of Ordnance, United States Army, November 12, 1918, to Col. J. W. Joyes, Ordnance Department, United States Army.

1. In accordance with the terms of the above-mentioned contract, dated the 1st day of December, 1917, between the Alabama Power Co. and the United States of America, by Lieut. Col. William Williams, Ordnance Department, United States Army, therein designated as the contracting officer, you, as Chief of the Nitrate Division, Ordnance Office, and in the event of your relief from that position, your successor therein, are hereby designated to act as contracting officer thereunder in all respects and for all purposes contemplated by that contract.

C. C. WILLIAMS,
Major General, Chief of Ordnance, U. S. Army.

The CHAIRMAN. By reason of the specific language of the contract itself, you came to the conclusion that these separate contracts which were entered

into by the officers of the corporation, I imagine, and the Government of the United States, are absolutely void and of no effect.

Col. HULL. The options to purchase are nonenforceable unless ratified by Congress.

The CHAIRMAN. Will you go right ahead with your statement and state anything else you have to say about the matter?

Col. HULL. Another question that was before the office was the contract that we had between the General Chemical Co. and the United States relative to nitrate plant No. 1, the apparatus and the processes for nitrate plant No. 1. The opinion of the office is dated December 14, 1920. We answer a number of inquiries as to the rights of the Government as to the use of our properties. It relates primarily to patent rights.

The CHAIRMAN. Will you kindly insert that in the record? Who is that contract signed by, or was it signed?

Col. HULL. I have not that contract in front of me now. I can get that and insert it. It was a tender by the General Chemical Co., dated June 5, 1917, submitted by Mr. W. H. Nicholls, chairman of the board, and Mr. John A. Martin, secretary, and accepted on behalf of the President July 14, 1917, by Newton D. Baker.

The CHAIRMAN. Do you hold that that contract or that agreement comes in the same category as the agreements with the Alabama Power Co. and the Air Nitrates Corporation?

Col. HULL. No, sir; the question here was a limitation whereby the Government received the right to use certain patent processes and apparatus, together with all improvements in the art made, so long as the Government continued the use of the process, and the Government agreed to exclude the public from all works "in which said process shall be employed," etc.; in other words, to keep it secret, and we held that the obligation of secrecy had expired by reason of the fact that the contract was no longer recognized by the General Chemical Co. and whatever we had there was a matter of general information obtained from the other side, after the war, anyway.

The CHAIRMAN. Are those the only contracts you have respecting these matters?

Col. HULL. They are the only ones submitted, except the one of Mr. Ford's. On January 17 the Secretary of War called upon my office for a memorandum as to whether there was a mandate upon him to sell the Muscle Shoals nitrate plant, which I answered in a short memorandum that there was not, and that it was a matter for Congress, which I will also insert in the record.

(The memorandum referred to is as follows:)

JANUARY 17, 1922.

Memorandum for the Secretary of War.

Subject: Is there any mandate upon the Secretary of War to sell the Muscle Shoals nitrate plant?

The only statute authorizing the sale of manufacturing plants under the jurisdiction of the War Department is contained in the act of July 9, 1918 (40 Stat. 850), in the provision authorizing the President, through the head of any executive department, to sell war supplies, material, and equipment "and any building, plant, or factory acquired since April 6, 1917, including the lands upon which the plant or factory may be situated, for the production of such war supplies, materials, and equipment * * *"

This authority may be considered in the nature of, or equivalent to, a direction or mandate to sell war supplies, material, and equipment, and also manufacturing plants no longer needed for Government use, but does it apply to the Muscle Shoals nitrate plants? This question must be answered in the light of the provisions of section 124 of the national defense act of June 3, 1916 (39 Stat. 215), which authorized the President to cause to be constructed a nitrate plant, at some location to be determined by him after an investigation, for the manufacture of nitrate for military purposes in time of war and for fertilizers for agricultural purposes. There was appropriated the sum of \$20,000,000 therefor, this sum to be raised by the Secretary of the Treasury from the sale of Panama Canal bonds. Among other provisions of the section special attention is invited to the following:

"The plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital."

It is understood by this office that Muscle Shoals was selected by authority of the President as a site for the nitrate plant authorized by the national-defense act, and that Plant No. 1 and the Wilson Dam and certain other facilities have been paid for in part from the \$20,000,000 appropriated by the national-defense act. It appears that about \$18,000,000 has been expended from that appropriation, chiefly, however, for the construction of the Wilson Dam. It is understood that the land for the Nitrate Plant No. 1 was paid for from that appropriation, but the construction of Plant No. 1 and all expenses in connection with No. 2 were paid for from war appropriations for the Ordnance Department.

It thus appears that the Muscle Shoals nitrate project, considered as a whole, was initiated by Congress by the provisions of the national-defense act of June 3, 1916, and that a considerable portion of the expenditures for the plant have been made from the \$20,000,000 appropriated by that act.

In my opinion the general authority contained in the act of July 9, 1918, supra, for the sale of war supplies and plants acquired since April 6, 1917, does not apply to the Muscle Shoals project, considered as a whole. It is a rule of statutory construction that a general statute does not repeal or supersede a prior particular statute unless there is some express reference to the previous legislation on the subject, or unless there is a necessary inconsistency in the two acts standing together. *Ex parte Crow Dog*. (109 U. S. 558, 570.) I consider, therefore, that the special provision contained in section 124 of the national-defense act, directing that the plant therein authorized be operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital, is applicable to this plant as a whole and is a restraint upon its sale. The same statute would prevent the lease or rental of the plant for private operation.

J. A. HULL,
Acting Judge Advocate General.

[Second indorsement.]

WAR DEPARTMENT,
JUDGE ADVOCATE GENERAL'S OFFICE,
December 14, 1921.

TO THE ADJUTANT GENERAL OF THE ARMY:

1. By the preceding indorsement you refer to this office for opinion the questions set forth in subparagraphs (a) to (d), inclusive, of paragraph 4, and subparagraphs (a) to (f) of paragraph 5, of the letter of the Chief of Ordnance dated November 2, 1921. (00 160/20041.)

2. These questions relate to the contract between the General Chemical Co. and the United States, executed on July 14, 1917, whereby the Government received the right to use certain patented apparatus and processes therein described, together with all improvements in the art made or acquired by the General Chemical Co. at any time "so long as the Government shall continue the use of said processes." The authority for the contract appears to have been section 124 of the act of June 3, 1916 (39 Stat., 215). The patented processes mentioned in the agreement are embodied in patents Nos. 1141947, 1141948, 1142363, 1151537, 1159364, and 1159365, and the agreement contained no definite provisions for its termination.

3. A short time after the agreement was made the Government proceeded to build nitrate plant No. 1 at Sheffield, Ala., in accordance with the plans of the General Chemical Co., the first unit being completed in June, 1918. Thereafter trial operations were carried out in the above-mentioned unit with the assistance and under the instruction of the General Chemical Co. organization throughout the remaining months of the year of 1918. It became evident to those in charge about the latter part of December, 1918, that extensive changes in the plant would be necessary before it would operate successfully, and thereafter the personnel was reduced to the point of stand-by. Presumably on account of the armistice no immediate efforts were made to resume operations. However, extensive negotiations were carried on between the agents of the Government and those of the General Chemical Co., in which an agreement was attempted whereby the chemical company would take over the nitrate plant and resume the research. No agreement, however, was ever consummated between the parties. During the time the Government was operating the plant it had an understanding with all its officers and employees as follows:

"In consideration of my employment by the United States and its agreement to pay me for my services, and in consideration of my access through such employment to confidential information as to processes and apparatus used by or communicated to the United States, I agree that I will not divulge any information so gained without express written permission of the Secretary of War, or his duly appointed representatives, and that I will use my best efforts to prevent improper disclosures of any confidential information by others."

This agreement being between the Government and its employees was not shared by the contractor, the chemical company.

4. The Ordnance Department appears to have been still interested in the development and research incident to the Government experiments in the above-mentioned plant, for on August 13, 1919, Mr. A. E. Hecker, of the nitrate division, requested information from the General Chemical Co. as to the methods of manufacture and durability of catalysts No. 719, No. 698, and No. 744, in response to which request the General Chemical Co. on August 22, 1919, replied:

"In response to the request for information contained in your letter to us of the 13th instant, the writer is directed by the chairman of the board to advise you that, as this company is under no present obligation to furnish such information to your office, we must respectfully decline to do so."

Apparently having in mind the above-mentioned contract, Col. Burns, of the Ordnance Department, on September 8, 1919, requested by letter of the General Chemical Co. the reason for their refusal to give the information called for in the Hecker letter of August 13, and the chemical company replied by their letter of September 13, 1919, as follows:

"If, as we understand, your request for information was made pursuant to clause 4 of our tender of June 5, 1917, we need only to remind you that by the express terms of this clause our obligation to communicate improvement to the Government was limited to the period during which the Government should continue the use of our process and that the Government's plant for the use of that process has been shut down for nearly a year."

5. On June 6, 1919, a commission designated the "United States Fixed Nitrogen Commission" was sent to Europe to ascertain the development of nitration processes abroad. This board investigated the British, French, and German processes, and reported particularly on the German development, and their report show that the processes as covered by the patents of the General Chemical Co. were not only well known and understood, but that they had been extensively practiced for several years in Germany.

6. The agreement of July 14, 1917, contains no express provision for its termination other than the terms "so long as the Government shall continue to use said process," and "in which said processes shall be employed." The letter of August 22, 1919, in which the chemical company states "this company is under no present obligation to furnish such information to your office" would indicate that the chemical company believed that the contract was no longer in force. By the further information contained in the letter of September 13 the chemical company states that their refusal to give the information is upon the ground that the use of their process in the Government plant has been discontinued for more than a year and therefore fell outside the provision of paragraph 4 of the agreement to furnish information "so long as the Government shall continue the use of said processes." It appears that although the plant was shut down because the process as used under the advice and direction of the chemical company did not prove satisfactory, the Government agents carried on experiments and inquiry along that line with a view to determining an efficient method of obtaining the product desired. The plant having been placed in standby and so remaining for about a year, the question arises as to whether this was a discontinuance of the use of the process. The chemical company takes the stand the process has ceased to be used by the Government. This position implies that the contract is completed and has expired, because the only limitation on its life is governed by its terms, which include "so long as the Government shall continue to use said process," "exclude the public . . . from all works in which said processes shall be employed," etc. These terms appear in the contract where, had there been a definite time limit in the minds of the parties, it would have been set forth. It appears that the intentions of the parties were that the contract should govern as long as the Government made use of the process and no longer. The action by the chemical

company estops that company from taking the position that the process was merely temporarily discontinued.

7. The questions propounded by the Chief of Ordnance are set forth and answered seriatim:

(4a) Is the agreement of July 14, 1917, still in effect? Answer. The contract of July 14, 1917, may be considered as terminated as of the date of the discontinuance of the process by the Government.

(4b) Can the plant be sold as a going concern to parties desiring to develop it as a nitrogen fixation plant? Answer. Since it clearly appears that the plant was operated without success and later completely closed down due to the fact that operation resulted in a failure, it can not be said to be a going concern, and therefore could not legally be sold as such, and in the sale of the plant no further warranty should be given than a statement that it is sold "as is."

(4c) Can the equipment in the synthetic process be sold for removal from the reservation, without restriction as to its use? Answer. The subject matter of the contract was in process and apparatus, and the machinery installed is not shown to fall within those classes, and no restrictions being set forth as to its use, may be sold without restriction or reservation as to its use, and the future use of the plant by the purchaser as a plant for manufacturing the subject matter embodied in any patents would, of course, be a question between the purchaser and any patentee owning processes to be used.

(4d) Can the equipment used in the synthetic ammonia process be sold for use other than for nitrogen fixation, allowing prospective buyers to inspect the plant? Answer. Inasmuch as processes covered by the contract are no longer in operation or use by the Government, the prohibition relating to the exclusion of the public is no longer applicable, and the equipment, not being the subject matter of the contract, may be sold for whatever purposes the Government may see fit.

(5a) Can operations at Sheffield be described and published? Answer. The information received by the Government from the General Chemical Co. was the subject matter of the six patents, together with the knowledge and experience of the engineering force of the chemical company. It appears that at the outset the chemical company relied on the information of their engineers, Mr. De Jahn and Mr. Schultze but after several weeks' trial these gentlemen were replaced by others who had no experience with this type of project and who met with no greater success. It would appear that at the time the contract was made there were no other plants of this type in operation in this country, and that the chemical company had merely the patents and a theoretical idea as to the means of the operation, which means were intended to be worked out at the expense of the Government. The terms upon which the contract was undertaken clearly show that it was intended as an experiment, the chemical company giving services and theory as expressed in their patents and the Government financing the proposition in addition to giving the services of its employees. The subject matter set forth in the patents can be under no injunction of secrecy, because they are as a matter of law complete publications which may be discussed and criticized at will. Under the terms of the contract the Government agreed to "exclude the public from all works in which said processes shall be employed." The process being no longer in operation, the restriction as to the public appears to be terminated. The Government did not agree to any secrecy other than this clause and is now at liberty to give such information as it chooses. As to the agreement of secrecy between the Government and its employees, the General Chemical Co., not being a party to the agreement, has no authority to claim under it.

(5b) If not, can operations be described when these operations were carried out in exact accordance with published patents, or can it be published that operations described in patents were actually used at Sheffield? Answer: As to the information received by the Government and its employees as a result of experience and experiments carried on at Nitrate Plant No. 1, the only stipulation referring to this matter in the contract is that the General Chemical Co. receives an implied license to use such information. Information thus received belongs to the Government to do with as it sees fit. The rights thus obtained by the chemical company would be necessarily restricted to an implied license to the matter which would plainly not entitle it to restrict the publication of such information by the Government.

(5c) If not, can the principles involved in these operations and described in the patents and other literature be described if no reference is made to the fact that actual operation at Sheffield was in accordance with these principles?

Answer: As to the information received as the result of the inspection of the European plants by a board of officers, any information thus obtained would be clearly outside the contract, inasmuch as it was obtained after the cessation of operations at Plant No. 1, and therefore would preclude the chemical company from any interest therein.

(5d) Can the advantages and disadvantages of certain variants from the process described in the patents be discussed, even though such variants were used at Sheffield, provided no statement is made that they were actually used? For example, a discussion of the relative merits of pressures or temperatures higher or lower than those described in the patents. Answer: In the letter of October 3, 1921, the General Chemical Co. to Maj. Burns, Ordnance Department, the writer urged that the Government, under paragraph 5 of the contract of July 14, 1917, agreed to keep the designs and processes secret. Examination of this paragraph cited shows that the Government agreed to recognize the chemical company as the sole owner of the processes under the patent, and further agreed to exclude the public from the works in which said processes shall be employed. This office can not agree with the position taken by the chemical company as to its construction of the prohibition, and, on the other hand, is of the opinion that all powers of this paragraph were terminated upon the cessation of the use of the processes.

(5e) If certain information was obtained by the Government during the operation of the Sheffield plant and was subsequently obtained from the British Ministry of Munitions or by inspection of the German synthetic ammonia plants, can this be published if no reference is made to Sheffield? Answer: Yes.

(5f) There have been researches on problems that arose at Sheffield, and others, the outgrowth of collateral researches, on problems which have arisen since the operation at Sheffield and which are entirely distinct from the operation of that plant but which might be construed to be indirectly the result of knowledge acquired during the operation at Sheffield. To what extent can the results of this research work be described and published? Answer: The contract under consideration can place no restrictions upon the Government as to disclosure of information resulting from its independent researches, even though the original reason for such research arose out of operations at Sheffield, and the publication of such information is purely a matter of departmental determination as the interests of the Government may appear.

J. A. HULL,

Acting Judge Advocate General.

The CHAIRMAN. Col. Hull, were you present before the committee, or in the committee room, when Gen. Williams stated that in his opinion there was a moral obligation on the part of the Government to recognize the validity of the Alabama Power contract?

Col. HULL. Yes, sir.

The CHAIRMAN. What do you think about that moral obligation?

Col. HULL. Ordinarily, I am strictly in favor of the Government carrying out its contracts that are duly entered into, notwithstanding that the officer, in the time of emergency, exceeded his powers. But in this contract I notice it is a cost-plus contract. It is a long contract that bears many evidences of having been very carefully prepared by the attorneys for the company, and they have provided several very remarkable things, namely, the construction of a power-transmission line and power plant at the expense of the United States, but at the same time providing that the company takes the real estate and an option. The company can not get, ordinarily, in time of war, the right of way as cheaply or as expeditiously as the Government can, and it certainly would have been a matter of ordinary business sense when they were constructing a plant and buying real estate to do it in that way. Therefore, I believe it is a proper case to leave to Congress, after a due investigation, to determine what the equities of the matter may be.

The CHAIRMAN. You are not greatly impressed, I take it, with the moral obligation?

Col. HULL. I do not know the nature of the negotiations that lead up to that contract, but they had a profit of about \$285,000 on the face of the contract, for the construction.

The CHAIRMAN. For the construction of the transmission line?

Col. HULL. And the properties there which were constructed.

The CHAIRMAN. Is there anything else you want to explain to the committee regarding these contracts?

Col. HULL. The contract with Mr. Ford was prepared in my office; that is, the proposal of Mr. Ford, after an interview with Secretary Weeks. The Secretary of War and Mr. Ford wanted it expressed in a little more legal language, and it was drafted in my office. Several of my best assistants worked a couple of weeks on it with Mr. Ford's representatives to try to express Mr. Ford's idea. It was not a negotiation in my office. The contract which he sent here was the result of that drafting in the office.

The CHAIRMAN. Do you mean the signed contract of January 25, 1922?

Col. HULL. Yes, sir. But we were acting there more as a drafting agency for Mr. Ford than negotiating across the table.

Mr. Fields was asking some questions on which I might throw a little more light. If you will turn to page 15 of the contract, section 3, in regard to the flowage lands and rights, you will find the following language, after 4 per cent: "Of the actual cost of acquiring lands and flowage rights, and of completing the locks, dam, and power-house facilities (but not including expenditures and obligations incurred prior to approval of this proposal by Congress)."

Similar language was also in the draft as it left the office. In section 7, but before signing it was stricken out, which causes a certain amount of misunderstanding. I understood that what Mr. Ford was afraid of was that that would obligate him to get that land, and, being a private party, he was afraid he would have difficulty in condemnation proceedings, whereas the Government could condemn. But the omission leaves it in question, and I believe you will find that his representatives, who will appear before you next week, will clear that up to the satisfaction of the committee.

The CHAIRMAN. Of course, the experience of this committee has shown conclusively that when the Government tries to negotiate for land the value goes up enormously.

Col. HULL. Of course, it is liable to go up even still more in the case of a private individual.

The CHAIRMAN. I believe it would also go up if a very wealthy man like Mr. Ford were known to be in the market for the purchase of real estate.

Col. HULL. Of course, the Government is protected by the right of eminent domain.

The CHAIRMAN. But I find that juries generally, when you go into court on condemnation proceedings, are more apt to save the private citizen than to save the Government.

Col. HULL. I would have recommended to the Secretary of War, if funds had been available, that condemnation proceedings start at once on the Alabama Power Co. property, so that that could be completely disposed of before we attempted to sell it. But there were no funds available, so there has been no authority given to start condemnation proceedings.

There has been a great number of legal questions which have arisen around this table, and I will be willing to answer those questions as far as I can. I do not recall just what they were. What I have mentioned are the principal questions that have been in the office.

The CHAIRMAN. By the by, I heard it stated that there is a rumor around that quite a number of private corporations and private individuals own considerable land around Muscle Shoals, and that if any effort is made to secure those lands there will be a pretty big increase in the value. Have you heard anything of that kind?

Col. HULL. I have not heard anything. Those stories were likewise told in Washington when the Union Station was started, I believe.

The CHAIRMAN. Oh, yes. We have those things all over the country. What have you to say regarding this language in the Secretary's report, on page 5: "The Acting Judge Advocate General has also held that the provision contained in section 124 of the national defense act directing that the plants therein authorized be operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital, is applicable to the plant as a whole, and is a restraint upon its sale. This construction, if justified, would prevent the lease or rental of the plant for private operation." What have you to say in regard to that?

Col. HULL. Section 124 of the national defense act, which I read a while ago, Mr. Chairman, I think is clear and unambiguous, and consequently the Secretary of War is without power to dispose of these properties until authorized by Congress.

The CHAIRMAN. You feel that if Congress were to authorize the sale and the lease of the land involved in the Muscle Shoals plant, that would settle the whole controversy?

Col. HULL. It is entirely a question for Congress.

Mr. HULL. Colonel, you spoke of the contract with the General Chemical Co. in connection with patent rights and royalties. Is it your opinion that we are not under any obligations under that contract?

Col. HULL. That contract with the General Chemical Co. has practically terminated. That is on nitrate plant No. 1.

Mr. HULL. Would there be any on nitrate plant No. 2?

Col. HULL. On nitrate plant No. 2 we have a number of processes and patents which, under the contract we have, we could transfer, and which, under this contract with Mr. Ford, he has an option on. Whether he will take them or not depends upon his investigation. If he does take them and produces any nitrate there, under these patents he must pay a royalty.

Mr. HULL. Then, under the contract with Mr. Ford, we would have to pay that royalty. Would that money be charged against the contract with Mr. Ford?

Col. HULL. If he took over those patent rights that royalty would be a part of the cost of the nitrate and of the fertilizer which he would produce there.

Mr. HULL. If we accept this contract with Mr. Ford, does that leave us free of any contract or liability with any other company?

Col. HULL. I should say so.

Mr. HULL. You had something to do, as I understand it, with the drafting of this contract?

Col. HULL. It was drafted in the office.

Mr. HULL. Then, I presume you know something about the liability of Mr. Ford under that contract?

Col. HULL. Yes sir; it has been studied.

Mr. HULL. Would he be bound to produce fertilizer under that contract, if it was found possible.

Col. HULL. As now drafted?

Mr. HULL. As now drafted he would have to produce at least—

Col. HULL. (interposing). To the maximum capacity of plant No. 2.

Mr. HULL. There would not be any question about that?

Col. HULL. There is not any in my mind.

The CHAIRMAN. Under what section?

Col. HULL. Section 14.

Mr. HULL. Suppose he could not produce it; that it was found physically impossible to produce the fertilizer compound in paying quantities; what would be the result, so far as the contract with the Government goes?

Col. HULL. If the Government insists, a court of equity would grant relief, and not compel the performance of the impossible.

Mr. HULL. What section of the second contract with Mr. Ford covers that?

Col. HULL. Section 14.

Mr. HULL. If it was found impossible to produce this fertilizer, I presume of course he would be enabled to take the hydroelectric power that was supposed to go into the production of the fertilizer and use it or sell it as he saw fit?

Col. HULL. Yes; but, of course, he would be obligated to maintain his laboratory and experiments and try to produce.

Mr. HULL. He would have to keep experimenting and trying to produce fertilizer?

Col. HULL. Yes, sir.

Mr. HULL. Under this contract there is nothing, as I understand it at the present time at least to guarantee the fulfillment of the contract except the personal guaranty of Henry Ford, and of course he binds his estate to carry it out. What is your opinion as to the liability of the estate? I have not any doubt about the liability of Henry Ford, but what would be the liability of the estate? Can he make his estate liable?

Col. HULL. He could make his estate liable and the estate would be bound under the existing law—that is, the estate in Michigan where he signs this contract. There are two sections of the statute in Michigan to which my attention has been called which I would like to read to you. I quote from the compiled laws of Michigan of 1915 (vol. 3, p. 4867):

"(13898) SEC. 16. If the court shall be satisfied from the report of the commissioners or by the proof exhibited, said court may order the executor or administrator to retain in his hands sufficient estate to pay such contingent claim when the same shall become absolute, or if the estate shall be insolvent sufficient to pay a proportion equal to the dividends of the other creditors."

Following a little later down you find this:

"(13905) Sec. 23. When the heirs, devisees, or legatees shall have received real or personal estate and shall be liable for any debts as mentioned in this chapter they shall be liable in proportion to the estate they may have respectively received, and the creditor may have any proper action at suit or in law or equity and shall have a right to recover his claim against a part or all of such heirs, devisees, or legatees to the amount of the estate they may have respectively received, but no such action shall be maintained unless commenced within one year from the time the claim shall be allowed or established."

Of course there is one obvious difficulty in that, and that is if he should breach the contract on a question of production of fertilizer for the Government to maintain a suit for damages it would have to show that the Government was damaged because the farmers of the country did not receive fertilizer at a cheap rate. I will leave it to the lawyers on this committee as to how difficult it would be to secure a measure of that in dollars and cents. Of course we can compel specific performance, but as long as Mr. Ford is alive I do not think that would be necessary.

Mr. HULL. Under this contract Henry Ford obligates himself and his company to start to develop certain properties down there. Unquestionably there would be considerable property that would be worth something to the Government. Would there be any question at all, or could there be any question, raised in case Henry Ford failed to carry out the contract as to whether that property would revert to the Government? That is the property he puts on our property down there.

Col. HULL. He does not contract to put any property on land that is to remain in the United States, so that anything we could hold would have to be held after judgment.

Mr. HULL. There would be more property there on which we could recover?

Col. HULL. I should say we would have to hold it after judgment, but we could not hold it otherwise.

Mr. HULL. We would have a cause for damages against the company?

Col. HULL. If there was a breach on which you could recover damages, the property of the company would be subject to execution?

Mr. HULL. I do not know whether you would care to do so—

Col. HULL. (Interposed.) I presume your suggestion is in regard to the possibility of the insertion of a clause returning to us the properties we dispose of in case of a breach?

Mr. HULL. There is no such clause in there now.

Col. HULL. No such clause there now.

Mr. HULL. Should there be?

Col. HULL. It would be an additional protection to the United States.

Mr. HULL. They should not object to putting it in, should they?

Col. HULL. I have given it no consideration at all along that line.

Mr. HULL. Do you care to express to the committee a general conclusion in regard to this contract, anything that would be of interest to the committee?

Col. HULL. I have never given the business features of it any real consideration, except in hearing the testimony which has been given the committee.

Mr. HULL. You have heard a good deal of testimony?

Col. HULL. I have simply the information that the other members of the committee have had, and I would not consider, without further evidence, that I would be able to arrive at any definite conclusion.

Mr. JAMES. Colonel, under the contract entered into by the Alabama Power Co. with the United States, how much money was invested by the United States?

Col. HULL. About \$4,676,000, I think.

Mr. JAMES. How much was invested by the Alabama Power Co.?

Col. HULL. I have no knowledge of that.

Mr. JAMES. Have you any idea what profit they made?

Col. HULL. The contract provided for \$30,000 for overhead; also 6 per cent profit on the expenditure, with a limit of \$225,000.

Mr. JAMES. Under the contract between the United States and the Air Nitrates Corporation, how much money was invested by the United States?

Col. HULL. The total cost was \$25,000,000, approximately \$70,000,000.

Mr. JAMES. How much money did the Air Nitrates Corporation invest?

Col. HULL. It was a cost-plus contract.

Mr. JAMES. At what rate?

Col. HULL. Article 10 of the contract of the American Air Nitrates Corporation with the United States provides:

"Costs and expenses—Audit and payment thereof.—The United States shall bear all costs and expenses of every character and description incurred or made in connection with the planning, construction, equipment, and operation of each of the said plants or any part thereof, and in the conduct of any other business or activities of the agent hereunder; and the United States shall supply all money necessary therefor in such amounts and in such manner as to permit all of the agent's activities with respect to the planning, construction, equipment, and operation of the plants to proceed without delays or interruptions and without the necessity of the agent providing any capital or borrowing any moneys. Vouchers for all accounts payable shall from time to time be furnished to the Chief of Ordnance, and upon presentation of satisfactory evidence he shall either furnish the agent funds to the amounts thereof, which funds shall be immediately paid out by the agent under the supervision of a representative of the Chief of Ordnance, or the vouchers may be paid direct by the Chief of Ordnance to the persons entitled to payment thereunder. Such vouchers shall be acted upon by the Chief of Ordnance promptly.

"All accounts payable by the United States hereunder, including those in relation to costs and expenses of construction or operation, shall be subject to audit by the United States, which shall maintain at the plants and elsewhere, if necessary, a sufficient number of auditors promptly to audit the same.

"To expedite payments to the agent the United States shall detail representatives at each of the said plants and at the agent's home office, with power and sufficient funds to discharge the pay rolls and to make any other payments as they shall become due hereunder. Payments by the United States shall be subject to correction for errors, if any.

"The agent shall make no charge to the United States for the following things:

"1. For procuring from the American Cyanamid Co. a license to it as agent of the United States to use the said company's patents and processes.

"2. For procuring from the American Cyanamid Co. the disposal, for purposes of the Air Nitrates Corporation, of the said company's experiences, records, and plans appertaining to the production of the said chemicals hereinabove referred to.

"3. For procuring from the American Cyanamid Co. the disposal, for the purposes of the Air Nitrates Corporation, of the following members of the said company's executive and technical force, namely, the President, vice president and general manager, sales and traffic manager, engineering assistant to general manager, superintendent of manufacture, chief technologist, chief engineer, assistant engineer, and, in addition thereto, in connection with the operation of the said plants, two principal works managers, as such offices may from time to time be filled.

"4. For procuring from the American Cyanamid Co. the disposal, for the purposes of the Air Nitrates Corporation, of all of the said company's plants for the purpose of training superintendents, foremen, and chief operatives."

Article XI provides:

"Agent's compensation.—As full compensation for the services of the agent the United States shall pay to the agent the following fees:

"1. *Construction fee.*—Three and one-third ($3\frac{1}{3}$) per cent of the cost in connection with the construction and equipment of the said plants, until such cost (exclusive of the agent's compensation) shall equal thirty million (\$30,000,000) dollars, and thereafter one and two-thirds ($1\frac{2}{3}$) per cent of such cost in excess of said thirty million (\$30,000,000) dollars. Said fee shall be payable monthly upon that portion of the cost for which payment has been made during the month or months preceding and as to which the fee is unpaid. There shall be credited on account of said construction fee any payments for construction compensation heretofore made to the agent under the provisions of said contract of November 16, 1917. The total of the construction fee shall not exceed one million five hundred thousand (\$1,500,000) dollars.

"2. *Operation fee.*—One-quarter of one cent (\$.00025) per pound of ammonium nitrate produced in compliance with Article VII hereof and accepted or utilized by the United States, up to and including 110,000 tons produced in any fiscal year of the United States, and one-eighth of one cent (\$.000125) per pound of ammonium nitrate so produced and accepted or utilized in any fiscal year in excess of such 110,000 tons. Payment shall be made monthly.

"The Chief of Ordnance may direct the agent to produce, at any one or more of said plants, products other than ammonium nitrate, and to the extent that

such products are not utilized in the making of ammonium nitrate in any of said plants operated by the agent the agent shall receive as compensation for making such products an operation fee computed upon such a basis as will give the agent for making such products the same amount as the agent, by way of operation fee, would have received (1) where such products are nitrogenous compounds, for fixing an equivalent amount of nitrogen in the form of ammonium nitrate; and (2) where such products are other than nitrogenous compounds, for making ammonium nitrate equivalent in cost to that of such products."

Mr. JAMES. Is Lieut. Col. William Williams still in the Army?

Col. HULL. No, sir; I think not.

Mr. JAMES. Do you know what his present business is?

Col. HULL. I am informed that he is living in New York and just recently left for the Orient.

Mr. JAMES. Do you know what his business is?

Col. HULL. I do not.

Mr. JAMES. Is Lieut. Col. Samuel McRoberts still in the Army?

Col. HULL. No, sir.

Mr. JAMES. Do you know what business he is in?

Col. HULL. He is in the National City Bank, I believe.

Mr. JAMES. He is a banker?

Col. HULL. Yes, sir.

Mr. JAMES. I understood you to say that Lieut. Col. Williams, who signed this contract on behalf of the United States with the Alabama Power Co., and Lieut. Col. McRoberts, who signed the contract on behalf of the United States with the Air Nitrates Corporation, are out of the Army?

Col. HULL. Yes, sir.

Mr. KEARNS. Colonel, do you know what the capital stock of the Air Nitrates Corporation amounted to? Is it not true that that was a company composed of 10 men and each one put \$100 into the organization?

Col. HULL. I have so heard, but I have never looked into that matter.

Mr. KEARNS. If this was a company composed of 10 men, each putting in the company \$100, making the capital stock \$1,000, what business or activity could they have that the Government would want to buy?

Col. HULL. Possibly the relationship of the Air Nitrates Corporation with the parent company, the American Cyanamid Co., might explain why they made a separate company for the purpose of the contract.

Mr. KEARNS. I have been told—I do not know how true it is—that these 10 men got from the Government or got from some one, something over \$2,000,000 on a capital stock of \$1,000 out of this project at Muscle Shoals. Is that true?

Col. HULL. I do not know. I have heard a great many stories on both sides of that, but I have never had occasion to go into it officially.

Mr. KEARNS. I was wondering how a company with a capital stock of \$1,000 could furnish the Government anything in the way of materials that would be worth over \$2,000,000. Do you know of any service that they have rendered to the Government that would justify a payment of \$2,000,000?

Col. HULL. I do not know enough about the business to pass any intelligent judgment on that at this time. I could imagine a condition—for instance, if you take the 10 leading men of the United States Steel Corporation and they would start a small corporation for the purpose of helping us out in the construction of steel for a couple of years; their experience might be worth a good deal, considering Mr. Carnegie's old statement that he did not care whether his mills burned down as long as he had his personnel.

Mr. MILLER. Colonel, under section 15 of this contract, which might be called the advertising section of it, you find this peculiar language: "In order that the farmers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it shall make in the manufacture and sale of fertilizer products at nitrate plant No. 2 shall not exceed 8 per cent of the actual annual cost of production thereof. In order that this provision may be carried out, the company agrees to the creation of a board of not more than nine voting members, chosen as follows: The three (3) leading representative farm organizations, national in fact, namely: The American Farm Bureau Federation, the National Grange, the Farmers Education and Cooperative Union of America (or their successors) shall each designate not more than seven (7) candidates for said board. The President shall nominate for membership on this board not more than seven (7) of these candidates, selected to give representation to each of the above-mentioned organizations, said nominations to be made subject to confirmation

by the Senate, and there shall be two voting members of said board selected by the company. A representative of the Bureau of Markets, Department of Agriculture (or its legal successor), to be appointed by the President, shall also be a member of the board serving in an advisory capacity without the right to vote. The said board shall determine what has been the cost of manufacture and sale of fertilizer products and the price which has been charged therefor, and if necessary for the purpose of limiting the annual profit to 8 per cent (8 per cent) as aforesaid, shall regulate the price at which said fertilizer may be sold by the company. For these purposes said board shall have access to the books and records of the company at any reasonable time. The said board shall also determine the equitable territorial distribution of fertilizer products produced at nitrate plant No. 2. If and when said board can not agree upon its findings and determinations, then the points of disagreement shall be referred to the Federal Trade Commission (or its legal successor) for arbitration and settlement, and the decision of said commission in such cases shall be final and binding upon the board."

Do you construe that section of the contract to mean that Mr. Ford is obligated to follow his product until it reaches the farmer?

Col. HULL. No, sir.

Mr. MILLER. Then, that is idle phraseology in the contract?

Col. HULL. No; it limits the profit of the manufacturer but not the profit of the middleman.

Mr. MILLER. I am asking you, Colonel, whether that makes it obligatory on Mr. Ford or upon his company to follow their manufactured product until it reaches the hands of the farmer?

Col. HULL. I believe it would be left entirely to the discretion of the board, and that you could not force anything by the terms of this contract.

Mr. MILLER. What board do you speak of?

Col. HULL. The board provided for in section 15.

Mr. MILLER. Then, that is of no more binding force upon Mr. Ford than phraseology something like this: "In order that commercial fertilizer may be made at fair prices, without excessive profits, the company agrees that the maximum net profit which it shall make out of the manufacture and sale of fertilizer and fertilizer products at nitrate plant No. 2 shall not exceed 8 per cent per annum."

Col. HULL. On the actual cost of production. You are just changing the preamble.

Mr. MILLER. I have left out that portion of the phraseology in here, "in order that farmers may be supplied."

Col. HULL. Yes.

Mr. MILLER. It means nothing more than if the word "farmers" was not in there.

Col. HULL. It is a declaration only.

Mr. MILLER. Now, Colonel, read section 15, where it makes use of the language, "In order that farmers may be supplied with fertilizer," and see if that is substantially the same language that is repeated in section 17 of Mr. Ford's offer, which reads in this way:

"In order that said company may be supplied with electric power and the farmers with fertilizers after the termination of the said 100-year leases, should the United States elect not to operate said power plants," does not this contract convey all the way through it that Mr. Ford's product shall be sold directly to the farmer, and that he shall follow his product until it reaches the hands of the farmer?

Col. HULL. I understand that that clause, 15, was prepared by some farm organization and inserted almost in the words that they asked.

Mr. MILLER. What farm organization was that?

Col. HULL. I think they were the ones that were named in the clause, the American Farm Bureau Federation, the National Grange, and the Farmers' Educational and Cooperative Union of America.

Mr. MILLER. I am reading from this contract.

Col. HULL. I am reading from the contract, too. They are mentioned in paragraph 15. Their representatives drafted that clause and it was put in in that way. I see your point. I should say that under the terms of the contract, as far as the Government and Mr. Ford are concerned, it limits it only to the price to the manufacturer and does not provide that the Government should control how it should be disposed of to the farmer or to other industries.

Mr. MILLER. There is no effort in here to have the Government do anything. Mr. Ford is to do it all, or rather Mr. Ford's company, and what I am getting at is this, does Mr. Ford or his company obligate himself to get this manufactured product, which is commercial fertilizer, into the hands of the farmer?

Col. HULL. Not to the United States. It does not so obligate itself in this contract.

Mr. MILLER. Then Mr. Ford, after he manufactured his fertilizer, could dispose of it to anyone?

Col. HULL. Subject to the control of the board which is here set up.

Mr. MILLER. He could sell it to a purchasing concern or sell it through any other means that he might organize or anyone might organize to take the output of his factory?

Col. HULL. Yes, sir.

Mr. MILLER. And all the limitations that he and his purchaser would be under would be that Mr. Ford's profit should not exceed 8 per cent?

Col. HULL. Yes, sir.

Mr. MILLER. Then it would be possible under this contract, so far as the immediate effect to the farmer is concerned, for his product to go through one or more hands before it reaches the farmers?

Col. HULL. Yes, sir.

Mr. MILLER. And each one could take his slice out of the profits, but Mr. Ford himself could not get more than 8 per cent?

Col. HULL. That is correct. The matter is covered by the creation of a board to control.

Mr. MILLER. They control the profit Mr. Ford is to get, do they not?

Col. HULL. They control the price.

Mr. MILLER. I understand that. I have read the section about the board, and what I am getting at is that Mr. Ford shall not make over 8 per cent out of his commercial fertilizer, but after it gets beyond Mr. Ford's hands, suppose some one should organize a purchasing corporation and purchase Mr. Ford's output, what is there standing between that company and the farmer?

Col. HULL. The right of the board to determine the equitable territorial distribution of fertilizer products at nitrate plant No. 2.

Mr. MILLER. Suppose that your board should distribute, let us say, so much of this product to the State of North Carolina and so much to the State of Tennessee and so much to Kentucky and to other States or other lesser divisions than a State and say that they are entitled to so much of this output, your board can control the quantity produced for each one of those localities, but what check has it on the price that the farmer shall pay in each one of those localities?

Col. HULL. None.

Mr. MILLER. None whatever, has it?

Col. HULL. Not that I can see.

Mr. MILLER. In other words, there is nothing in this contract, Colonel, that controls the price of fertilizer as it shall reach the farmer, and that is what we are after in this matter; that is the whole undertaking, to get cheap fertilizer into the hands of the farmer. Now, would it not be salutary in this case—I am in deep sympathy with cheap fertilizer and I will go the limit to get cheap fertilizer to the farmer, but should there not be some clause in this contract by which Mr. Ford or his company have control of this product until it shall reach the very hands of the people who will consume the product, if we want to safeguard it and get a cheap fertilizer to the farmers?

Col. HULL. All I can say as to that is that the farm organizations that were primarily concerned did not have any fear of that kind.

Mr. MILLER. That is true, but there will be many farm organizations come and go.

Col. HULL. After you have raised the question, they are more concerned with it—

Mr. MILLER (interposing). This is a 100-year contract, and many farm organizations will come and go like the bubbles on the waters, just as they have in the last 50 years, or 20 years, or 10 years, and we are dealing here with something that is almost in perpetuity, five generations ahead of us, and if we are going to do anything, which is our earnest endeavor, to increase the productiveness of the soil and help the farmer, should we not have something of a permanent character in this contract rather than to leave it to the associations of farm organizations, as they come and go every year, dealing with this matter?

Col. HULL. Any clause of that kind, I believe, would be acceptable to the representatives of the company that will appear before you next week, if it can be so drafted.

Mr. MILLER. Was there any suggestion of a clause of that character in your draft?

Col. HULL. No, sir. This clause was not drafted in the office. It was adopted.

Mr. MILLER. We have a clause that will insure to the farmer the production of this plant at not to exceed 8 per cent profit to the manufacturer at the works. We have that safeguarded in this contract. Now, from there on, until it reaches the farmer, there is nothing here in this contract, and what I was thinking of was some clause by which it shall reach the hands of the farmers at a fair and reasonable price.

Col. HULL. If a fair clause of that kind could be drafted, I believe that the insertion of such a reservation would not meet with opposition. Of course, you can find that out next week.

Mr. MILLER. What I am alarmed about in this contract, and I am frank to say it right now, is that if the production of fertilizer in Mr. Ford's enterprise or his company's enterprise should become a formidable competitor with the very substantial interests now engaged in the sale of fertilizer, a purchasing company may be organized for the purpose of purchasing the output of this factory and get hold of that output, even though distributed in zones as the contract calls for; because this board has no control over prices. We want to keep that in our minds clearly. They could purchase the output of this factory, husband it, and dispense it as they pleased, or send it to these zones, just as they pleased, and put the prices to the farmer up equal to what Mr. Commercial Fertilizerman gets for his fertilizer now.

Col. HULL. If a clause of that kind can not be drafted, I should imagine that a criminal statute could be drafted that would meet such a condition.

Mr. MILLER. Under what law have you in mind that a criminal statute could be so drawn?

Col. HULL. The interstate commerce clause.

Mr. MILLER. Does that control the price of anything? Take, for instance, the 10 men who organized this Air Nitrates Corporation, which is probably a subsidiary corporation. I think it would be wise to safeguard these things, because what we are deeply concerned in and what I think we are all in sympathy with is that if the Government embarks on this enterprise and puts in this enormous sum of money, \$50,000,000 in addition to the \$105,000,000 and over that it has now invested there, making in round numbers \$160,000,000 that the Government has put in these plants, we are deeply concerned that the agricultural interests shall get the benefit of this whole thing, and that some cunning and clever manipulating company shall not get this thing in a condition so that they can control ultimately the output of this enterprise and set the price.

Col. HULL. That is the first time that idea has been expressed.

Mr. MILLER. It occurred to me from an examination of the contract. I have not had the time to devote as much time as I would like to it.

Col. HULL. If it had arisen it would have been more fully covered, I have no doubt, in this contract.

Mr. MILLER. I think it is very, very important.

Mr. PARKER. Col. Hull, if it should turn out to cost more to manufacture sulphate of ammonia at this plant than the market price at which sulphate of ammonia is produced and sold by others, would the manufacture go on; is there anything to insure that it would go on?

Col. HULL. Only as found in section 14. He obligates himself to manufacture at maximum capacity barring strikes and other causes.

Mr. PARKER. And other unforeseen causes, is it not?

Col. HULL. Other causes beyond his control.

Mr. PARKER. Is not the price of the market beyond his control?

Col. HULL. I should say that would come under the *ejusdem generis* rule, and the price would not be one of the causes.

Mr. PARKER. Do you think he would have to manufacture at a loss and sell it at a loss if he could not make it for the price at which it was sold on the market?

Col. HULL. One construction of that clause would do it, whether you could compel it or not.

Mr. PARKER. At any rate, it is a matter of doubt?

Col. HULL. It would be a serious matter of doubt.

Mr. PARKER. Then it is a serious matter of doubt whether he would have to go on and have to dispose of the goods at a loss if the market price was below what he could make it for?

Col. HULL. He would have to do it unless relieved either by Congress or a court of equity.

Mr. PARKER. But is says, "other cause beyond his control," and the price of the goods on the market would be beyond his control?

Col. HULL. As I said, in my judgment, the courts would not hold that price would be "other causes beyond his control."

Mr. PARKER. You think not?

Col. HULL. No, sir.

Mr. PARKER. But it is a serious matter of doubt, anyhow?

Col. HULL. No; I should say that the difficulty would have to be somewhat of a nature of those already specified.

Mr. PARKER. You think, then, he would be bound to go ahead and manufacture at a loss, under this contract, and sell at a loss, no matter how low the price of commercial sulphate of ammonia might be on the market?

Col. HULL. Unless relieved by a court of equity or by Congress. That is his obligation as it is written.

Mr. PARKER. This contract is simply a contract, is it not? It is not a mortgage or anything of that sort, but is a contract to manufacture?

Col. HULL. Yes, sir.

Mr. PARKER. Under clause 13 he is to get a deed for all this property, including the nitrate works, free and unencumbered, is he not?

Col. HULL. Yes, sir.

Mr. PARKER. He could then mortgage it to raise money?

Col. HULL. Yes, sir.

Mr. PARKER. That would create a lien on the property?

Col. HULL. Yes, sir.

Mr. PARKER. And that would be paramount to any mere contracts that he had made?

Col. HULL. Probably, without a reservation in the deed.

Mr. PARKER. So that unless there is a reservation in the deed, which is not provided for in this contract here, he could mortgage the whole plant for millions of dollars, as big companies do, and that would be prior to the obligations of this contract or the lien of this contract?

Col. HULL. The contract being made in the nature of a statute, the mortgagor would be bound by a knowledge of the terms of this contract.

Mr. PARKER. But this contract is very specific, that he shall get a title which is free and unencumbered, and that means free and unencumbered of anything and ready to mortgage.

It is a pretty easy matter to get up a strike by lowering wages, is it not?

Col. HULL. I think the committee has had very wide experience and is perfectly competent to judge that.

Mr. PARKER. If Mr. Ford lowered wages, he would have a strike and would be perfectly protected under this strike clause, would he not?

Col. HULL. I doubt it. A man can seldom profit by his own wrongs.

Mr. PARKER. But how can you find out that it is his own wrong, if he says that he has to lower them in order to meet market prices?

Col. HULL. I think both the points you are making are well worth discussion.

Mr. PARKER. That is what I think, and that is all I want to ask about that. I will now pass to the Alabama contract. Have you that contract with you? I have not seen it and I do not think it has been read and I want to look at it.

Col. HULL. Yes, sir.

Mr. PARKER. This Alabama Power Co. contract was one for the construction of a power plant and transmission line, was it not?

Col. HULL. Yes, sir; there are four or five projects. I have forgotten now exactly how many projects were combined in that one contract.

Mr. PARKER. Did some of these lands on which this was done already belong to the Alabama Power Co.?

Col. HULL. I think one parcel belonged to them.

Mr. PARKER. Was the one on which the power plant was built?

Col. HULL. Yes, sir.

Mr. PARKER. And that is the important one where almost all the money was spent, on their own lands.

Col. HULL. I do not know as to that.

Mr. PARKER. Is not the parcel on which most of the money was spent? It certainly can not be true that the transmission line cost more than the construction of the plant.

Col. HULL. Looking at page 20 of the Secretary's letter we find that the generating plants (Warrior) cost \$3,300,000; Warrior substation, \$384,000; Drifton railroad, \$90,000; Warrior-Muscle Shoals transmission line, \$805,000, so that the great percentage of the expenditure was made on the lands which I understand they already owned.

Mr. PARKER. Were the other lands that were bought paid for by the United States or were they paid for by the company?

Col. HULL. I understand that under the terms of the contract they were paid for by the company.

Mr. PARKER. The United States did not pay for the other lands, then?

Col. HULL. I presume not, sir. If it did, we would own them.

Mr. PARKER. I want to know whether they paid for them or not.

Col. HULL. Under the terms of the contract they were to be purchased by the company at their expense.

Mr. PARKER. At their own expense?

Col. HULL. Yes, sir.

Mr. PARKER. So that this was a contract then to place a lot of transmission lines and power plants on lands owned or to be owned and bought by the company at their own expense?

Col. HULL. Yes, sir.

Mr. PARKER. That contract, I understand you to hold, is void because of illegality so that it can not be enforced by either party against the other.

Col. HULL. I hold that the clause in the contract that provides for the option to purchase is void for lack of authority.

Mr. PARKER. That clause, however, is part of the essential consideration of the contract or part of the consideration, and would therefore render the whole contract void. It is an essential part of the contract, is it not?

Col. HULL. I do not think so.

Mr. PARKER. It is a part of the consideration which the United States was to pay this company, is it not?

Col. HULL. The rest of it has been executed.

Mr. PARKER. If the United States had put it in this form: "The United States agrees with the Alabama company that they shall have the right to use the Alabama company's lands during the war and during the need for it," putting on what property they pleased for which the Alabama company would pay them when they ceased using these improvements, that would be in the nature of a lease or a contract for something to be done on another person's land, limited in time, and in spite of the part which provides for a sale of these improvements, that was the substantial agreement, was it not, that the United States should have the right to put improvements in the nature of power plants and transmission lines on the Alabama Power Co.'s lands and get the use of those things during the war, and when they gave us that use, which they were bound to do and which the other company was bound to ask them to do, the company should pay them the value of those improvements; is not that substantially the contract?

Col. HULL. That is not the form in which it was written.

Mr. PARKER. Certainly, it was not, but nevertheless is not that the substance of the contract?

Col. HULL. I doubt it.

Mr. PARKER. It is a matter of doubt?

Col. HULL. I doubt it. I think the company drafted the contract so they would have more rights than that.

Mr. PARKER. Let me ask you another question: If that contract is void and the parties therefore have to stand in statu quo, both being wrongdoers in an illegal contract, all these improvements having been made on the other man's land would be fixtures which would go to the other man. They are fixtures, are they not?

Col. HULL. They are fixtures, but I do not believe your construction is correct, sir.

Mr. PARKER. You do not think the whole contract is void?

Col. HULL. No.

Mr. PARKER. Have you authority for that? I think the cases are very strong, as I look at them, that wherever a material part of the consideration is illegal, the whole contract becomes illegal.

Col. HULL. I think I could find plenty of authorities upon the facts as we have them here.

Mr. PARKER. Now, may I see the other contract with the Air Nitrates Corporation?

Col. HULL. Yes, sir. I might call your attention, on the question of whether this was part and parcel of the consideration, that there was a limit on the compensation which was reached, as I understand it.

Mr. PARKER. Yes; on the compensation, but consideration for putting property on another person's land to which they expected to keep the title and not convey it, and which by being annexed to the land becomes theirs, is another proposition. It was understood that they should not take these improvements without paying the fair value, and that does not seem to me a very unfair contract, but I do not know what the courts would say. Does it seem to you to be doubtful about its being a fair contract?

Col. HULL. We have a number of those, and so far we have not got hurt.

Mr. PARKER. I now pass to the Air Nitrates Corporation contract; did that cover both No. 1 and No. 2, or only No. 2.

Col. HULL. Only No. 2.

Mr. PARKER. In that contract, on the other hand, the improvements and work were upon lands which belonged or were to be acquired by the United States.

Col. HULL. Yes, sir.

Mr. PARKER. It is not in the same position, therefore, as the other contract?

Col. HULL. No, sir.

Mr. PARKER. And the article is not an absolute agreement that the owner of the land shall pay the value of the improvements, but is simply an option, in the nature of an ordinary option, by which they have a right to bid at any sale.

Col. HULL. Yes, sir.

Mr. PARKER. And it is not half as strong an agreement for that reason.

Col. HULL. It is in a different form.

Mr. PARKER. It is just an option, and I think those options are always regarded with some hesitation by the law and are rather strictly considered so as not to prevent fair sales.

Col. HULL. You could strike that out of that contract without mutilating the contract in any way, shape, or form.

Mr. CROWTHER. Colonel, not being a lawyer, I do not intend to interpose any legal questions at this time, but, of course, this will come before the Congress and is before the country absolutely as a fertilizer proposition. That is the propaganda that is being spread all over the Nation, and that is the pressure that will be brought to bear upon Members of Congress.

Now, we have heard with a great deal of interest the discussion regarding the development of hydroelectric power, which, I think, is very pertinent and which is a very important subject, especially to the people in that vicinity and within four or five hundred miles of Muscle Shoals. But I do not find anywhere in this contract that Mr. Ford agrees to produce fertilizer. He agrees to run plant No. 2 at its capacity of 110,000 tons a year of ammonium nitrate which, by the sulphuric process is afterwards changed to ammonium sulphate, which is one of the principal ingredients in fertilizer. But nowhere do I find that he is to make fertilizer. That is one of the very small parts of fertilizer, as it is used now.

Is there any other provision in the contract which provides that he will erect other plants where he will make the base, and, as Mr. Miller suggested, participate in the direct communication to the farmer of the product which has been so much talked about, that is, participate in the distribution? I do not find anything in the contract under which they are going to make it at all.

Col. HULL. Only as set forth in paragraph 14.

Mr. CROWTHER. I read that one, and it provides for the production of nitrogen and other fertilizer compounds.

Col. HULL. Yes, sir.

Mr. CROWTHER. Nitrogen has to be changed into ammonium sulphate. They produce the original ammonium nitrate, with which some of us are more or less familiar, and then it is changed by the sulphuric process to sulphate, and that is what is used principally in the fertilizer compound. But I do not see any provision for the manufacture of fertilizer.

The great general populace all over the country imagine that by some system or other there is to be erected along the shores of this river plants in which they are going to employ a million men, and that they are going to have some

big air tunnels fitted up with some sort of rotary wheels, and they are going to put in the raw materials at one end and shoot it out at the other end as fertilizer. That is the propaganda which is being issued among the farm bureaus and granges, where they meet every week, and that is the proposition we are going to be up against. But I do not think there is any provision in this offer by which he agrees absolutely to make fertilizer.

Do you say that section 14 is the only place where there is any suggestion of that kind?

Col. HULL. Yes, sir.

Mr. CROWTHER. That provides for the production of nitrogen and other fertilizer compounds?

Col. HULL. Yes.

Mr. CROWTHER. Then I think there ought to be something in this contract before you include Mr. Miller's section, something suggested as to this being routed at a reasonable cost to the farmer. We ought to put in something that will provide for the production of it before we provide for its distribution, that the other ingredients shall be furnished to make at this plant a commercial fertilizer that these trade organizations shall have such authority as given here for its distribution, and that there shall be territorial equality as regards the distribution. It is a fertilizer proposition, and as such is before the whole country. People are talking about it all over the country as that sort of a proposition. There are a great many people making fertilizers. The people who make fertilizer buy their nitrates from Chile, or wherever they can buy them in different parts of the country.

Then there are some factories in the South which use crushed cotton seed to make fertilizer. There are many things used as a base. I do not find, as I said before, anything in this contract providing that Henry Ford is to produce fertilizer, but he is simply to produce one of its component parts, known as ammonium nitrate.

Mr. WURZBACH. Colonel, I think you agree with Gen. Beach on the construction of the proposition with reference to the acquisition of land and flowage rights on Dam No. 3, that that means that the Government will acquire that, but that it will be added to the cost of construction of Dam No. 3.

Col. HULL. I think that can be easily arranged next week when we get Mr. Ford's representative here. The question arises now in connection with the exact language in view of the fact that the language was in and was stricken out before the contract was signed, and it raises a question as to just what is the effect of such omission.

Mr. WURZBACH. You do not think it is inconsistent?

Col. HULL. It can be made perfectly clear without the slightest difficulty.

Mr. WURZBACH. Section 19 of Mr. Ford's offer says that "the above proposals are submitted for acceptance as a whole and not in part." Your office assisted in the preparation of this offer. Was that language intended to convey, and does that mean that no modifications or amplifications of this offer will be made by Mr. Ford?

Col. HULL. I would prefer that you ask that question of his representative.

Mr. WURZBACH. The section reads further, "Upon acceptance, the promises, undertakings, and obligations shall be binding upon the United States, and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors and assigns; and all the necessary contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned."

Do you not think that language in its very terms contemplates that this is not the final offer, but that the details of the offer will be worked out during the hearings, or before the end of the hearings, or, if the offer is accepted by the Government, in the preparation of the contracts themselves?

Col. HULL. That depends upon the legislative enactment, if any, and the wording of it. If you were to pass legislation providing for the acceptance of this contract as it is there would be no necessity of further papers between the United States and Mr. Ford in carrying out this contract. We would have certain papers to execute and deliver to carry out the congressional mandate, and his company when organized would have to sign some papers binding the company to carry out these ideas. But this document under certain circumstances, for instance, by acceptance, would stand as a contract between the United States and Henry Ford.

Mr. WURZBACH. For instance, in the matter of security given the Government, a guarantee for the performance of Mr. Ford's obligations as contained in this offer, you anticipate that there will have to be further contracts written in order to secure the Government?

Col. HULL. If you have additional security; yes, sir.

Mr. WURZBACH. What security has the Government under the present offer, if accepted merely by a blank acceptance?

Col. HULL. Mr. Ford obligates his estate, and the company when organized.

Mr. WURZBACH. Do you mean to say his estate would be held liable during the course of 100 years?

Col. HULL. The estate would probably be promptly wound up. You should have some breach of the contract or some fixing of the responsibility of the estate before then. If the breach might occur long afterwards practically the Government would be without protection except the value of the corporation.

Mr. WURZBACH. The estate would probably be divided within 5 or 10 years after Mr. Ford's death.

Col. HULL. Unless the Government intervened.

Mr. WURZBACH. If there had been no breach up to this time of the partition of his estate, under the terms of this contract the Government would not have the right to prevent the distribution of that estate?

Col. HULL. Unless we can show we were liable to be harmed.

Mr. WURZBACH. Assuming everything went along in proper course up to that time, what security would the Government have, under the terms of section 19.

Col. HULL. The company would be held.

Mr. WURZBACH. All of the property that Mr. Ford acquires for the \$5,000,000, except nitrate plant No. 2, which he holds for certain purposes for the benefit of the Government—all of that other property he could dispose of, not only mortgage as was suggested, but he could sell it, or give it away?

Col. HULL. Yes; but, outside of plant No. 2, I think the salvage value of that to-day is not \$5,000,000.

Mr. WURZBACH. It is worth more than that, is it not? The salvage value is over \$8,000,000, and, according to the testimony of Gen. Williams, could be made worth a little over \$16,000,000.

Col. HULL. Does that not include plant No. 2? He can not dispose of plant No. 2, and that is supposed to be worth \$7,000,000 of the \$8,000,000. So the property he can dispose of, which he gets for \$5,000,000, is worth much less than \$8,000,000, about which you have been talking.

Mr. WURZBACH. He could dispose of that, outside of nitrate plant No. 2, could he not?

Col. HULL. He could dispose of that, outside of No. 2; yes.

Mr. WURZBACH. All of the property he acquired except nitrate plant No. 2?

Col. HULL. Yes.

Mr. WURZBACH. What other property would he necessarily have that belonged to him that he could not give as security, or as a guaranty of the performance of this agreement?

Col. HULL. Of course, during his life, everything he owns.

Mr. WURZBACH. I mean what must he place upon this particular property he is offering to lease and purchase?

Col. HULL. Under the terms of this contract?

Mr. WURZBACH. Yes.

Col. HULL. Nothing, specifically under the terms of the contract.

Mr. WURZBACH. Do you not think that by the wording of section 19 it was clearly Mr. Ford's intention to give some other kind of security to the Government to guarantee the performance of his obligation?

Col. HULL. I do not think so.

Mr. WURZBACH. You referred to the laws of Michigan a while ago on this point of security. Do you think the laws of Michigan would control in a question of the measure of damages in a suit the Government might bring against Mr. Ford for breach of his contract?

Col. HULL. It depends on the nature of the breach.

Mr. WURZBACH. For instance, failure to pay the 4 per cent rental; do you think the laws of Michigan would control in that matter?

Col. HULL. They are very important when you come to discuss what you can do against the estate or the administration of Henry Ford's estate. That is the reason I looked up the laws of Michigan.

Mr. WURZBACH. That would only be with reference to his personal estate.

Col. HULL. His personal liability on a contract signed in Michigan.

Mr. FIELDS. Colonel, just what did Mr. Ford say about his obligations, or about binding him up, if he said anything?

Col. HULL. He did not say anything to me.

Mr. FIELDS. He did not make any statement that you know of to any officer to bind him up as tight as they cared to?

Col. HULL. Not that I know of. This was drafted by the office with the idea to bind him as tight as he could be bound, probably.

Mr. FIELDS. He might have said to some other officer, "Bind me as tight as possible," without your knowledge, might he not?

Col. HULL. No. I think the officers would have reported that to me without any delay.

Mr. FIELDS. What additional advantage would the Government have should they require Mr. Ford to give a bond, beyond the conditions in the present proposed contract?

Col. HULL. The bond would probably extend beyond the life of Mr. Ford and should provide for liquidated damages. I want to call your attention to this, that the Government has a very serious burden in a lawsuit to prove that not doing something for the farmer would cause a monetary loss to the Government of the United States.

Mr. FIELDS. If the Government recovered from a bonding company, it would have to establish its claim?

Col. HULL. It would have to be in the nature of liquidated damages.

Mr. FIELDS. It would have to establish its claim?

Col. HULL. If it was drafted in the shape of liquidated damages, only the default need be established.

Mr. FIELDS. During the lifetime of Mr. Ford, or so long as his estate is held intact, any damages that might attach against him would be secured?

Col. HULL. This clause would secure the Government on anything we could establish.

Mr. FIELDS. And any estate that the company might own would after that time secure the Government?

Col. HULL. It would probably be used; yes, sir.

Mr. FIELDS. Even during the lifetime of Mr. Ford, if a thing of that kind should occur.

Col. HULL. Yes.

Mr. FIELDS. In the nature of things Mr. Ford must do one thing right away, or the Government would have cause of action against him. He must invest a great deal of money, or his company must invest it, within the not far distant future, or the Government would have a cause of action against him for his failure to do so; is that not correct?

Col. HULL. Under what part of the contract, Mr. Fields?

Mr. FIELDS. Well, in connection with the production of the nitrate that goes into the composition of the fertilizer.

Col. HULL. I should say that under section 14 it would be incumbent upon him, within a reasonable time, without any undue delay, to start producing at No. 2. There are other clauses of the contract that do not take effect until the Government has completed the construction of dam No. 2 and then other clauses in regard to the completion of dam No. 3. But with the machinery and equipment now there, under clause 14 he is obligated to start, which means within a reasonable time—not to-morrow, or 50 years from now.

Mr. FIELDS. If he failed to do that the Government is protected by his estate?

Col. HULL. We could compel specific performance.

Mr. FIELDS. If he makes the installation necessary to do that he has quite an investment there which would also protect the Government?

Col. HULL. No; he is bound to start under this proposition without any installation.

Mr. FIELDS. He must have, according to the statement of the Secretary of War, at least a million and a half dollars in installation.

Col. HULL. I do not know as to the nature of that.

Mr. FIELDS. The plant as it now stands produces nitrates used in explosives, and it will require an additional installation of a million and half dollars, and from that up to ten million dollars to produce the nitrates for fertilizer.

Col. HULL. It would require, I think, a million and a half dollars to produce ammonium sulphate, but ammonium nitrate can also be used for fertilizer. I understand plant No. 2 is ready to produce nitrate for explosives right now, and has had a trial run of production.

Mr. FIELDS. At any rate, if Mr. Ford goes very far with improvements there he must invest a great deal of money, which will be an additional protection to the Government in the performance of his contract.

Col. HULL. Every dollar he puts in will be that much protection.

Mr. FIELDS. If he fails to make that he then forfeits his contract and his estate is subject to any damage that the Government might sustain by reason of his failure; is that not true?

Col. HULL. In general, yes.

Mr. FIELDS. I would like to know if you can suggest how we can secure the information asked for by Mr. Kearns with regard to the capitalization of the Air Nitrate Corporation and the profits they made from the United States.

Col. HULL. I do not know where that information can be easily and accurately obtained.

Mr. QUIN. Colonel, this mare's nest that Mr. Miller thinks he has discovered here does not exist, does it?

Col. HULL. I will leave that question to the committee.

Mr. QUIN. This section 15 of the contract proposes to create a board of nine members, does it not; that is, nine voting members, which it specifically sets up?

Col. HULL. Yes, sir.

Mr. QUIN. These farm organizations or their successors named here are to nominate seven of the members of the board, and the President is required to send their names to the Senate, and they are to be confirmed by the Senate; is that not true? That is, seven out of the nine are to be farmers?

Col. HULL. Yes, sir.

Mr. QUIN. Only two of the nine are to be named by the President?

Col. HULL. Yes, sir; seven by the President and two by the company.

Mr. QUIN. Now, it is reasonable to conclude from the fact that these farm organizations drafted this themselves, that they knew what they were doing; is that not true?

Col. HULL. They thought they did.

Mr. QUIN. The language is here. These gentlemen here tried to read out of the contract the thing that Mr. Ford has in it. This board of nine members would have seven farmers on it. This board, in the language set out here, is to regulate what? The manufacture and sale of the fertilizer product and the territorial distribution of it. Mr. Crowther made a very extravagant statement about what the farmers of the United States thought was coming to them. The language that Mr. Ford puts into this contract does not bear out the extravagant statement that Mr. Crowther made. Let us read it. Section 14 says: "The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except it be prevented by strikes, accidents, or other causes beyond its control."

What else does it provide? It says:

"To determine by research whether by means of electric-furnace methods and industrial chemistry there may be produced on a commercial scale fertilizer compounds of higher grades and at lower prices than fertilizer-using farmers have been able to obtain, and to determine whether in a broad way the application of electricity and industrial chemistry may accomplish for the agricultural industry of the country what they have economically accomplished for other industries.

"(b) To maintain nitrate plant No. 2 in its present state of readiness, or its equivalent, for immediate operation in the manufacture of materials necessary in time of war for the production of explosives."

Is it not a fact that that means that all the brains and efficiency of the technical minds engaged in that industry will be employed—that is, guaranteed—under Ford's name and estate for that special purpose? That is the language set out in the offer.

Col. HULL. Certainly he does not contemplate that all the men now in his employ shall be turned over to this work.

Mr. QUIN. No; but he does propose to use the best brains for that specific purpose.

Col. HULL. And also it might be well to call attention to the fact that the board provided for here is not the board of directors for the corporation.

Mr. QUIN. I understand that. It is a board formed for the control of the very things Brother Miller was complaining about. It is for the purpose of seeing that the fertilizer and the sale of it is put out at a profit of not over 8 per cent.

Mr. MILLER. If you will show me anything in that contract that provides that the sale shall be limited to the farmers, I would like to hear you read it—that is, the sale of the product of this plant.

Mr. QUIN. It provides for territorial distribution. The language set out here gives certain powers to the board, does it not?

Col. HULL. Yes, sir.

Mr. QUIN. This contract provides for an amount of fertilizer that Gen. Williams stated yesterday, although I think he made a mistake, and that it would be as much as all the farmers in the United States use to-day.

May I ask Maj. Burns a question? How much would this 110,000 tons per annum of nitrate yield in fertilizer? Have you made that calculation?

Maj. BURNS. At the present time there is being used in fertilizer approximately 80,000 of inorganic nitrogen in plant No. 2 and 40,000 tons of inorganic nitrogen are therefore bound to produce about half of the inorganic nitrogen being consumed in fertilizer.

Mr. QUIN. I believe the Secretary of War stated that it would not make over one-thirtieth of the fertilizer that is used in the country. These are the concentrated forms of fertilizer, are they not?

Col. HULL. Yes, sir.

Mr. QUIN. I do not think my friends there who have talked about fertilizer ever farmed any. Do not the farmers take these concentrated forms of fertilizer and mix them and make their own fertilizers?

Col. HULL. I do not know, sir.

Mr. QUIN. Oh, yes; that is the common custom. I did it when I was a boy. We would take acid phosphate and mix it with leaves and other component parts. We had to do that to save freight rates.

The CHAIRMAN. Mr. Quin, Col. Hull is a lawyer; he is not a farmer.

Mr. QUIN. These other two gentlemen are not farmers, and they were trying to tell about the fertilizer. A sack of phosphate weighs 200 pounds, does it not—what we call raw-bone phosphate—and there is only about 12 pounds of nitrogen in that, is there not?

Col. HULL. I never bought a pound of it in my life.

Mr. QUIN. Do you believe that these farm organizations would be crazy enough to want that sand and dirt weighing 188 pounds hauled from Muscle Shoals, Ala., to Oregon or to Mississippi or to Texas, when they could get the same results by paying the freight only on 12 pounds of the concentrated form?

Col. HULL. Hardly.

Mr. QUIN. We know they would not, and the farmers in this thing as directors know what they are doing. They know that they are getting the fertilizer they want, and they know about the territorial distribution and know that no sales agent, as Mr. Miller seemed to be afraid of, would have control of it.

The CHAIRMAN. I would suggest, Mr. Quin, that you kindly ask some questions of Col. Hull.

Mr. QUIN. There was a question raised here about the Alabama Power Co. contract. Mr. Parker suggested the unethical attitude of the United States Government repudiating that contract. I heard you read that contract, and Gen. Williams stated that he thought the Ordnance Department had attorneys who drafted that. Does it not appear from the wording of that contract that the Alabama Power Co. must have had some good lawyers standing close around?

Col. HULL. I should say they had some attorney in connection with the drafting of that contract.

Mr. QUIN. It is patent on its face that the United States was getting the smutty end of the stick, is it not? I believe in carrying out the moral obligations of this Government, but I do not believe in letting anybody put up a job on the Government, and I am not going to permit it with my vote.

Col. HULL. The Judge Advocate General's department assumes no responsibility for the wording of that contract.

Mr. QUIN. When that corporation received \$285,000 in about one year's time, with Uncle Sam putting up all the money as their fee for the construction work they did there, is it not reasonable to presume that they have been well paid, even if the contract they had were not a nullity?

Col. HULL. The question whether the compensation shall be increased is one for Congress to determine.

Mr. QUIN. Of course, I do not presume there is any lawyer who would think that the War Department would have the right to bind this Government on a

contract of this nature, and I know I do not, and I practiced law 18 years before I came here.

Now, take up this contract with this air corporation, as they call it. Is there anybody who pretends that that would be legitimate after they had gotten all that money out of the Government, from a moral or legal standpoint?

Col. HULL. You mean the question as to their having an option?

Mr. QUIN. Yes; as to whether that would act legally to controvert and prevent the acceptance of the Ford proposition.

Col. HULL. I can not add much to what the Secretary said on that.

Mr. FISHER. After a careful consideration of the contracts entered into by the Government with the Air Nitrates Corporation and the Alabama Power Co., and particularly the paragraphs whereby they reserve options, can you now state, as your judgment, that the reservation of options by those corporations is not a legal obstacle to the United States Government accepting the Ford offer?

Col. HULL. That is my opinion, that the obligations there are not enforceable against the United States.

Mr. FISHER. If the Congress of the United States should decide to accept the Ford offer, has the United States the power to condemn property, the title to which is not in the United States, but upon which buildings have been constructed, which are the property of the United States.

Col. HULL. The lower courts have so held. I will call your attention to the case of *U. S. v. Forbes*, 259 Fed. 585, and on page 591 you will find the following language:

"The claim made by the defendant is that the Secretary of War has some agreement with the city of Montgomery to turn this property over to the city upon the happening of some contingency. Answering this claim, it is apparent from what has been said that the Secretary of War had a legal right to condemn the fee in this land because, in his judgment, he had determined that the fee was necessary, and Congress in its wisdom had given him the right and imposed on him the duty of making this final determination, and he has performed such duty. The United States Government when these damages are fixed and paid will own the fee in the land. What final disposition may be made of this land in 1 year, 10 years, or 100 years from now is no more concern to the defendant than any other citizen of the United States."

You might be interested in the following language. I have read it only to-day:

"Moreover, the court takes judicial notice of the laws of the United States and knows that no contract can legally exist. There is no law that confers authority upon the Secretary of War to sell any real estate, and unless such authority is positively conferred by Congress on the Secretary of War he can not carry out the alleged contract with the city of Montgomery. If the Secretary of War has entered into such a contract, it is void, and a void contract can be of no avail to the defendant."

I might say that a similar case arose in the Federal court at Little Rock, involving the question as to whether the United States can condemn with the idea of saving our rights and protecting our property with a view to salvage, and it is the opinion of the office, and also, I understand, it has been so held in the Federal court at Little Rock, that the interest of the United States in the salvaging of property is a sufficient public interest, and that we are not merely taking the land from one man to give it to another, which would not be a public purpose. Of course, the question has not been passed on by the higher courts.

Mr. WRIGHT. Colonel, the fact that the option feature of the contract with the Alabama Power Co. is void would not necessarily render void the other parts of the contract?

Col. HULL. Especially when a great deal of it has been executed.

Mr. WRIGHT. Yes. Do you understand from an analysis of that contract that the option feature is one of the moving considerations?

Col. HULL. It was not so expressed.

Mr. WRIGHT. It is rather an incident of the contract?

Col. HULL. It was so expressed in the drafting of the contract.

Mr. WRIGHT. And is not really a part of the substantial consideration which moved the Alabama Power Co. to execute the contract?

Col. HULL. As between man and man, it would be construed as a consideration, but between an individual and the Government, with the law as it is it would not be so construed.

Mr. WRIGHT. The Alabama Power Co., like every other person and corporation, was charged with knowing what the law was when they executed the contract?

Col. HULL. Certainly.

Mr. WRIGHT. Col. Parker, I believe, asked you about section 14 of the Ford offer, the first part of section 14, whereby the company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen, etc. This particular part is what I desire to call your attention to, "except as it may be prevented by strikes, accidents, fires, or other causes beyond its control." The particular words there, "or other causes beyond its control," certainly could not be construed to mean that they would be relieved if they were not making a profit.

Col. HULL. That is the way I answered Judge Parker.

Mr. WRIGHT. The words, "or, other causes beyond its control" are of the same genus or the same species as the words, "strikes, accidents, fires, etc." Would not that be the proper construction?

Col. HULL. Yes, sir.

Mr. WRIGHT. Some act of God, or some providential happening along the same lines.

Col. HULL. Yes; in the same general class.

Mr. WRIGHT. Do you know what this Air Nitrates Corporation realized out of its contract with the Government?

Col. HULL. No, sir.

Mr. WRIGHT. You have no information on that subject?

Col. HULL. I have no information.

Mr. WRIGHT. Do you know the character of transmission line that was constructed by the Alabama Power Co., whether it consisted of steel towers or poles?

Maj. BURNS. Wooden poles with copper wire.

Mr. WRIGHT. You may not know, but perhaps Col. Burns knows whether this nitrate plant No. 2 was constructed on Government land.

Col. HULL. On Government land.

Mr. WRIGHT. That is where the principal investment was made?

Col. HULL. By the Government; yes. That was with the Air Nitrates Corporation.

Mr. WRIGHT. The Air Nitrates Corporation really constructed this nitrate plant No. 2?

Col. HULL. Yes, sir.

Mr. WRIGHT. Incidentally, I believe, Colonel, that is the construction work down there about which so much criticism was made about the lavish expenditure of money.

Col. HULL. Yes; it has been investigated by Congress, by the Department of Justice, and by the War Department.

Mr. WRIGHT. I understand you did not prepare this section 15, about which Mr. Miller asked you?

Col. HULL. No, sir.

Mr. WRIGHT. And you say that is satisfactory to the agricultural interests?

Col. HULL. So I am informed.

Mr. WRIGHT. Do you think it would be possible under that section for some purchasing company to organize and create a monopoly on this product; buy it all up so as to prevent its proper distribution at reasonable prices? Do you not think the Sherman Antitrust Law would take care of that in the absence of this provision here?

Col. HULL. It might be applicable. They would also have to have the cooperation of the board of directors of the company.

Mr. STOLL. Colonel, I want to have a little legal controversy with you relative to section 19, the guaranty clause of Mr. Ford's offer. Secretary Weeks expressed some doubt, but stated, however, he was not a lawyer, as to the guaranty that Mr. Ford made, and some of my brethren of the bar around the table here also expressed some doubt. I want to call your attention to that section 19. There are two distinct clauses, you might say, in it. The first is: "Upon acceptance, the promises, undertakings, and obligations shall be binding upon the United States and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors and assigns." Now, Mr. Ford promises to organize a company and do certain things, and he makes his promises binding upon him and his assigns. There is a semicolon there, and he goes on further to say: "And all the necessary

contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed and delivered by the respective parties above mentioned? Under that can not the Government force Mr. Ford to enter into such guaranties as would be necessary to carry out the proposal that he made?

Col. HULL. I do not believe so.

Mr. STOLL. What does that mean, then?

Col. HULL. You mean—

Mr. STOLL (interposing). What does that section 19 mean if it does not mean that?

Col. HULL. Suppose the Government would say to Mr. Ford, "Your company ought to have a paid-up capital of \$50,000,000." Could they enforce that under that clause, if the Secretary thought that was a reasonable amount?

Mr. STOLL. No; I do not say that it says what the capital shall be, but I say that it forces him to give a guaranty to carry out what he has obligated himself to do; otherwise that last clause there is absolutely of no value.

Col. HULL. He has already guaranteed it personally.

Mr. STOLL. Agreed personally to form a company, and he backs up that promise to form a company.

Col. HULL. And also to do other things.

Mr. STOLL (continuing). By his own guaranty and by what his property is worth, and then it says, "and all the necessary contracts, leases, deeds, and other instruments necessary" to do what? Or appropriate to do what? To effectuate the purposes of this proposal. Now, what does that mean?

Col. HULL. Under that clause there was somewhat of an argument that Mr. Ford by the time he would organize the company that would bind itself to do all these things would be excused. A careful study of the language convinces me that Mr. Ford is bound, as well as the company, and is not discharged the minute the company is organized and undertakes these matters, but to go one step further and say that the Government under that language could compel him to do this or that or the other thing, except what he has already bound himself to do, I do not believe the Government can do it.

Mr. STOLL. Mr. Ford, for instance, said that he would operate this plant for 100 years for the purpose of manufacturing certain elements used in fertilizers, at 8 per cent profit. Now, when it says here, "necessary contracts to effectuate that," what will you stipulate in the contracts to effectuate that unless you make him put a guaranty in it; in fact, everything that he has promised to do, this says we will make contracts whereby he will effectuate what he has promised to do, and no other construction can be put on it that I can see, except that he would be compelled to enter into a guaranty to do it. That is the only practical, legal construction that could be put on it.

Col. HULL. That provides for the deeds and contracts he has already bound himself to. I do not believe that clause would permit anyone, the court or the Secretary of War, to hold he would have to put any other additional guaranty.

Mr. STOLL. What do you mean, then, Colonel, by the words, "to effectuate the purposes of this proposal"? What does that mean?

Col. HULL. How about the Government turning over the deeds?

Mr. STOLL. That is for the Government to do, but both of them have got—

Col. HULL (interposing). What about the construction contracts for Dams 2 and 3?

Mr. STOLL. Well, what else? To get back to the fertilizer proposition, how under the contracts that the Government must enter into—

Col. HULL (interposing). Those are some of the contracts that would have to be entered into—those construction contracts.

Mr. STOLL. And also the payment of interest, and all that sort of thing. How can the Government form a contract to effectuate the purposes of that promise of Mr. Ford unless they put a guaranty in it? What other means could they adopt unless they put a guaranty in it?

Col. HULL. I am sorry I do not fully follow you.

Mr. STOLL. It is as clear to me as the nose on a man's face. I will state it again, referring to the second clause after the semicolon in paragraph 19; I will use this as a concrete illustration. Mr. Ford agrees to make fertilizer, or the elements of fertilizer. Now, in fixing the contract, you admit that the Government and Mr. Ford have to enter into a contract?

Col. HULL. Not necessarily. This may be the only contract as far as the main purposes are concerned.

Mr. STOLL. You have got to enter into something.

Col. HULL. No contract is necessary to effectuate this feature.

Mr. STOLL. Oh, yes; it is; because the Government has never signed it.

Col. HULL. They may never have to, if Congress accepts the proposal.

Mr. STOLL. Of course, this is all predicated on the idea that this goes through, because if it does not go through we will not need any contracts.

Col. HULL. Suppose Congress passes the resolution and it is approved by the President, stating that we will accept the offer of Mr. Ford. This instrument will not have to be signed by anybody.

Mr. STOLL. I hardly think we will do that. If they pass anything, it will be something authorizing the Secretary of War or some one else to enter into a contract with Mr. Ford, and I do not think Congress would be so foolish as to accept it in that way. Now, when they fix up a contract, as they will have to do, and Mr. Ford has promised heretofore to make this fertilizer, what will you place in the contract that will make him carry out this part to effectuate the purposes of this proposal unless you put a guaranty in it?

Col. HULL. On the contract as it stands to-day, Mr. Stoll, his promise is the only guaranty. What the Secretary suggested was that there should be additional guaranties. Now you are suggesting that the Secretary, under the terms of this contract, could write those additional guaranties in the contracts.

Mr. STOLL. Oh, no, Colonel; this is not the contract. A contract is where two parties agree, and the Government has never agreed to this.

Col. HULL. No.

Mr. STOLL. This is merely an offer by Mr. Ford, so it can not be construed as a contract. He offers to do certain things, and it is up to the Government to accept or reject it.

Col. HULL. In connection with that, Mr. Ford wanted this matter to be virtually a contract, and he uses language which makes a contract in many cases.

Mr. STOLL. You mean the provision about the acceptance in whole?

Col. HULL. (reading). "The undersigned hereby submits to the Secretary of War, and through him for appropriate action by the President and Congress, the following offer, which shall become a binding agreement upon approval of same by Congress."

Mr. STOLL. Binding agreement on whom, on Mr. Ford?

Col. HULL. Yes.

Mr. STOLL. That is his offer, and he follows all that up when the Secretary was dissatisfied with the original offer whereby he guaranteed for himself and his assigns to do a certain thing—and then he goes on to say that all the necessary contracts must be made for the purpose of carrying this out. Now, I ask how will it be fixed in the contract to effectuate the purposes of the proposal unless you put a guaranty in it of some kind. You can not do it otherwise.

Col. HULL. That is what the Secretary was suggesting, that some additional guaranty be put in.

Mr. STOLL. Under this language, does not Mr. Ford agree to do it?

Col. HULL. No.

Mr. STOLL. Then what do you mean by necessary contracts to effectuate it?

Col. HULL. He thinks his word is sufficient to protect the Government. The Secretary does not. There is not a meeting of minds yet.

Mr. STOLL. If he had thought that he would have stopped at the first clause wherein he bound himself to do it, but there is a semicolon there, and he goes on and agrees to enter into contracts and leases to effectuate these very things.

Col. HULL. There has been no meeting of minds between Mr. Ford and the Secretary yet as to that point?

Mr. STOLL. No; because it is an offer, and that is a part of his offer—to enter into a contract to effectuate what he has offered.

Col. HULL. What he may think will effectuate it and what the Secretary and Congress may think will effectuate it—

Mr. STOLL. (Interposing). As a lawyer, you say that is not an offer to guarantee?

Col. HULL. I would have to say no.

Mr. STOLL. I will have to beg to differ from you.

Col. HULL. I may be entirely wrong.

Mr. STOLL. You certainly are. Now, just a few more facts, Colonel, if you please. How many outstanding contracts has the Government now relative to Muscle Shoals?

Col. HULL. I have had three brought to my attention.

Mr. STOLL. What three are those?

contrary to the Alabama Power Co.?

by the principal one.

ment subjects real estate?

carry plant No. 2. Whether there are any

Co. with the Air Reduction Co. whereby

Mea use of their process for separating

C real estate.

ough the Government is on land owned by the

und No. 2 is on our own land.

say plant at Gorgas.

hib plants of the Alabama Power Co.

plant does not own that land.

does not own that land; no, sir.

pl the Government make a contract to sell Mr. Ford

to condemn.

and it take you to condemn usually? What is the

Government undertakes to condemn, do you know?

How much it is litigated. It may take several years

the title.

Alabama Power Co. made any demand for specific per-

with the Government?

ever read the letter which the Secretary submitted the

General, I want to try to make one or two things clear. Gen.

said that the funds used for the construction of the Muscle

appropriated in the fortification bill. You say that the

under the national defense act. Is it not a fact that the

from the national defense act was used for the work in

plant No. 2?

partly. The project was started under the funds of the

act. The funds provided in the national defense act were

all the expenditures that were made in connection with the

project.

That is quite true.

and the result is that a great many of the projects were virtually

out of funds obtained through "armament and fortification."

As I recall, for Dam No. 2 the appropriations amounted in

to a little over \$17,000,000, and the actual money expended was

\$18,000,000, and the total embraced in the national defense act was

\$20,000,000.

CHAIRMAN. So that after you have obligated about \$17,500,000 there is

much left out of that fund for use at Muscle Shoals, is there?

HULL. I think it was all spent and then reccredited back from other

ations. I am not sure as to that.

BURNS. May I help out a little bit in that matter?

HULL. The Ordnance Department can tell about that much better than

BURNS. The No. 2 plant was always very carefully kept separate from

national defense act of 1916, and not one cent of the national defense act

has been spent on the No. 2 plant or any of its subsidiary plants.

CHAIRMAN. As a matter of fact, the No. 2 nitrate plant cost the Govern-

\$67,000,000.

MAJ. BURNS. Yes, sir.

CHAIRMAN. And we never had that much money in the national defense

act and they had to go to other sources.

MAJ. BURNS. The national defense act of 1916 money was used partly for

the No. 1 plant.

CHAIRMAN. Can you tell the committee just exactly how that \$20,000,000

was expended or the basis of expenditure?

Maj. BURNS. The Engineer Corps has had allotted, I should say, \$17,000,000, most of which has been spent on the dam. I think they still have available several hundred thousand dollars which they are holding to maintain the plant until its final disposition is known. The Ordnance Department had a total of, roughly, \$3,000,000.

The CHAIRMAN. Out of the \$20,000,000?

Maj. BURNS. Yes, sir; although part of it was spent for the land at No. 1 and part of it is still available on the books of the Ordnance Department.

The CHAIRMAN. What do you mean by land at No. 1—the nitrate plant or No. 1 dam?

Maj. BURNS. No. 1 nitrate plant; the Ordnance Department still has money under the nitrate supply act on its books, and the fixed nitrogen research laboratory which is operated at the American University is also being financed out of that fund for the accomplishment of the objective of the appropriation, namely, for the investigation of the fixation of nitrogen for use in munitions of war and fertilizers.

The CHAIRMAN. So anything more than this \$20,000,000 comes out of another appropriation?

Maj. BURNS. Yes, sir; it comes out of the appropriation for fortifications almost entirely. There has been a little ordnance service and repairs of arsenals' money spent for maintenance purposes. I would like to emphasize the fact that not one cent of the national defense act money was spent at the Warrior plant. That was all out of the fortifications appropriations.

Mr. GREENE. Colonel, these questions are asked by a layman and may not be framed correctly to meet the legal mind, but, on the other hand, the public interest is largely on the part of laymen, perhaps, and if put into their tongue we may get something in the way of information. If this proposition on the part of Mr. Ford is accepted as it is written in the copy before us, do you understand that thereby the United States Government is freed entirely from any resulting obligations to any corporation or firm or persons incidental to the Muscle Shoals project in any way after Mr. Ford has taken possession under the terms of the accepted proposition?

Col. HULL. So far as I have been advised, that is correct.

Mr. GREENE. We stand clear of any obligations, except such as may be specified in the proposition of Mr. Ford?

Col. HULL. I do not know all the construction contracts that the engineer department may have made in connection with the dam, or any other matters.

Mr. GREENE. Was it the general intent of this contract that when Mr. Ford took possession he took it subject to all the obligations that were then upon the United States Government relating to the proposition?

Col. HULL. You mean in regard to royalties, and things of that kind?

Mr. GREENE. Any kind of obligation now incumbent upon the Government in the ownership or operation or utilization in any way of the Muscle Shoals project, using the general term.

Col. HULL. So far as I know, we have no obligation outstanding in this contract. It is also silent in regard to his taking over and holding the United States harmless.

Mr. GREENE. It is silent on that?

Col. HULL. So far as I can see.

Mr. GREENE. So there is the possibility of the threat of persons assuming or proposing some claims or rights against the Government which did not pass to Mr. Ford to defend?

Col. HULL. Take the Alabama Power Co. rights, for instance. We agree to turn over to Mr. Ford the title to that property, and the Alabama Power Co. claim they had a contract with us that is legal, and if it is legal Mr. Ford does not agree to hold us harmless against the claims of the Alabama Power Co. We did not ask him to.

Mr. GREENE. One of the things which the general public will want to understand is this: If we complete the contract with Mr. Ford we step out and have unloaded apparently what is regarded as a white elephant.

Col. HULL. We have that obligation, irrespective of Mr. Ford, which does not release us from or increase our obligation.

Mr. GREENE. I appreciate that. What I am trying to get at is for general popular information, whether we are free and clear, and that all obligations that were entailed upon us would pass to Mr. Ford as a part of his consideration?

Col. HULL. No, sir; he would take up the burdens at the time he took over the property, and if any obligations are outstanding we are responsible for them.

Mr. GREENE. The property does not pass to him subject to the rights or royalties of other people?

Col. HULL. If he utilizes the patents, of course, he would have to take over the royalties.

Mr. GREENE. We might be running along having unloaded this property, to use that term, upon Mr. Ford and still ourselves be liable and subject to such claims and interests as other persons might propose against the Government irrespective of Mr. Ford's present operation of the plant?

Col. HULL. No; if there are any claims made for use of the royalties they would be against Mr. Ford.

Mr. GREENE. There would be these other things?

Col. HULL. These other things existing to-day would still be a burden on the Government.

Mr. GREENE. We would have to go through another process to get us out of those obligations.

Col. HULL. If we are liable at all we are liable now, and would have to get free any way.

Mr. GREENE. So that to sum up this contract it does not mean that upon its acceptance we stand out from under completely?

Col. HULL. Oh, no.

Mr. GREENE. I notice this much discussed section 15 by which it is provided that there shall be the creation of a board of not more than nine members from various farmers' organizations that are classified. This contract is to run for 100 years, according to its present term. What is there to guarantee to anybody that farmers' organizations such as are represented here are to continue for 100 years, and therefore have representatives on this board? That may seem like an absurd question, but I want to get at the stability of this board. If a board were to be composed out of existing governmental institutions we would assume it would be permanent, but this is an ephemeral citizens' organization which may pass out of existence as easily as it came into existence. They may disband, and what then would constitute the board?

Col. HULL. There would be an agreement between the Government and Mr. Ford, or it would be referred to the courts.

Mr. GREENE. Then on the happening of such an emergency it would necessitate new action,

Col. HULL. Yes, sir.

Mr. GREENE. There is nothing in the contract that would guarantee any reasonable continuance of this board on its presently proposed foundation?

Col. HULL. Not if the organizations were out of existence and had no successor. Upon the happening of that contingency you would have to have an agreement between the Government and Mr. Ford, or it would have to be referred to a court of equity.

Mr. GREENE. If this board should lapse through any failure of the organizations to perpetuate themselves, and failure of the farmers themselves to agree upon any one who should represent them, there must be a new meeting of the minds between the Government and Mr. Ford?

Col. HULL. Yes, sir.

Mr. GREENE. That is not a permanent guarantee that Mr. Ford would be under the surveillance of the farmers?

Col. HULL. No.

Mr. GREENE. That is not a permanent guaranty that Mr. Ford would be No. 2 for the purpose of producing this ingredient necessary for the making of fertilizer at a specified capacity, with this exception, in language set out, "except as it may be prevented by strikes, accidents, fire, or other causes beyond its control." It is reasonable to assume, of course, that notwithstanding Mr. Ford's production of this sulphate of ammonia for fertilizer purposes under this contract, other concerns, chemical laboratories, and similar industries would be at work on all sorts of methods for accomplishing the same thing. That is something which we are always trying to provide for. If in the course of a few years it is demonstrated that this ingredient of fertilizer can be produced through ordinary commercial sources, and if it becomes as common a staple as many other commercial products, it would manifestly not be to the business interest of Mr. Ford to continue the manufacture at his nitrate plant. It be-

comes a market condition which is one of the causes looking toward its control. Would you think he would be justified then in ceasing to manufacture this ingredient?

Col. HULL. No, sir. I do not think the conditions which you outline would be construed by any court as another cause beyond his control as specified by this contract. That is a technical question and that is the reason I give you the answer that that language among lawyers would mean that it would have to be something that is set forth.

Mr. GREENE. I want to get at the facts.

Col. HULL. That is the same question which Judge Parker asked.

Mr. GREENE. Suppose the farming world commonly accepted as an economic necessity, and so far as that is concerned, an economic advantage, an entirely new process in the manufacture of this product. Would Mr. Ford have to readapt this nitrate plant to meet the new process?

Col. HULL. Yes, sir.

Mr. GREENE. He must keep pace with the developments in the outside world for 100 years?

Col. HULL. He is obligated to do that by the contract.

Mr. GREENE. That you think is quite clear?

Col. HULL. Yes, sir.

Mr. GREENE. Whatever may be the change in the manner of the outside world producing this product or its equivalent he must meet it, and we are assuming that the laws of chemistry will not change, and it will be this ammonium sulphate?

Col. HULL. It might be an entirely different compound.

Mr. GREENE. Then he must meet that compound?

Col. HULL. He would have to meet that proposition to produce fertilizer, because that is covered in the very next clause in regard to maintaining a research laboratory and to keep on experimenting to get the products in a cheaper and more feasible way.

Mr. GREENE. He would have to follow the thing all through the transmutations of chemistry?

Col. HULL. He has to produce to the maximum given capacity.

Mr. GREENE. I thought the production was of this specific, particular element.

Col. HULL. It says nitrogen and other fertilizer compounds.

Mr. GREENE. Mr. Stoll was interested in asking you about section 19, as to the probability of that section being interpreted to mean that Mr. Ford by the terms of the contract actually guarantees the fulfillment of this part of the contract in that he obligates himself to pass the necessary papers to do it. What do you lawyers say—is the promise to make the guarantee equivalent to a specific guarantee? I read no promise to make a guarantee. Mr. Stoll does.

I was interested in following that question, from a layman's standpoint. I thought a guarantee of anything was in the shape of a specific proposition in specified terms and words as to the particular thing to be done as a guarantee, and generally accompanied by some proposition of indemnity.

Col. HULL. You and I come nearer to agreeing than you and Mr. Stoll.

Mr. HULL. Colonel, I think we are sometimes liable to lose sight of the fundamental idea of this whole matter, and that is that this is a national defense proposition. We have down there at the present time nitrate plant No. 2, built and in working shape, ready to turn out practically at a moment's notice nitrates for high explosives. Now, by this contract we agree to sell this to Henry Ford. Yet we have a string attached to the sale to the effect that at any time we can take that plant over and operate it for the production of nitrates for the making of high explosives.

The CHAIRMAN. In case of war.

Mr. HULL. Yes. The question has come to my mind—and I think it is of vital importance—is there anything in this contract to assure the Government that this plant will be maintained under all circumstances as a plant for the manufacture of explosives or nitrates for high explosives in case of war? Is that fully protected? In other words, could Henry Ford assign this plant, as Mr. Greene has suggested, to some other method of manufacturing nitrate for fertilizer and change the method? In other words, I mean, we would have a formula for the manufacture of nitrates for high explosives which is another method. Is that fully protected?

Col. HULL. In section 14 you will find this provision: "To maintain nitrate plant No. 2 in its present state of readiness or its equivalent for immediate

operation, in the manufacture of materials necessary in time of war for the production of high explosives." That is his obligation.

Mr. HULL. In other words, although he would own the factory, if we were to find he was destroying that factory as a factory for the manufacture of nitrates for high explosives, we could stop him?

Col. HULL. It would be a breach of contract, and under section 18 we would have the right to go into the district court for the northern district of Alabama and maintain the appropriate action.

Mr. HULL. He could not destroy it in any way without our stopping him; we would have the right to stop him if he tried to assign it to somebody else, or sell it for some other process? We would still have the right to go in?

Col. HULL. I think so, without the shadow of a doubt. We would have the right to have that property protected. If we make a deed for the transfer of nitrate plant No. 2, I see no violation of the contract if that clause was written into the deed we would give to Henry Ford for plant No. 2.

Mr. HULL. There is another question that comes up, and that is the question of the profits on this plant for the manufacture of the components of fertilizer. It is agreed that 8 per cent on the money invested is enough, or on the cost per annum. Supposing that the fertilizer is manufactured down there and at a price which, in the opinion of this board, it could be sold, and they sell it at a higher price, in agreement with that board. What would become of the profits in excess of 8 per cent?

Col. HULL. I do not think the board would have any right to authorize that. They would have to juggle the figures by putting in other items of cost.

Mr. HULL. How would they do that?

Col. HULL. In a manufacturing enterprise where they have various lines of activities, the figures as to what certain articles will cost are determined to a great degree by the items which they put in the overhead.

Mr. HULL. Your contention is that they would have to reduce the price low enough so they were not making but 8 per cent; is that correct?

Col. HULL. That is in the contract.

Mr. HULL. Then how would they allocate that fertilizer? Suppose they could produce it at a price \$20 cheaper than any other fertilizer, there would be certainly a great object to get hold of it. How are you going to fix the allocation of it to the different factories?

Col. HULL. The board has to make the allocation.

Mr. HULL. They would have the right under the contract to allocate it to farmers?

Col. HULL. They could allocate it by State or sections of the country or by counties.

Mr. MILLER. Colonel. I do not care to indulge in any niceties here at all. What we are trying to get at is something practical. Nitrate plant No. 2 is the country's resource, so to speak, in regard to the production of ammonium nitrate. It is of intense interest to the country that nitrate plant No. 2 shall be preserved and be available for the production of that substance. Suppose there should be a fire which should destroy nitrate plant No. 2. Under the clause of that contract Mr. Ford is excused from the operation of this plant. A fire hazard is always present, and accidental destruction is especially always present in dealing with any ingredient of an explosion. What condition would the United States be left in as to the reproduction of nitrate plant No. 2 in the event of fire, or any other fatality?

Col. HULL. He would be excused from producing nitrate as a result of the fire, but under clause B of article 14 he would be obliged to rebuild because he must maintain the plant in its present state of readiness or its equivalent.

Mr. MILLER. This is aside from that question, but I do not suppose the United States would have an insurable interest in that plant.

Col. HULL. The United States does not insure its properties.

Mr. MILLER. It would not have an insurable interest?

Col. HULL. I think Mr. Ford under that clause would in case of fire or accident be liable.

Mr. MILLER. That would be acted upon reasonably soon.

Col. HULL. Yes; within a reasonable time.

Mr. MILLER. In reference to the ultra vires contract with the Alabama Power Co.—

Col. HULL (Interposing). It is comparable to that.

Mr. MILLER. Practically, as a lawyer—and you are a good one—what would be the best method, as well as the quickest, of determining the stability of

their interest there in order to commence action on the construction of the contract.

Col. HULL. I think the first thing the Government ought to do—and I would recommend it to the Secretary of War without any hesitancy if we had an appropriation—would be to proceed to condemn it.

Mr. MILLER. And acquire the fee?

Col. HULL. And acquire the fee.

Mr. MILLER. Then, that would compel the Alabama Power Co. to establish its right, if any, under the contract.

Col. HULL. Yes, sir.

Mr. MILLER. And then the contract would come properly before the court?

Col. HULL. I doubt it; I think we would have the right to condemn on account of the interest we had.

Mr. MILLER. In the condemnation proceedings, it would be in view of the Government acquiring the fee?

Col. HULL. Yes.

Mr. MILLER. If they desired to test their rights under the contract they would have to set them up?

Col. HULL. They might set them up with a view to defeating the condemnation proceedings if they would prefer to do that.

Mr. FIELDS. Colonel, I would like to hear your opinion as to the full powers of this board which is proposed under section 15 of the contract.

Col. HULL. I have given it no special thought. I should say their full powers were simply those recited here, fixing the price and determining what elements are properly elements of cost and what is the proper distribution.

Mr. FIELDS. Those are pretty broad powers which that board has, are they not?

Col. HULL. They are certainly controlling, so far as the profits which this company would make in the manufacture of this article are concerned.

Mr. FIELDS. The profits on this commodity are under the control of this board?

Col. HULL. Yes; as far as the company is concerned; they would have control of the sales.

Mr. WURZBACH. I do not know whether you understood me to say that section 19 contained a guaranty on the part of Mr. Ford. I think you stated you did not think so.

Col. HULL. I thought it did; that it contained his personal guaranty as strong as it could be written.

Mr. WURZBACH. And that was the limit of his guaranty here?

Col. HULL. That was the limit of his guaranty, Mr. Ford and his estate.

Mr. WURZBACH. Do you not think that the wording of section 19 is not inconsistent with Mr. Ford's intention and willingness to give additional security for the faithful performance of his obligation?

Col. HULL. It would not be repugnant; if Mr. Ford wanted to give any additional assurance, he would be at liberty to do so. I insert herewith copy of the proposal of the General Chemical Co., showing Mr. Baker's acceptance thereon.

GENERAL CHEMICAL CO.,
New York, June 5, 1917.

To the PRESIDENT:

The committee on nitrate supply, under section 124 of the "Act for making a further and more effectual provision for national defense, and for other purposes," has requested the General Chemical Co. to state the terms upon which said company would grant to the Government the right to use its processes, which have been exhibited to said committee, in the "production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers."

In compliance with said request the General Chemical Co. begs to submit the following tender:

The General Chemical Co. hereby places at the disposal of the President, for the purposes aforesaid, and grants to the Government of the United States the use of its processes and designs of apparatus for catalytically combining nitrogen and hydrogen to form ammonia, as exemplified in one or more of its United States patents Nos. 1141947 and 1141948, both of June 8, 1915; 1143366, of June 15, 1915; 1151537, of August 24, 1915; and 1150364 and 1150365, both of November 9, 1915; and such other patents as may hereafter be granted; and the recovery of such ammonia as liquified ammonia or as a salt, such as ammonium chloride, sulphate, or nitrate, and further its process of catalytically converting

ammonia and oxygen into nitric acid and of recovering such nitric acid as a strong acid or as nitrate such as ammonium or sodium nitrate and on whose patentable features final action has not yet been taken, in so far only as the Government shall desire to use the same in its own works for the production of the munitions of war and products useful in the manufacture of fertilizers, upon the following terms and conditions:

1. In so far as the Government shall see fit to employ said processes or apparatus or any of them in the manufacture of products to be used exclusively for munitions of war, no compensation by way of royalty or otherwise will be asked or received by the General Chemical Co.

2. In so far as the Government shall see fit to employ the said processes or apparatus or any of them in the manufacture of products to be used for fertilizers, the Government shall pay to the General Chemical Co. a royalty for such use. The royalty so to be paid shall be based upon the nitrogen content of the material produced for fertilizer purposes and shall be at the rate of \$5 for each ton of 2,000 pounds of fixed nitrogen in whatever form combined, and shall be payable quarterly, until the 9th day of November, 1932, and thereafter until the expiration of all patents involving any substantial feature of the process or apparatus.

3. The General Chemical Co. hereby places at the disposal of the President the entire services of those members of its staff under whose immediate supervision its said processes have been brought to the present stage of development, upon the sole condition that the Government shall assume and discharge all obligations which the company is now under with respect to the compensation of said employees, together with the necessary increase of their expense, so long as the Government shall avail itself of their services.

4. If this tender shall be accepted, the General Chemical Co. hereby undertakes forthwith to communicate to the designated experts for the Government all of its knowledge and discoveries pertaining to the said processes and apparatus, whether or not the same shall be the subject of patents, and from time to time thereafter, so long as the Government shall continue the use of said processes, to communicate all further improvements promptly as they shall come to the knowledge of the company and without further charge for the use thereof, within and subject to the limitations before expressed. And, reciprocally, it is understood that all modifications and improvements in the processes or apparatus, which the Government shall discover or employ, shall be at the disposal of the General Chemical Co. and its licensees, if any, for use in its or their own works, and that all such modifications and improvements shall be freely exhibited upon request to the representatives of the General Chemical Co.

5. It is understood that for all purposes of this agreement and generally so far as concerns the use of said processes, or any part thereof, by the Government, its agents or other parties claiming under it, it and they shall at all times acknowledge and recognize the General Chemical Co. as the sole owner of said processes and of the exclusive right to use the same, subject only to the rights granted to the Government pursuant to this tender, and shall, so far as practicable, exclude the public from all works in which said processes shall be employed, and, generally, shall use all reasonable means to preserve said rights unimpaired.

Respectfully submitted by the General Chemical Co.

W. H. NICHOLLS,
Chairman of the Board.
JNO. A. MARTIN, *Secretary.*

Accepted on behalf of the President, June 14, 1917.

NEWTON D. BAKER.

EXTRACTS FROM THE MINUTES OF A REGULAR MEETING OF THE EXECUTIVE COMMITTEE OF THE GENERAL CHEMICAL CO. HELD ON THE 1ST DAY OF JUNE, 1917.

In the matter of the tender to the President of the use of certain processes of the company for the production of munitions of war by the Government free of royalty, and for the manufacture of fertilizers by the Government upon a royalty to be subsequently fixed, approved by the board of directors April 20, 1917, Mr. Steele reported that the nitrate committee of the War Department desires that the royalty to be paid for the use of said processes in the manufacture of fertilizers should be fixed at the present time, whereupon the following resolution was offered:

"Resolved, That the proper officers of the company be and they are hereby authorized to execute and deliver in the name of the company and under the company's seal, a formal tender of the use of our processes or a contract therefor for the purposes and upon the general terms above stated and in such form as shall be approved by the counsel for the War Department and the general counsel of this company.

"Carried."

A true copy.

_____, *Secretary.*

Mr WURZBACH. The terms of it are not inconsistent with his intention to give additional security.

The CHAIRMAN. Maj. Burns, you are connected with the Ordnance Department of the Army?

Maj. BURNS. Yes, sir.

The CHAIRMAN. Do you know the situation with regard to Muscle Shoals pretty thoroughly? You made a study of it?

Maj. BURNS. I made quite a study of it.

The CHAIRMAN. May I ask you to return on Monday morning, because we may want to ask you some questions?

Maj. BURNS. I will be glad to do so.

(Thereupon, at 5 o'clock p. m., the committee adjourned until Monday, February 13, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Monday, February 13, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

STATEMENT OF MAJ. J. H. BURNS, ORDNANCE DEPARTMENT, UNITED STATES ARMY.

The CHAIRMAN. I want to say to the committee that Mr. Mayo, representing Mr. Ford, has arrived in town this morning. He will be able to come up here, and will come here at 2 o'clock for the afternoon session. In the meantime we will have a thorough explanation of the Muscle Shoals district by Maj. Burns.

Major, the map which is before you is supposed to represent that district pretty well. Can you use that in explaining the matters you want to explain?

Maj. BURNS. Yes, sir.

The CHAIRMAN. Will you kindly state for the record your name in full and the position you occupy in the War Department?

Maj. BURNS. My name is J. H. Burns, major of Ordnance. I am now chief of the ammunition division of the Ordnance Department. I have been for two and a half years connected with the nitrate division of the Ordnance Department, which has control of the nitrate activities centered in the Muscle Shoals region.

The CHAIRMAN. Major, as chief of that division, was your presence at Muscle Shoals required quite frequently?

Maj. BURNS. I have been to Muscle Shoals several times. I went into the nitrate division after all of these activities had been started and practically completed, but I have been connected with the curtailing of activities down there and the establishment of the enterprise on a peace time basis.

The CHAIRMAN. I understood you to say that you had been for two and a half years connected with that division.

Maj. BURNS. Yes, sir; but I came into the nitrate division about June 1, 1919, which, of course, was after the bulk of the work had been done.

The CHAIRMAN. So you are pretty familiar with the plant?

Maj. BURNS. I think I am; yes, sir.

The CHAIRMAN. Now, would you kindly, in your own way, state to the committee for the benefit of the committee just what that plant consists of and the condition it is in at the present time?

Maj. BURNS. The Ordnance Department has only to do with the chemical end of the project at Muscle Shoals, and that is subdivided into two main projects, the No. 1 nitrate plant, and the No. 2 nitrate plant. The No. 1 nitrate plant is located near Sheffield, Ala., and the No. 2 nitrate plant is located about 5 miles up the river, very close to Muscle Shoals, on the Tennessee River.

The No. 1 nitrate plant was started in pursuance of the national defense act of June 8, 1916, by which Congress required that investigations, etc., be made to determine the best method of fixing nitrogen and of using such fixed nitrogen for munitions of war and for fertilizers.

In an effort to carry out the will of Congress the War Department organized several committees, one of which went overseas in order to study the best methods, and finally, as a result of recommendations of these various committees, the No. 1 plant was started to use a modification of the so-called Haber process of fixing nitrogen. The plant itself was started in the fall of 1917, and

it was not only to fix nitrogen and form ammonia but also to change the fixed nitrogen or ammonia into nitric acid, and finally to form ammonium nitrate or the explosive. There was also a plant to concentrate the nitric acid. The plant, as far as every process was concerned, except the fixation part, was a success. The fixation process, however, was not a success. They did produce some ammonia, but the plant only ran intermittently, and they had a great deal of difficulty in making it go even from day to day.

Mr. PARKER. Was that the first part of the process, to fix the nitrogen?

Maj. BURNS. Yes, sir; the fixation of the nitrogen.

Mr. PARKER. And that you could not do?

Maj. BURNS. No, sir; that was not a success. I think it should be pointed out to the committee, however, that this was practically the pioneer effort in America for doing this work, and it would be natural to suppose that the first efforts would discover many serious difficulties.

The CHAIRMAN. You say that a committee was appointed to go overseas and study these processes?

Maj. BURNS. Yes, sir.

The CHAIRMAN. The Haber process you are speaking of now is the German process?

Maj. BURNS. Yes, sir.

The CHAIRMAN. It was used extensively during the early part of the war, especially in Sweden and Norway, where they had enormous water power?

Maj. BURNS. No, sir; not the Haber process. The Haber process does not require very much power. The cyanamid process and the arc process are the processes used up in Scandinavia, and they are used up there because they have such very cheap water power, which is necessary for those processes.

The CHAIRMAN. And that is the process used in nitrate plant No. 2?

Maj. BURNS. Yes, sir. The Germans developed the Haber process so they could make nitrogen without the consumption of a great deal of power.

The CHAIRMAN. Was the Haber process the one that was used in which a terrible explosion occurred in Germany soon after the war?

Maj. BURNS. Yes, sir.

The CHAIRMAN. I do not remember now how many thousands of people were killed by that explosion.

Maj. BURNS. It was a very disastrous explosion, but, of course, the explosion was not due to the process. It was due to the fact they were blasting out the product which had been stored in immense magazines where the material had solidified into a solid cake. It was an explosive material, and unfortunately the blasting material which they used to get it out had sufficient power to set the whole thing off.

The CHAIRMAN. You may proceed, Major.

Maj. BURNS. The Ordnance Department has been holding the No. 1 plant for some time in order to find out what the developments in America would be along the Haber process. We have made studies and designs of the plant, so that we could modify it and make it work in case it were necessary; but, fortunately, we do not believe we have to do that now, because the Atmospheric Nitrogen Corporation, which is a subsidiary of the Solvay Process Co., and the General Chemical Co., has developed at Syracuse, N. Y., a plant which can produce fixed nitrogen by this process. We visited it, and it is a very fine plant and is producing ammonia very satisfactorily. The Haber process is now an accomplished fact in America and is on a commercial basis. The Ordnance Department has therefore recommended to the Secretary of War that this No. 1 plant be disposed of.

The No. 2 plant was started as a direct result of very large requirements for explosives during the war. Shortly after we entered the war we found the requirements for explosives so colossal that they could not be met with T. N. T. or the approved explosive. We ascertained from the English how they were solving their explosives problem, and they were doing it by means of amatol, a combination of T. N. T. and ammonium nitrate. We therefore cast about for some scheme of getting large quantities of ammonium nitrate. We encountered two difficulties; one, a shortage of nitrates from Chile, and the other a shortage of ammonia. So the solution accepted was to put up a plant by the cyanamid process, which would not only take care of the shortage of Chilean nitrates, but it would also take care of the shortage of ammonia, as this plant could make both the ammonia and the nitrates from nitrogen which would be obtained from the air. So this No. 2 plant is absolutely a war plant, erected for the purpose of producing explosives.

The only company in America that understood the cyanamid process was the American Cyanamid Co., which has a plant at Niagara Falls, Canada, and therefore that company was called in to erect this plant. They started early in 1918 and had the plant practically ready for operation at the time of the armistice. The plant has been tested by a low capacity run, 20 per cent of its capacity, and the plant has proven very definitely that it can turn out the quality and quantity of the material that was desired.

The CHAIRMAN. Is that plant practically completed?

Maj. BURNS. Yes, sir; the plant is practically completed. It is ready to-day to turn out its full capacity of material.

The CHAIRMAN. If it should turn out fertilizer and it is desired at any time to begin to turn out explosives, what should be done with the plant.

Maj. BURNS. The product of the plant as it is now constructed is ammonium nitrate. That so far has not been accepted as a good fertilizer material. It has all the qualities for feeding plants, but, unfortunately, it absorbs moisture so rapidly when you put it into fertilizer that it makes the fertilizer gummy. So that you have got to produce some other material there, with the present state of knowledge, in order to fit into the fertilizer market.

You can take the fixed nitrogen that is produced there at a midway point and convert it into ammonium sulphate which is a thoroughly established fertilizer material. If you do this, you would have to put in an additional plant. So I think you could produce ammonium sulphate down there without in any way jeopardizing the value of the plant as a munitions plant.

The CHAIRMAN. Do you know how much the expense would be for making that conversion?

Maj. BURNS. For putting in an ammonium sulphate plant equal to the capacity of the No. 2 plant I believe would require a capital expenditure in the neighborhood of \$3,000,000.

The CHAIRMAN. You may proceed, Major.

Maj. BURNS. There are some adjuncts to the No. 2 plant, namely, the Warrior-Gorgas plant, which has been under discussion a great deal, and the Waco quarry. The Waco quarry was constructed solely for the purpose of supplying limestone to the plant, limestone being one of the raw materials.

The Gorgas plant, which is about 90 miles away, and which is not shown on this map, is about 90 miles south of Muscle Shoals, on land owned by the Alabama Power Co.

There is a little history behind that which I think you ought to know. When it was decided to build the No. 2 plant it was found that they could erect the chemical end much quicker than they could the power end, so they endeavored to find how they could get power quickly. The Alabama Power Co. is the largest power producer in that region. At Gorgas, Ala., they already had constructed and in operation a 20,000-kilowatt plant located on the Warrior River. They had foundations laid and plans made for increasing its capacity when conditions warranted it. So the Ordnance Department went to them and asked them to what extent they could help in the furnishing of power. They stated that by increasing their transmission line to Gorgas they could guarantee to the Government almost at once power for construction purposes provided the Government would tie into their line with this 90-mile transmission line. They stated further that if the Government would increase at once the capacity of the plant at Gorgas they could guarantee power to the United States to the extent of the increase, or 30,000 kilowatts.

That agreement was finally entered into as outlined in contract T-69 and this 90-mile transmission line was erected, and this power plant addition was placed at Gorgas.

There has been mention made of condemning the land on which the Government-owned Gorgas plant is located. As a matter of fact, it is a part and parcel of the Alabama Power plant. It is all under the same roof. The boilers are fed by water through the same intakes. The ash-disposal system and the coal-supplying system are all one, so that it would be just like unscrambling an egg to try to separate those two plants. It is almost impossible.

The CHAIRMAN. Was that the purpose?

Maj. BURNS. No, sir; the idea was very clear-cut, in my judgment, in the minds of the contracting parties. The Alabama Power Co. agreed to put up this additional plant at cost plus 6 per cent for the Government and very definitely agreed when they did it that they would buy back from the Government

at a specified time this plant at a fair value, to be determined by a board of arbitrators, one of whom would be the Alabama Power Co.'s representative, one would be the Government's representative, and one would be selected by the two. In other words, by that contract we were able to sell back to the Alabama Power Co. this whole plant at its fair valuation.

The CHAIRMAN. Has any effort been made to sell it back?

Maj. BURNS. No definite offer because of the fact that the time limit imposed by the contract has not yet arrived.

The CHAIRMAN. In case the Government should decide to hold it or acquire it itself, how would those eggs be unscrambled?

Maj. BURNS. According to the contract the Government can not hold it itself.

The CHAIRMAN. It can not?

Maj. BURNS. No, sir; it must sell to the Alabama Power Co., and if the Alabama Power Co. can not purchase, then we have got to remove the plant and leave the land in a satisfactory condition.

The CHAIRMAN. That is one of the conditions of the contract.

Maj. BURNS. Yes, sir. I think the idea is very definitely fixed in the contract that in case the sale is not consummated to the Alabama Power Co. the Government has got to remove the plant.

The CHAIRMAN. So that, after all, it was only a temporary expedient.

Maj. BURNS. It was an expedient to get for the Government quick power in order to produce explosives at this No. 2 plant.

The CHAIRMAN. For war purposes.

Maj. BURNS. Yes, sir; and that seemed to be the very best solution that the Government could make at that time of this problem.

Mr. PARKER. Mr. Chairman, you might ask him if they have enough power without it.

The CHAIRMAN. I understand they are not running the plant at all. It is in a stand-by condition.

Mr. PARKER. And your own power plant is now completed.

Maj. BURNS. As it stands to-day, we could run our No. 2 plant at practically full capacity without this power plant at Gorgas, because in the meantime we have completed a 60,000-kilowatt plant at Muscle Shoals; but this arrangement with the Alabama Power Co. was of great help to the Government in the early days, because they were able to give us power at the No. 2 plant in May, 1918, or a few months after the plant was started, and we were never short of power as a result of that, in spite of the fact that our own steam plant at Muscle Shoals was not finally accepted until quite a long period of time after the armistice.

The CHAIRMAN. Go right ahead with your statement, Major.

Maj. BURNS. Those are the main projects of the Ordnance Department in that region. The rest of it has to do with the hydroelectric development in the Tennessee River, which has been handled by the Corps of Engineers.

The CHAIRMAN. And you have had little to do with that?

Maj. BURNS. I have had nothing directly to do with that, but, of course, I have heard a good deal of evidence submitted in regard to it; that is all.

The CHAIRMAN. Do you know how nearly completed is Dam No. 2?

Maj. BURNS. You appreciate, Mr. Chairman, that this is secondhand information you are getting from me, and the Corps of Engineers would be able to give you first hand information; but as I understand it from the records, all of the auxiliary construction work pertaining to Dam No. 2 has been completed, and approximately 30 per cent of the concrete work that goes in the dam.

Mr. McKENZIE. Major, in connection with the construction of this plant on the land of the Alabama Power Co., you stated that it would give the Government the benefit of power much earlier than they could otherwise have obtained power to operate the nitrate plant; is that true?

Maj. BURNS. Yes, sir.

Mr. McKENZIE. Is it more difficult to construct a steam power plant than it is a nitrate plant or a plant for the manufacture of fixation of nitrates?

Maj. BURNS. It took considerably longer time in our experience at the No. 2 plant to construct the power plant than it did to construct the nitrate plant.

Mr. McKENZIE. That is not the question I asked you. Of course, that might be possible, but is there anything more difficult in the construction of a steam power plant than there is in the construction of a plant for the production or fixation of nitrogen?

Maj. BURNS. I can only answer that by saying that the No. 2 chemical plant or fixation plant was constructed in much less time than the steam plant that goes with it.

Mr. McKENZIE. I understand that, but I am asking you now for your judgment on this proposition. Knowing the plants, having seen them and the construction of them, would you say that it is a more difficult proposition to construct an ordinary steam-power plant than it is to construct a plant for the fixation of nitrates?

Maj. BURNS. In my judgment, as a result of experience with plant No. 2, you can construct a nitrate plant by the cyanamid process quicker than you can construct the steam-power plant that would go with it.

Mr. McKENZIE. At any rate, you had the power plant constructed at Muscle Shoals before you were ready to produce nitrates at the nitrate plant, did you not?

Maj. BURNS. No, sir; we did not have the steam-power plant at the nitrate plant constructed until long after the fixation plant had been constructed.

Mr. McKENZIE. I understand; but when did you have this experimental test?

Maj. BURNS. The plant was producing fixed nitrogen about the time of the armistice, and we ran it through this small test, I think, in January and February, 1919.

Mr. McKENZIE. Did the Government or the Ordnance Department proceed immediately with the construction of the power plant in connection with the construction of the nitrate plant?

Maj. BURNS. Yes, sir.

Mr. McKENZIE. How long after they began that construction did they enter into this contract with the Alabama Power Co. to take power from the company and also to build an addition to their plant?

Maj. BURNS. I think it was all taken care of at practically the same time. You see, the Alabama Power Co. was able to supply us with power much quicker, because this Gorgas effort was only an expansion of the plant which they had there. Furthermore, they had some foundations already constructed for this additional plant, which they had in mind for their own purposes.

Mr. McKENZIE. Of course, as I remember it, it was the understanding, at least of the Members of Congress, and I assume it was also the understanding of the Ordnance Department, that at Muscle Shoals there could be developed sufficient power to take care of this particular proposition. Was not that your understanding?

Maj. BURNS. Of course, you can develop steam power at Muscle Shoals to almost unlimited extent, I imagine.

Mr. McKENZIE. Yes; but notwithstanding that fact, this particular contract was entered into with the Alabama Power Co. to take power from the company, build a transmission line 88 miles long, build an addition to the plant in such a way that, as you have suggested, it is almost impossible to unscramble it, and the only possible chance for the Government to get free from this proposition is to sell it to the Alabama Power Co.

Maj. BURNS. In my judgment it ought to be sold to the Alabama Power Co.; yes, sir.

Mr. McKENZIE. Is it possible to do anything else?

Maj. BURNS. Not in my judgment.

Mr. McKENZIE. Of course, this is all water that has gone over the dam, but it has something to do with this proposed proposition which we are now considering. That being true, and with this contract entered into by the Ordnance Department with the Alabama Power Co. and the building put up in such a way that it is absolutely impossible to separate the Government's interests from those of the Alabama Power Co., we are asked now to consider that as one of the items that enter into the proposal submitted by Mr. Ford; and, according to your testimony, we would be absolutely unable to deliver to him anything of any value unless we bought out the interest of the Alabama Power Co. in this particular plant on the Warrior River; is that true?

Maj. BURNS. That is exactly the way I see it; yes, sir.

Mr. McKENZIE. Of course, I assume—

Maj. BURNS (Interposing). I would like to point out, Mr. McKenzie, that if you tried to buy out the Alabama Power Co. at Gorgas, you would have to spend a great deal of money.

Mr. McKENZIE. I understand that.

Maj. BURNS. And it would, probably, run into the millions.

Mr. McKENZIE. I assume that is true. Then it appears to me that with the inclusion of this particular project in the proposal of Mr. Ford, we are attempt-

ing to do something that is practically impossible for us to do without great loss to the Government, in so far as it relates to this proposal.

Maj. BURNS. In my judgment, that is entirely correct, sir.

Mr. McKENZIE. I assume, and I think it is fair to assume, that the Ordnance Department, when the department entered into this contract, felt they were conserving the interests of this Government.

Maj. BURNS. Yes, sir.

Mr. McKENZIE. Do you remember the name of the officer that had charge of this particular proposition and prepared this contract?

Maj. BURNS. The contract was signed by William Williams, but the real negotiating officer in the case was Col. J. W. Joyes, of the Ordnance Department.

Mr. McKENZIE. This officer, Mr. Williams, as I take it, was an emergency officer commissioned in the Ordnance Department as an attorney.

Maj. BURNS. Yes, sir.

Mr. McKENZIE. Was he a man who had had large experience?

Maj. BURNS. I only know him more or less casually, but I understand he was a very good officer.

Mr. McKENZIE. However, he involved the Government in a contract which provided that the Government should put up all the money and then pay this company a 6 per cent cost plus profit, and permitted them to build an addition onto their plant in such a way that when the Government got through using it there would not be anything left except to give it to the Alabama Power Co. at such price as the Alabama Power Co. might see fit to offer; is not that the situation?

Maj. BURNS. No, sir. The Alabama Power Co. has got to pay a price that will be fixed by a board of arbitrators; and, as I said before, they have representation on the board of arbitrators, the Government has a representative on the board of arbitrators, and the two then select a third; so that the Alabama Power Co., as I understand, has got to pay to the Government the fair value for its investment at Gorgas.

Mr. McKENZIE. That is, the fair salvage value. That is what that means.

Maj. BURNS. No; the understanding is not that they shall pay the scrap value; the understanding is they will pay the fair, going-concern value.

Mr. McKENZIE. If that should happen, in my judgment, it would be the first example of any sale of Government property where any such consideration entered into the transaction.

Maj. BURNS. It is my understanding that that was the idea, and I believe that really you would get a better return from that Gorgas plant than you will from 99 per cent of the Government undertakings that we have had to salvage as a result of the end of the war.

Mr. McKENZIE. Just one other question and then I will conclude. If I understand your testimony correctly, it is your judgment that the inclusion of this particular plant in the so-called Henry Ford proposal makes it an absolutely impracticable proposition for Congress to undertake.

Maj. BURNS. Yes, sir; it does, in my judgment.

Mr. McKENZIE. I might put just one other question to you. Would you consider that a complete barrier to carrying out this proposal?

Maj. BURNS. As an ordnance officer who is affiliated with ordnance contracts and whose duty it is to live up to its contracts, if I had to vote on the Ford offer I would vote against it on that one point.

Mr. McKENZIE. And unless that can be eliminated by further conference between Mr. Ford and the representatives of this Government, you say unhesitatingly we should not consider the proposition.

Maj. BURNS. I do; yes, sir.

Mr. GREENE. I think Mr. McKenzie has brought out pretty much everything I wanted to ask you, Major. It is apparent, I suppose, by the contract with the Alabama Power Co., providing for the additional plant to be so blended with the original plant, that they could not well be unscrambled, as you say, that the Alabama Power Co. then regarded it as a probable addition to its plant after the war emergency was passed.

Maj. BURNS. Yes, sir.

Mr. GREENE. And it was built with that prospective value in mind.

Maj. BURNS. Yes, sir; they have been using it as part of their system since the war and have been paying us a rental for it.

Mr. GREENE. What was the idea, then, in thinking that they would be likely to refuse to take it, and that they should have to be put to the expense of removing it from their land?

Maj. BURNS. I do not think it was ever anticipated they would refuse to take it.

Mr. GREENE. That was only an alternative in the contract?

Maj. BURNS. Yes, sir; that was an alternative in case something happened that would prevent their taking it.

Mr. GREENE. Is there any way to separate the interests of the United States and of the Alabama Power Co. in this plant; that is, its physical structure, if we were to sell our plant to Mr. Ford?

Maj. BURNS. I do not believe so, sir. I have here a picture of the plant which might help to answer that question.

The CHAIRMAN. Maj. Burns, I will ask you to explain this picture so that the members of the committee may understand exactly what the situation is at the plant.

Maj. BURNS (referring to picture). This is a picture of the plant at Gorgas. The part to the right as you look at the picture is the part that was constructed by the Alabama Power Co. and was in operation when we went to Gorgas. The part to the left is the plant that was constructed for the account of the United States. So that you can see that it is just one plant, all under the same roof. Each interest has a boiler plant and a generating plant included here. However, the electricity is all handled over the same switchboard within the plant. We have a substation here owned partly by the Alabama Power Co. and partly by the Government. The water for the feeding of the boilers, to both sets of boilers, all comes through the same intake from the Warrior River. The ash handling equipment is common, the coal feeding equipment is common and upon the hill here we have a village, part of which is Alabama Power Co. property and the other part Government property.

Mr. GREENE. How can the United States deliver title to Mr. Ford to plant No. 2 with the condition as it is down there now?

Maj. BURNS. As I understood the Judge Advocate General's Department it would be necessary to institute condemnation proceedings, and get title, and then turn it over to Mr. Ford, and, of course, those condemnation proceedings would require us to pay to the Alabama Power Co. a fair value for what property we took over from them, and what damage we caused to them. I personally think those damages would be very high.

The CHAIRMAN. Did not the Acting Judge Advocate General take the position that the Alabama Power Co. had no claim whatever down there under the law, and that their contract with the Government is absolutely void?

Maj. BURNS. I do not think he took the attitude that we would not have to pay to the Alabama Power Co. for any property we took from the Alabama Power Co. or for any damage we inflicted on the Alabama Power Co. He claimed that the option to purchase of the Alabama Power Co. was of no value, as I understand it.

There is another point covering the necessity of this Gorgas plant that I would like to point out. We not only needed power for operation purposes at nitrate plant No. 2 when it was completed, but we also needed power to assist in the construction of it, and this contract with the Alabama Power Co. allowed us to get power, as I said before, in May, 1918, or shortly after construction work at Muscle Shoals was undertaken.

Mr. HULL. Major, following the question asked by Mr. Greene, are you not mistaken in saying that we can not get possession of No. 2. The No. 2 plant, as I understand it, has nothing to do with the development at Gorgas.

Maj. BURNS. I did not understand Mr. Greene's question that way. I thought he meant with reference to a clear title to the Gorgas power plant.

Mr. HULL. No; he said the No. 2 plant.

Maj. BURNS. We can give clear title, in my judgment, to the No. 2 plant.

Mr. HULL. That is what I thought.

Maj. BURNS. Yes, sir; we can do that.

Mr. HULL. That is absolutely an entirely different proposition.

Maj. BURNS. That is correct.

Mr. HULL. I just wanted to clear that question up. You were present the other day and heard Col. Hull, the Acting Judge Advocate General, say that we could give possession of the Gorgas plant if we wished to by a certain line of procedure, and that there was nothing in the contract that would prevent it. That was his testimony, was it not?

Maj. BURNS. Yes, sir; that was his testimony.

Mr. HULL. What have you to say to that?

Maj. BURNS. It is all a question of judgment. I do not think it can be done.

Mr. HULL. Are you a lawyer?

Maj. BURNS. No, sir.

Mr. HULL. It is quite evident that the two departments of the Government, the Ordnance Department and the Judge Advocate General's Department, are not unscrambling these eggs very well for the committee.

Maj. BURNS. We are doing the best we can.

Mr. HULL. Right along that same line, now, what is the reason, and there must be a reason, for Mr. Ford asking for this plant at Gorgas? As I understand it, if I understand it properly, you have a complete steam plant at No. 2 in operation to-day; is not that true?

Maj. BURNS. Yes, sir; not in operation, but ready to operate.

Mr. HULL. Are you not selling power from it?

Maj. BURNS. The plant is leased, but the Alabama Power Co. is not operating it to-day, because they do not need to, because of the fact that the water supply down there is sufficient to take care of the demand by means of water-power energy.

Mr. HULL. They are operating, then, your end of the plant at Gorgas?

Maj. BURNS. Yes, sir.

Mr. HULL. They are operating that plant, and you are receiving some revenue from it?

Maj. BURNS. Yes, sir; a large part of the year.

Mr. HULL. Do you know why they want this plant at Gorgas? I want to know the reason.

Maj. BURNS. It is not a vital part of the Ford offer, in any way.

Mr. HULL. It is not.

Maj. BURNS. I can not see how it would affect the Ford offer if it were left out.

Mr. HULL. Then he could carry out the intent of his contract without this?

Maj. BURNS. Yes, sir; in my judgment.

Mr. HULL. As I understand it, if I have this thing visualized correctly, this plant at Gorgas is some 80 or 90 miles away.

Maj. BURNS. That is correct; yes, sir.

Mr. HULL. And it has to do with a steam plant which would naturally supplement the water power, but if I understand it correctly, it is not necessary or vital, as you say, to the Ford proposition, because at the No. 2 plant you have a steam plant that supplements the water power there.

Maj. BURNS. Yes, sir; we have a steam plant at nitrate plant No. 2 of 60,000 kilowatt capacity.

Mr. HULL. Now, getting back to something that you probably know more about than the rest of us, and that is the chemical end of the proposition of Mr. Ford, there are two things you can manufacture at this plant No. 2, ammonia nitrate and ammonia sulphate; is not that true?

Maj. BURNS. The plant is now equipped to produce ammonium nitrate. It is also equipped to produce ammonia, but it is not equipped to convert the ammonia into ammonium sulphate.

Mr. HULL. And ammonium nitrate is the element we have to have for high explosives.

Maj. BURNS. That was one of the high explosives we used in great quantities during the World War.

Mr. HULL. Is that an explosive itself?

Maj. BURNS. Yes, sir.

Mr. HULL. It would explode without being mixed with other elements?

Maj. BURNS. It would, but it is very difficult to explode. It would be classed as an explosive that is very hard to detonate.

Mr. HULL. It would be very hard to detonate?

Maj. BURNS. Yes, sir; you would never put it in a shell by itself.

Mr. HULL. How long would it take if you had this plant running or if Mr. Ford had it running, producing ammonium sulphate, to convert it back to where it is now and produce ammonium nitrate?

Maj. BURNS. That is a question of judgment.

Mr. HULL. Yes; I know that.

Maj. BURNS. I should say it would take a month or two. That would be my estimate.

Mr. HULL. What would be the probable expense?

Maj. BURNS. If he kept the plant in a stand-by condition the expense would be more or less negligible.

Mr. HULL. That is, if he kept it running or in shape to convert.

Maj. BURNS. Yes, sir. I would like to point out, Mr. Hull, that the Ordnance Department is primarily interested in the development of nitrogen fixation. It is not so much worried about changing the fixed nitrogen, once that is an accomplished fact, into the various forms that are necessary for the manufacture of explosives. In other words, if the Ordnance Department were assured that that plant would continue as a fixation plant, I do not think it would worry very much about keeping the nitric-acid plant and the ammonium-nitrate plant going.

Mr. HULL. That is a very good answer, and that is just what I wanted to know. I am more concerned about this whole matter from a national-defense standpoint, and I want to keep something so that we may have an independent source of nitrates. If we accepted the Ford offer, there would be no question but what we would always have there an independent source of nitrogen in this country.

Maj. BURNS. Yes, sir; the Ford offer, as I read it, has two very important advantages from the standpoint of nitrogen preparedness. In the first place, it guarantees to keep that plant or its equivalent in stand-by and ready to produce the quantity that it was designed for for a period of 100 years. That certainly is a big help to the Ordnance Department. Then it agrees to operate the plant to its present approximate capacity. There is a little doubt in my mind as to just what that means. If it means they are going to produce anything except fixed nitrogen, it is practically of no use to the Ordnance Department. In other words, if they are going to produce such a thing as phosphoric acid, that will not help us, but if they are actually going to continue making fixed nitrogen, it would be a very material help to the Ordnance Department and to the Government from the standpoint of nitrogen preparedness.

Mr. HULL. Under the contract, as I understand it, if they in any way converted this plant so that we would not have it available, we would have the right to stop them, is not that true?

Maj. BURNS. He guarantees to maintain this plant or its equivalent in stand-by. That is a very firm guaranty and would assure us always of having that plant ready to operate. Now, over and above that, he may or may not guarantee to run it as a nitrogen fixation plant. I think you can interpret it very readily to the effect that he does agree to run it as a nitrogen fixation plant. If he does, that is a very great additional benefit to the Government from the standpoint of preparedness.

Mr. HULL. You used the word "stand-by"; you mean if he is running it, it would be in stand-by?

Maj. BURNS. No, sir; if he were running it, it would not be, although it would be in the equivalent of stand-by. What I mean by stand-by is that you are maintaining the plant ready for operation but are not operating it.

Mr. HULL. That is what I understand by stand-by, but, unquestionably, he intends to run it; and as I understand it, he would carry out his contract to run it so that you could convert it at any time into an ammonium nitrate plant.

Maj. BURNS. As I understand it, he makes these two stipulations. One is that he will keep that plant or its equivalent for 100 years ready to produce its present rated capacity of explosive, and the other is that he agrees to operate it to its approximate present capacity for the production of fertilizer.

Mr. PARKER. And fertilizers may not mean nitrates?

Maj. BURNS. That is the fear I have.

Mr. PARKER. You think he might operate it for some other sort of fertilizer?

Maj. BURNS. Yes, sir.

Mr. HULL. You have no doubt in your mind but what he can take plant No. 2 at the present time, when equipped to manufacture ammonium nitrate, and convert it into ammonium sulphate, which we ordinarily say is fertilizer, but which is one of the ingredients of fertilizer.

Maj. BURNS. There is no doubt in the world that the plant can be made to produce ammonium sulphate.

Mr. HULL. There is not any doubt about it?

Maj. BURNS. No, sir. There is a doubt as to the cost at which he will be able to produce it.

Mr. HULL. That is a very important question to have answered, because it has been called into question very often as to whether he could manufacture it or not.

Maj. BURNS. Physically it can be done; economically it is doubtful.

Mr. HULL. There is no doubt but what he can do it if he tries to.

Maj. BURNS. There is no doubt in my mind.

Mr. HULL. Now, plant No. 1, which is the Haber process, as I understand it, he takes over also. Could this plant be converted, after being made a success, to manufacture ammonium nitrate into an ammonium sulphate plant?

Maj. BURNS. Yes, sir; that plant can be reconstructed and can be made to produce ammonium sulphate.

Mr. HULL. Major, there has been some question in regard to the cost of this ammonium sulphate manufactured at plant No. 2. As I understand it, and if I am not correct I want you to correct me, ammonium sulphate is selling around \$50 a ton at the present time. Is that true?

Maj. BURNS. That is correct; yes, sir.

Mr. HULL. At times it was sold, after the war, if I remember aright, at \$90.

Maj. BURNS. After the war it got up as high as \$150 a ton.

Mr. HULL. Yes; it went as high as \$150 a ton.

Maj. BURNS. Yes, sir.

Mr. HULL. And the present price is \$50?

Maj. BURNS. Yes, sir.

Mr. HULL. What is your opinion as to Mr. Ford being able to stabilize that price at \$50 a ton or to be able in the future to reduce it. Of course, I understand this is simply asking for your opinion, but you ought to know something about the expense.

Maj. BURNS. In my judgment, in accordance with our estimates, the price at which he can produce ammonium sulphate, exclusive of interest, taxes, insurance, and obsolescence of the plant, would be approximately \$48 per ton to-day. So that when you add the various overhead charges that a business concern would have to add he could hardly produce ammonium sulphate for less than \$60 a ton, and that also is based upon power at three-fourths of a mill per kilowatt hour.

Mr. HULL. Using power at three-quarters of a mill per kilowatt?

Maj. BURNS. Yes; so, I honestly do not believe Mr. Ford, with the present knowledge of the game, would be able to materially reduce the price of fertilizer. I do believe, however, he could prevent these excessive increases in prices that sometimes come about.

Mr. HULL. He could stabilize the price.

Maj. BURNS. Yes, sir; I believe he could stabilize the price of nitrogen compounds.

Mr. HULL. Of course, you know nothing as to his ability to decrease the cost through his ability to increase production, etc. You know nothing about that.

Maj. BURNS. No; but I do believe there is quite a possibility of that. I believe that we will get big benefits as a result of chemical research.

Mr. HULL. Of course, the question of salaries and the question of the water-power rates that he would pay to the water-power company of his would all enter into that question?

Maj. BURNS. Yes, sir. The price of power is a very important matter in the cost of the fertilizer compound that could be produced at Muscle Shoals.

Mr. HULL. And by the discovery of new processes and new inventions, and by increased production, he might be able to decrease the price very materially.

Maj. BURNS. He might be able to decrease the price. I do not know about the "very material" part of it.

Mr. HULL. Of course, that is a matter of opinion.

Maj. BURNS. There are certainly great possibilities that chemical research will be a big aid in the fertilizer business.

Mr. HULL. Of course, that is all up to Mr. Ford and is a matter of opinion, and I simply wanted your ideas in regard to the cost under the present facilities that exist at plant No. 2, and you still insist that he could carry out his contract and do all this work at plant No. 2 and No. 1 without the addition of the Gorgas plant.

Maj. BURNS. Yes, sir.

Mr. HULL. That is all.

Maj. BURNS. I would like to point out also, with reference to the price of ammonium sulphate, while to-day it is selling for \$50, the prewar average over four or five years was \$60 a ton.

Mr. JAMES. The United States furnished all of the money and the Alabama Power Co. did not furnish a cent, but had a 6 per cent cost-plus contract.

Maj. BURNS. That is my understanding; yes, sir.

Mr. JAMES. And yet the contract is so drawn that the United States is tied up in such a way that it could only sell to one concern, and that is the concern that had already made several hundred thousand dollars out of the deal; is that correct?

Maj. BURNS. Not several hundred. They made \$225,000.

Mr. JAMES. But it was so tied up that the only concern that could buy from the United States was the concern that had made \$225,000 without the investment of a dollar.

Maj. BURNS. That is correct; yes, sir.

Mr. JAMES. Is Col. Joyes still in the service?

Maj. BURNS. Yes, sir.

Mr. JAMES. Do you know what Col. Williams is doing at present?

Maj. BURNS. I understand he has just left for a five-months trip to the Orient.

Mr. JAMES. Do you know of any particular concern that he represented before he went into the Army?

Maj. BURNS. No, sir; I do not.

Mr. JAMES. Do you know any particular concern he represents now?

Maj. BURNS. I do not.

Mr. JAMES. You stated that you do not think Mr. Ford can cut the price very materially on fertilizer.

Maj. BURNS. That is correct; yes, sir.

Mr. JAMES. Do not things of that kind depend a great deal upon the man himself?

Maj. BURNS. Somewhat; yes, sir; but, of course, there are always certain quantities of raw materials you have got to put into your finished product. He can not get greater efficiency than the chemical equation demands, so that there is that limitation. A man, of course, can use labor efficiently or inefficiently, and he can likewise use materials efficiently or inefficiently.

Mr. JAMES. A short time ago the Lincoln Motor Co. failed, and Mr. Ford bought it in the other day at \$8,000,000, and I suppose you have seen where he states he is going to cut the price of that automobile \$1,000, have you not?

Maj. BURNS. Yes, sir; but, of course, while I have very little association with an automobile, I understand that the price of the Lincoln car had not been reduced as the price of other cars had been reduced, and that this reduction of \$1,000 really only puts it in line with the reductions that have taken place in the case of the Cadillac, which is a comparable car.

Mr. JAMES. Where is Col. Joyes located at the present time?

Maj. BURNS. At the Munitions Building, in Washington.

Mr. KEARNS. What was the value of the plant of the Alabama Power Co. when the Government built this addition to its plant?

Maj. BURNS. It would be very hard to give that information. Their generating plant amounted, in capacity, to 20,000 kilowatts, and ours had a capacity of 80,000 kilowatts, so that it had two-thirds as much capacity as our own. Our properties down there cost about \$4,000,000—that is, our steam plant—so that on that basis their steam plant alone would be worth two-thirds of \$4,000,000, or approximately \$2,667,000. It probably did not cost that much, but in addition to that they have transmission lines and stations that they erected to tie in with their Gorgas plant.

Mr. KEARNS. That was at the expense of the Alabama Power Co.?

Maj. BURNS. Yes.

Mr. KEARNS. What was the Alabama Power Co. doing at the time the Government entered into the contract with them?

Maj. BURNS. They were manufacturing and selling power to the neighborhood surrounding Birmingham, Ala.

Mr. KEARNS. You think they had an investment of two or three million dollars?

Maj. BURNS. I think they had an investment in excess of \$3,000,000 in connection with their Gorgas plant.

Mr. KEARNS. What did they do to earn this fee of \$285,000?

Maj. BURNS. They built that plant for us.

Mr. KEARNS. What plant?

Maj. BURNS. This Gorgas plant I was speaking about.

Mr. KEARNS. The Government paid for it, did they not?

Maj. BURNS. They built it; we had a contract with them for the building of the plant.

Mr. KEARNS. The Government furnished the money, did they not?

Maj. BURNS. The Government furnished the money, but the power company furnished practically everything else.

Mr. KEARNS. What did they furnish?

Maj. BURNS. They furnished their knowledge. That was the principal thing they furnished, of course.

Mr. KEARNS. The men who did the work were employed by the Government?

Maj. BURNS. They were paid by the Government.

Mr. KEARNS. And the materials were paid for by the Government?

Maj. BURNS. Yes, sir.

Mr. KEARNS. The machinery that went into the manufacture of that product was paid for by the Government?

Maj. BURNS. Yes.

Mr. KEARNS. The Alabama Power Co. paid nothing?

Maj. BURNS. That is correct, from the standpoint of dollars.

Mr. KEARNS. Has the Alabama Power Co. any interest in any of the other projects in and around Muscle Shoals?

Maj. BURNS. I could not tell you that; I do not know.

Mr. MILLER. Major, on this Warrior plant the Government has now spent \$4,979,000 and upward, according to the report of the Secretary of War. You will find that on page 5 of the report of the Secretary of War, near the top of page 5.

Maj. BURNS. Those figures are a little bit high, Mr. Miller.

Mr. MILLER. That is all we have to guide us.

Maj. BURNS. You will find those costs of the projects analyzed on page 24 of the report.

Mr. MILLER. The Secretary of War has reported to us in this language: "The total cost of the plant was \$4,979,782.33." That is the report made to us by the Secretary of War. That is on page 5 of his report. Then on page 24 of his report he analyzes the items that constitute that amount, and informed us that the total is the same sum, \$4,979,782.33.

Maj. BURNS. Of course, the Secretary of War's report tries to generalize the matter. But if you put it this way, that the Government spent \$4,979,782.33 for the purpose of getting power from this Gorgas plant, then you are correct.

Mr. MILLER. Let me call attention to this fact: That these figures, \$4,979,782.33, are the figures of the Ordnance Department. You will see on page 23, at the top of the page, the report of the Ordnance Department to the Secretary of War.

Maj. BURNS. That is correct. The point I want to make is this—that all that money was not spent at Gorgas. It includes the transmission lines and the substations at Muscle Shoals.

Mr. MILLER. The transmission line goes along with the Gorgas plant?

Maj. BURNS. Yes, sir.

Mr. MILLER. We put \$4,979,782.33 into an enterprise and so ingeniously intertwined it with the lines of the Alabama Power Co. that you say it can not be unscrambled?

Maj. BURNS. Yes, sir.

Mr. MILLER. Then we have this situation. The Government put this amount of \$4,979,782.33 into this one plant at Warrior to furnish power to nitrate plant No. 2, built the power plant, the nitrate plant No. 2, and connected it up.

Maj. BURNS. And also to furnish additional power required over and above—

Mr. MILLER (interposing). The capacity of the steam plant at plant No. 2 has double the capacity of the Warrior plant?

Maj. BURNS. That is correct, but the original engineering estimate was that the No. 2 plant would require in the neighborhood of 90,000 kilowatts, and when we add the Warrior plant and the steam plant at No. 2 they will produce 90,000 kilowatts.

Mr. MILLER. According to that the practical operation of plant No. 2 does not produce enough power in its own unit to run it?

Maj. BURNS. Not quite; but the engineer's estimate at the start was that the requirements would be 90,000 kilowatts, and the plant that was constructed was more efficient in the use of power than was planned for, so that the 90,000 kilowatts produced at No. 2 plant will almost completely run the nitrate plant at No. 2.

Mr. MILLER. Then there are three distinct power projects for the operation of this No. 2; first, the Warrior plant constructed at a cost of \$4,979,782.33?

Maj. BURNS. Yes, sir.

Mr. MILLER. Then we built the power plant at No. 2 plant itself?

Maj. BURNS. Yes, sir.

Mr. MILLER. About how much did that cost, approximately?

Maj. BURNS. Approximately \$12,000,000.

Mr. MILLER. That is \$12,000,000 more. Then we have put \$16,000,000 into a dam to furnish a third element for the operation of plant No. 2?

Maj. BURNS. That was not linked in with No. 2.

Mr. MILLER. Then it was found that there was enough power otherwise to drive plant No. 2?

Maj. BURNS. Yes, sir.

Mr. MILLER. Then the \$16,000,000 you put into Dam No. 2 in nowise was necessary to furnish power to operate nitrate plant No. 2?

Maj. BURNS. No, sir; it was not.

Mr. MILLER. Then clearly there must have been some other motive for the construction of that dam if we already had power enough to operate all our units at the Muscle Shoals enterprise generally. There must have been some other pressing reasons that compelled us to start on that dam and put \$16,000,000 into it and require \$25,000,000 more to complete it?

Maj. BURNS. I do not know about that. I do not know what the purpose was with reference to that.

Mr. MILLER. I see your report is to the effect that you can scrap or sell or salvage the Warrior plant at approximately \$3,000,000.

Maj. BURNS. That is our estimate of it.

Mr. MILLER. Then the Warrior plant can be disposed of to-morrow—that is, that single item can be disposed of for three-fifths of what Mr. Ford offers for the whole thing?

Maj. BURNS. In my judgment; yes, sir.

Mr. MILLER. Probably we could get more than \$3,000,000?

Maj. BURNS. In my judgment, \$3,000,000 is about what we would be able to get.

Mr. MILLER. You say you think it will cost a very substantial sum—I infer that from what you say—to acquire the Alabama Power Co.'s rights in the Warrior plant.

Maj. BURNS. Yes, sir; I think so.

Mr. MILLER. And the transmission line of 88 miles extending from that plant to nitrate plant No. 2?

Maj. BURNS. I do not believe it would cost so very much to get the property rights to the transmission line, but I do feel it would cost a great deal to get the property rights to the Gorgas plant.

Mr. MILLER. Did we furnish the wires?

Maj. BURNS. We paid for everything for the transmission line except the land.

Mr. MILLER. Except the right of way and the easements?

Maj. BURNS. Yes, sir.

Mr. MILLER. You say that particular item would not be very expensive?

Maj. BURNS. I do not think so. The condemnation proceedings, I think, would only affect the price of the land. There would be no additional damages, that I can see.

Mr. MILLER. What I am getting at is to see what the Government is getting out of this proposition. We have in the neighborhood of \$89,000,000 invested in that enterprise down there, exclusive of the \$16,000,000 we put into the Wilson Dam.

Maj. BURNS. Yes, sir.

Mr. MILLER. And we are getting \$5,000,000 for that?

Maj. BURNS. Less the money you will have to spend to acquire these rights.

Mr. MILLER. Less the money necessary to acquire the rights of the Warrior plant?

Maj. BURNS. Yes, sir.

Mr. MILLER. And the overflow damages at Dam No. 3?

Maj. BURNS. Of course, that ties in more with the power proposition than with the nitrate proposition.

Mr. MILLER. For which the engineer department estimates the cost to be \$2,000,000?

Maj. BURNS. Yes, sir; according to their report.

Mr. MILLER. Then the \$5,000,000 Mr. Ford is to pay for the plant would be either entirely or in large portion absorbed in paying for the Alabama Power Co.'s rights in the Warrior plant and paying for the overflow damages at Dam No. 3?

Maj. BURNS. My judgment on that is that it would.

Mr. MILLER. So the enterprise on which the Government has put \$89,000,000, in order to comply with the conditions of Mr. Ford's contract, we will get nothing out of, substantially, except the nitrate plant No. 2 in a stand-by condition, as a matter of nitrate preparedness for war.

Maj. BURNS. As I understand it, that is correct; yes, sir.

Mr. MILLER. You have said that the steam plant has a 30,000 kilowatt output?

Maj. BURNS. Yes, sir.

Mr. MILLER. And the steam plant at nitrate plant No. 2 has 60,000 kilowatt output, or double the capacity of the other steam plant?

Maj. BURNS. Yes, sir.

Mr. MILLER. That is 90,000 kilowatts altogether?

Maj. BURNS. Yes, sir.

Mr. MILLER. Have you an estimate of the kilowatt output of Dam No. 2? It is 100,000 horsepower, is it not?

Maj. BURNS. The Chief of Engineers stated it would have a primary capacity of 100,000 horsepower and a secondary capacity to the extent of 440,000 horsepower.

Mr. MILLER. You say it will cost in the neighborhood of \$3,000,000 to convert the ammonium nitrate plant into an ammonium sulphate plant?

Maj. BURNS. To put in the ammonium sulphate plant there, in my judgment, would cost about \$3,000,000.

Mr. MILLER. Would that be in the nature of a new plant or an alteration of an existing plant?

Maj. BURNS. I think it would be substantially a new plant.

Mr. MILLER. Then we would be confronted with this situation, that if Mr. Ford should undertake to alter the process at plant No. 2 to change the production of ammonium nitrate into ammonium sulphate, we would have to transfer that back and rework the plant in case of the necessity for the production of ammonium nitrate?

Maj. BURNS. As I read Mr. Ford's offer, it is contemplated that he would keep the plant in good condition and use it for fertilizer output.

Mr. MILLER. Then you think he is obligated to continue plant No. 2 for the output of ammonium nitrate?

Maj. BURNS. Yes, sir.

Mr. MILLER. He can erect a plant or do anything he wants to for the conversion of the nitrate into sulphate?

Maj. BURNS. That is the way I understand it.

Mr. PARKER. I wish you would tell me briefly what the Haber process is.

Maj. BURNS. It is based upon the welding together of nitrogen gas which you get from the air and hydrogen gas which you get from water. When these gases are well purified and brought together in the presence of a catalyst at a high temperature and pressure they combine and form ammonia.

Mr. PARKER. What materials do you use in that process?

Maj. BURNS. The raw materials are air, water, coke, power, the catalyst, and some chemical purifying agents.

Mr. PARKER. What is your catalyst? Do you use a platinum screen?

Maj. BURNS. No, sir; not for the manufacture of ammonia. It is a secret compound, but its basis is iron.

Mr. PARKER. Is it wasted, so it has to be paid for?

Maj. BURNS. It wastes to some extent. It is very expensive in the first installation, but its consumption, if well treated, is not so very great.

Mr. PARKER. You make use of water, do you not?

Maj. BURNS. We have to get hydrogen from the water.

Mr. PARKER. How do you get that?

Maj. BURNS. By the water-gas method, heating the coke and spraying the water on it, thus separating the water into its gases.

Mr. PARKER. That becomes hydrogen and oxygen?

Maj. BURNS. Yes, sir; hydrogen, oxygen, carbon monoxide, and the rest of them.

Mr. PARKER. How do you get rid of the carbon monoxide?

Maj. BURNS. It is burned into carbon dioxide and then separated from the gases by a purification system. Water and caustic soda are used to absorb the carbon dioxide.

Mr. PARKER. That is another material?

Maj. BURNS. That is one of the chemicals used for purification purposes.

Mr. PARKER. Is there much cost in these materials—the chemical agents and the catalyst?

Maj. BURNS. The costs of your materials in the Haber process are not so very great, but your capitalization cost is quite large and your upkeep charge is high, because the process is a very complicated chemical one.

Mr. PARKER. Is that process being used at Syracuse?

Maj. BURNS. It is; yes, sir.

Mr. PARKER. Then it is not secret anymore? You know what the real process is, since the war ended, do you not?

Maj. BURNS. It is protected by patents, of course, in the name of this company.

Mr. PARKER. Have they the patents?

Maj. BURNS. Yes, sir.

Mr. PARKER. That the Government can not use?

Maj. BURNS. That is correct; except in case of necessity, undoubtedly the Government could use them.

Mr. PARKER. But they have no present right to use them?

Maj. BURNS. No, sir; I do not think they have.

Mr. PARKER. With what commercial success is the Syracuse company making that product?

Maj. BURNS. They are making approximately 10 tons per day of anhydrous ammonia.

Mr. PARKER. Do they make it at commercial prices?

Maj. BURNS. We have never seen their cost sheets, and do not know about that. But they are continuing in the operation of their plant, so they must be making a commercial success of it.

Mr. PARKER. Do they sell it?

Maj. BURNS. Yes, sir; they sell it as anhydrous ammonia.

Mr. PARKER. At what price?

Maj. BURNS. The present price is about 30 cents a pound.

Mr. PARKER. You are not concerned with other matters, if you can get anhydrous ammonia in sufficient quantities?

Maj. BURNS. No, sir; that is the part of the process we are most anxious about, the fixing of the nitrogen.

Mr. PARKER. The 10 tons a day that they produce would be a very small amount of the consumption of ammonia in the United States?

Maj. BURNS. Yes, sir; it is.

Mr. PARKER. What per cent—not 1 per cent, is it?

Maj. BURNS. Putting it on a nitrogen basis, the total consumption of inorganic nitrogen in America is in the neighborhood of 180,000 tons. They would make about 3,600 tons, so it is 2 per cent of the total production of inorganic nitrogen.

Mr. PARKER. That is a very satisfactory result, and something that did not occur until after the war?

Maj. BURNS. That is very satisfactory; yes, sir.

Mr. PARKER. That would make a very large amount of product which is easily converted into sulphate of ammonia or any other material used for fertilizer?

Maj. BURNS. Yes, sir; it is easily converted into ammonium sulphate.

Mr. PARKER. At what price could they make ammonium sulphate?

Maj. BURNS. I said the price of anhydrous ammonia in the market is 30 cents a pound. I do not know what the Atmospheric Nitrogen Corporation is paying as the production cost of ammonia.

Mr. PARKER. Can they properly change that into ammonium sulphate at present prices, or is the ammonium sulphate cheaper?

Maj. BURNS. They could not profitably do it in my judgment because we do not get as much for nitrogen in the form of ammonium sulphate as in the form of anhydrous ammonia.

Mr. PARKER. Do you know wherein plant No. 1 is defective, and what the remedy is for it?

Maj. BURNS. We do; yes, sir.

Mr. PARKER. What is the remedy?

Maj. BURNS. A redesign of part of the plant which has to do with the purification of the gases and of the fixing of the gases to form ammonia.

Mr. PARKER. You know it would work if that were done?

Maj. BURNS. We think it would work; yes, sir.

Mr. PARKER. You would have to get the catalysts, would you not?

Maj. BURNS. Yes, sir.

Mr. PARKER. And buy those at large expense?

Maj. BURNS. That is very much of a secret; that is, the catalyst. We would have to make it ourselves. You appreciate, Mr. Parker, that the Government has had working since the armistice a research laboratory on the problem of fixing nitrogen and converting it into usable forms for munitions and components of fertilizers. They have done a great deal of very important work along those lines, and one of their accomplishments has been the development of a good catalyst.

Mr. PARKER. But you have not tried it on a commercial scale?

Maj. BURNS. No, sir; because we thought the necessity did not call for that, inasmuch as the Atmospheric Nitrogen Corporation had established a plant, for we felt that the objective of the Ordnance Department had been accomplished and that we should not spend any more money.

Mr. PARKER. You think in time of war you would merely assist them rather than use plant No. 1, except in an emergency?

Maj. BURNS. The Chief of Ordnance has recommended that the No. 1 plant be sold.

Mr. PARKER. What would it cost to change it?

Maj. BURNS. To reconstruct the No. 1 plant on a capacity equal to its present rated capacity would cost in the neighborhood of \$4,000,000.

Mr. PARKER. What is its rated capacity; how much a day?

Maj. BURNS. Thirty tons of ammonia per day.

Mr. PARKER. That is three times the capacity of the Syracuse plant?

Maj. BURNS. Yes, sir.

Mr. PARKER. Do you recommend, however, that it be sold?

Maj. BURNS. Yes, sir.

Mr. PARKER. I ask these questions because I think your brief answers explain the matter much quicker than any scientific discussion. What does the other plant do? What is the process used there—that is, plant No. 2?

Maj. BURNS. The first raw materials used are limestone and coke. You burn limestone and form burnt lime, and then these two materials or burnt lime and coke are welded together to form calcium carbide, the material from which we get acetylene gas. The nitrogen is extracted from the air by the liquid-air process and it is combined with the calcium carbide to form the cyanamid or lime nitrogen.

Mr. PARKER. How is that made?

Maj. BURNS. The last welding?

Mr. PARKER. The welding of the nitrogen with the calcium carbide.

Maj. BURNS. That is done in a small oven.

Mr. PARKER. An electric oven?

Maj. BURNS. Heat is the cause of it. If you heat those materials a reaction sets in, and the combination is made.

Mr. PARKER. That makes the cyanamid?

Maj. BURNS. Yes, sir. If you treat the cyanamid with steam you produce ammonia. Then, if you pass ammonia and air through a platinum gauze at a high temperature, and absorb the gases in water, you change the ammonia into nitric acid. Then, if you put ammonia and nitric acid together, you will get ammonium nitrate.

Mr. PARKER. Is that under heat?

Maj. BURNS. One is an acid and the other is an alkali, and they will combine of themselves.

Mr. PARKER. If you want to make sulphate, you take the ammonia and the sulphuric acid and put them together, instead of using the nitric acid?

Maj. BURNS. Yes, sir.

Mr. PARKER. You do not make sulphate out of the nitric acid, but out of ammonia and sulphuric acid?

Maj. BURNS. That is correct; yes, sir.

Mr. PARKER. As the sulphuric acid is much cheaper than nitric acid, you can make the sulphate much cheaper than nitrate, can you not?

Maj. BURNS. Much cheaper; yes, sir. Sulphuric acid has no fertilizer value, however, whereas nitric acid has a great fertilizer value.

Mr. PARKER. The nitric acid is used a great deal?

Maj. BURNS. Yes, sir; that is the basis of the Chilean nitrate.

Mr. PARKER. But the Chilean nitrate is changed into sulphate before it is used in fertilizer?

Maj. BURNS. No, sir; it is used in fertilizer as such.

Mr. PARKER. What is the comparative cost of the nitrate which you get in this factory and the nitrate you get from Chile?

Maj. BURNS. As I stated before, we believe, with power at three-quarters of a mill, we can produce ammonium sulphate at No. 2 plant for approximately \$60 a ton.

Mr. PARKER. I asked about the nitrate.

Maj. BURNS. The nitrate is selling at about \$45 a ton, I believe; that is the Chilean nitrate.

Mr. PARKER. And the nitrate you make would cost you how much?

Maj. BURNS. Ammonium sulphate would cost \$60 per ton.

Mr. PARKER. I am talking about the nitrate; that costs more than \$60 a ton, does it not?

Maj. BURNS. Yes; ammonium nitrate, or the final product of the No. 2 plant, would cost in the neighborhood of \$90 to \$100 a ton, depending on the amount of your overhead.

Mr. PARKER. So, as a peace proposition it is cheaper to buy the nitrate from Chile than it is to make it at the factory?

Maj. BURNS. Not necessarily; because there are varying properties of nitrogen in the compounds of which you speak. The Chilean nitrate has approximately 16 per cent of nitrogen, the ammonium sulphate has approximately 21 per cent of nitrogen, and the ammonium nitrate has approximately 35 per cent of nitrogen. They are all rated in value really upon their nitrogen content.

Mr. PARKER. As a commercial proposition, if you made nitrates there, could you make them at the market price?

Maj. BURNS. You could not make ammonium sulphate to-day in competition with the market price, because I do not believe you could make it for less than \$60 a ton, and the market price at the present time is \$50 a ton.

Mr. PARKER. Can you make the ammonium nitrate at the market price of that product?

Maj. BURNS. Just about; yes, sir.

Mr. PARKER. Are there any processes which, instead of using air and water and limestone, make it out of coke refuse or gas refuse?

Maj. BURNS. One of the by-products thrown off when you make coke out of coal is ammonia, which is thrown out as a gas, and of course that ammonia in fertilizer is just as good as any other ammonia.

Mr. PARKER. That ammonia is being developed more and more from year to year in the by-products ovens?

Maj. BURNS. It is being produced in very large quantities from the by-product coke ovens.

Mr. PARKER. And the by-product coke ovens are making a greater saving every year?

Maj. BURNS. I can only answer that question by saying that the by-product coke-oven industry is expanding.

Mr. PARKER. There are a great many by-products from the by-product coke ovens, are there not?

Maj. BURNS. Yes, sir.

Mr. PARKER. All of which can be sold?

Maj. BURNS. Yes, sir.

Mr. PARKER. So that by-product coke ovens, if they make ammonia in large quantities, will dispose of that for what they can get for it?

Maj. BURNS. They will undoubtedly set the prices for their products so they can get the best combined return.

Mr. PARKER. But no matter what the price of ammonia in the market may be, as charged by the Syracuse company or anybody else, the by-product ovens would be able to lower the price of the ammonia which they are making out of their products?

Maj. BURNS. They would, if they could make their money out of their other products. But sometimes you can not sell coke at the price you would like to.

Mr. PARKER. The by-product coke ovens are making more and more ammonia every year, are they not?

Maj. BURNS. The by-product coke oven business is expanding. On the other hand, there is more or less of a limit as to how greatly it can expand, because their principal product is coke, and unless they can get a ready market for their coke they can not well afford to put in additional by-product ovens.

Mr. PARKER. What proportion of the coke ovens are by-product ovens?

Maj. BURNS. Approximately 55 to 60 per cent of all the ovens are by-product ovens, and the remainder are beehive ovens.

Mr. PARKER. Gas works use coke ovens practically altogether, do they not?

Maj. BURNS. Yes, sir; in the manufacture of coal gas, but not for water gas.

Mr. PARKER. And you have not included those in your estimate of 55 per cent, have you?

Maj. BURNS. No, sir. But they do not have any appreciable effect upon that percentage.

Mr. PARKER. Why not?

Maj. BURNS. That is, as far as the ammonia product is concerned.

Mr. PARKER. Because they do not save it? Is that what you mean?

Maj. BURNS. Their total production of ammonia, even though it were all saved, is not very great as compared with the production in by-product coke ovens.

Mr. PARKER. How much coke is made in coke ovens and how much in gas ovens?

Maj. BURNS. I am informed that gas plants produce about one-tenth as much ammonia as by-product ovens.

Mr. HILL. Major, do you know what Mr. Ford contemplates doing with plant No. 1?

Maj. BURNS. No, sir.

Mr. WURZBACH. Major, in taking issue with Col. Hull on the construction of the contract between the Alabama Power Co. and the Government, did you have in mind the legal obligation or the moral obligation, if any, on the part of the Government?

Maj. BURNS. I do not think I am qualified to argue the legal problems at all.

Mr. WURZBACH. So what you had in mind was a supposed moral obligation?

Maj. BURNS. Principally; yes, sir.

Mr. WURZBACH. Would you not be willing to admit that if the officers of the Government who undertook to make this contract were, in fact, not authorized to make it, but that the power rested with Congress, that you would not infer a moral obligation from an unauthorized act of an agent?

Maj. BURNS. There is another way of attacking the problem. Suppose you assume the contract is illegal, and you start condemnation proceedings to get full title to that land. You have got to pay a great deal of money to establish those rights.

Mr. WURZBACH. Is that what you meant?

Maj. BURNS. Personally, I believe the Alabama Power Co. contract should be lived up to. But in case it is not lived up to, you have that alternative, of beginning condemnation proceedings and paying whatever damages are awarded by the power that controls.

Mr. WURZBACH. That is based on a supposed moral obligation due to the fact that the officers of the Government attempted to make a contract?

Maj. BURNS. No, sir; exclusive of the moral obligation, you would still have these very large damages to pay if you tried to get the property rights which Mr. Ford requires in his agreement.

Mr. WURZBACH. What property is involved in the contract between the Alabama Power Co. and the Government that would have to be passed with a valid title under this contract, according to your construction?

Maj. BURNS. The land on which the Gorgas power plant is located, the land on which the transmission line is located, and the damages to the Gorgas plant that would be caused by our taking that land away from them and giving Mr. Ford a clear title to the plant site.

Mr. WURZBACH. What damages?

Maj. BURNS. As I said, that plant is all under one roof, and it is worked as a combined plant.

Mr. WURZBACH. Part of the property under that roof belonged to the Alabama Power Co. before the contract was made?

Maj. BURNS. Yes, sir; and part of it belongs to the United States.

Mr. WURZBACH. In which item, on page 24 of the Secretary of War's letter, is that particular proposition involved; that is, the Gorgas power plant?

Maj. BURNS. Under the heading "Warrior-Sheffield power station and transmission line." it was included, and comprises the first item under that heading, or the Warrior generating plant, at a cost of \$3,417,702.70; then the Warrior substation, at a cost of \$383,756.35; and also the Drifton Railroad, with a value of \$50,421.94.

Mr. WURZBACH. Which particular part of that photographed property is involved in those items, the Warrior generating plant?

Maj. BURNS. Yes; and the Warrior substation.

Mr. WURZBACH. What was the approximate value of that plant before the Government expended money on it in enlarging it?

Maj. BURNS. I can not tell you that.

Mr. WURZBACH. Was it a substantial, going plant at that time?

Maj. BURNS. Yes, sir; it was a producing plant at that time, and undoubtedly had a value in excess of \$3,000,000.

Mr. WURZBACH. Which other one of these items is the Government's property, so scrambled up with the Alabama Power Co. property that it is difficult to unscramble? I suppose that is the Warrior generating plant proposition?

Maj. BURNS. You include by that question the Warrior generating plant and substation, and the Drifton Railroad, those three? They are all part of the same project.

Mr. WURZBACH. But they are not under that same roof; they could be easily separated, could they not?

Maj. BURNS. The Drifton Railroad is not under the same roof. But the Drifton Railroad does not amount to much, anyway.

Mr. WURZBACH. The value of all that property is given here as \$4,979,782.33.

Maj. BURNS. Yes, sir.

Mr. WURZBACH. Is that the cost to the Government?

Maj. BURNS. Yes, sir.

Mr. WURZBACH. That does not undertake to fix the present value of that property?

Maj. BURNS. No, sir.

Mr. WURZBACH. Is that the cost to the Government based upon a 10 per cent cost-plus basis?

Maj. BURNS. That is the entire cost to the Government, the money expended in the project.

Mr. WURZBACH. You say it is your judgment that this same property could be sold for \$3,000,000, or about 60 per cent of its cost under the 10 per cent cost-plus contract?

Maj. BURNS. Yes, sir.

Mr. WURZBACH. Would that not be a higher value received by the Government than any amount the Government received for any property built during the war under a 10 per cent cost-plus contract?

Maj. BURNS. Not for any property, but it would be more than has been received for a great portion of its property.

Mr. WURZBACH. It generally has received about 10 to 15 per cent of the value?

Maj. BURNS. Approximately that. Of course, those plants had to be sold practically as scrap plants. When we were able to sell a plant as a going concern we got more money for it. I think in some instances where we had by-product coke-oven contracts more or less similar to this power plant contract we got a very substantial proportion of their cost value. I think in some instances it ran as high as 80 per cent.

Mr. WURZBACH. This proposition involved in Mr. Ford's proposal includes an additional expenditure of about \$50,000,000, does it not?

Maj. BURNS. You are referring to the hydroelectric proposition?

Mr. WURZBACH. The whole proposition, the completion of Dam No. 2 and the building of Dam No. 3.

Maj. BURNS. As I understand the report, that is correct.

Mr. WURZBACH. The Government now has invested in and about Muscle Shoals about \$105,000,000?

Maj. BURNS. Yes, sir.

Mr. WURZBACH. That would make a total there of about \$150,000,000 involved in this proposition?

Maj. BURNS. That is correct.

Mr. WURZBACH. If the Government could salvage or receive from the Alabama Power Co. \$3,000,000 for the Warrior generating power station and the transmission line, which is your estimate, then that part of the proposition represents about 2 per cent of the entire proposition in money, does it not?

Maj. BURNS. Yes, sir; that is correct.

Mr. WURZBACH. Would you be willing to turn down a proposition that would otherwise be profitable to the Government on account of the possible loss of \$2,000,000?

Maj. BURNS. Not so much because of the possible loss, but I would turn it down when it causes the Government to break a contract.

Mr. WURZBACH. Coming back to the moral obligation?

Maj. BURNS. Yes, sir.

Mr. WURZBACH. Do you not recognize, Major, that your conclusion would lead you to a violation of every law, every constitutional provision, if you permit an agent to first perform an act which he had no authority to perform and then follow that by saying that because he was the agent of the Government the Government ought to carry out that obligation as a moral duty, and do you not recognize that that would be subversive of all law?

Maj. BURNS. Of course, I think there may be considerable doubt as to whether the officer did really violate the law or exceed his authority?

Mr. WURZBACH. Now you are coming back to the legal obligation.

Maj. BURNS. I am saying there might be a doubt.

Mr. WURZBACH. You are not a lawyer?

Maj. BURNS. No, sir.

Mr. WURZBACH. The law branch of the War Department has held, as was stated before the committee by the Acting Judge Advocate General on Friday last, that the contract is invalid. You heard that statement?

Maj. BURNS. Yes, sir; I heard them say that.

Mr. FIELDS. Major, by whom was plant No. 2 constructed?

Maj. BURNS. The prime contractor was the Air Nitrates Corporation, which is a subsidiary of the American Cyanamid Co.

Mr. FIELDS. What were the terms of the contract under which that plant was constructed—was it a cost-plus contract?

Maj. BURNS. Yes, sir; it was, cost plus a limited fee.

Mr. FIELDS. What was the total cost of the construction of that plant?

Maj. BURNS. In round numbers, \$70,000,000.

Mr. FIELDS. What was the total amount received by this company for the construction of the plant?

Maj. BURNS. This company constructed not only plant No. 2, but also nitrate plants Nos. 3 and 4, which, after the war, were declared surplus. Their total earned fee, as I read the contract, was \$1,500,000. They have received of that amount, approximately, \$1,150,000.

Mr. FIELDS. My question was, What was their total fee for the construction of nitrate plant No. 2?

Maj. BURNS. As I said, as I read the contract they earned a fee of \$1,500,000, but they have only—

Mr. FIELDS (interposing). That is for plant No. 2?

Maj. BURNS. Yes, sir; on plant No. 2. They would have received the maximum fee when the expenditures reached \$60,000,000, and no matter how much work they had to do after that on all three plants, they would have earned no more fee.

Mr. FIELDS. Their total earned fee on this proposition was what?

Maj. BURNS. In my judgment it was \$1,500,000. I wish to point out, however, that they have not been paid all of that fee; they have been paid only \$1,150,000.

Mr. FIELDS. And the Gorgas steam plant and these other matters we have been discussing in connection with the Alabama Power Co. contract were constructed by the Alabama Power Co.?

Maj. BURNS. Yes, sir.

Mr. FIELDS. What was their total fee?

Maj. BURNS. Their total fee was \$225,000.

Mr. FIELDS. That covered all they received?

Maj. BURNS. That covered all of their fee. Then they received \$60,000 for overhead expenses, but that was supposed to be a direct cost, although it was lumped in order to avoid cost accounting.

Mr. FIELDS. Does this contract between the Government and the Alabama Power Co. for the purchase of this property by the Alabama Power Co. at a price to be determined by a board of arbitrators compel the Alabama Power Co. to accept the price fixed by the board?

Maj. BURNS. I think it does. Here is a clause of that sale article, "At any time subsequent to three years after the termination of the war the United States shall have the option to sell to the contractor and the contractor shall, upon the written demand of the United States, buy all its rights, title, and interest in and to the Warrior extension and the Warrior substation, with all rights pertaining thereto, at the value fixed by the board of arbitrators, as hereinafter provided." That would seem to me to definitely require the Alabama Power Co. to purchase provided the Government wishes them to do so.

Mr. FIELDS. It might be a question, it seems to me. Now, as to the value of the property you refer to as a going concern—that is, the Gorgas steam plant—do you regard the estimated salvage value fixed by the Ordnance Department as a fair value for that property as a going concern?

Maj. BURNS. Yes, sir; I do.

Mr. FIELDS. With regard to the production of the fertilizer product contemplated at nitrate plant No. 2, what by-products would be produced along with the production of fertilizer?

Maj. BURNS. None, to my knowledge.

Mr. FIELDS. None at all?

Maj. BURNS. No, sir.

Mr. FIELDS. Referring to your statement with regard to the cost of the production of this product, you recognize the fact, of course, that labor and its efficiency is always a great item in the production of any commodity?

Maj. BURNS. Yes, sir; that is correct.

Mr. FIELDS. Were you basing your figures upon the cost of production by the Government or by private industry when you referred to the cost of it a few moments ago?

Maj. BURNS. I do not know that we differentiated very much in that. We set out against our work what we figured was the proper labor item. We assumed labor would be utilized efficiently. That was the basis of our assumption.

Mr. FIELDS. It seems to me Mr. Ford has always shown great ability to perfect a very thorough labor organization. Do you believe it possible he could perfect an organization there that would produce this product more cheaply than the Government could produce it?

Maj. BURNS. I think, without doubt, Mr. Ford could utilize labor more efficiently than the Government-controlled plant could utilize labor.

Mr. FIELDS. In view of your statement that it would be impossible to unscramble this proposition between the Government and the Alabama Power Co., you think there is only one of two courses open to the Government: The Government must institute condemnation proceedings and take over this property, or sell it to the Alabama Power Co.?

Maj. BURNS. Yes, sir; that is what I think.

Mr. FIELDS. Following a little further what Mr. Wurzbach has said with regard to your contention that the contract should be morally binding, if not legally binding upon the Government, because some agent of the Government happened to enter into it, just how far would a proposition of that kind, if followed to its last analysis, carry us?

Maj. BURNS. I do not think the contract should be lived up to if any talent of any kind could be proved against the parties that entered into the contract.

Mr. FIELDS. Granting that it was legitimate and that the parties who made it on the part of the Government did it with the best intentions, would it not, in the end, bind the executive departments and the Congress as well to a repudiation of the constitutional provisions which place that authority in the Congress?

Maj. BURNS. It seems that it might; yes, sir.

Mr. FIELDS. If the Congress did not maintain the safeguards, as provided in the law and the Constitution, around Government contracts and Government expenditures, there might be no limit to the abuses that would be indulged in by agents of the Government, probably not through ulterior motives but by lack of judgment, by which the Government would be bound if it accepts the contention of the Ordnance Department in this case.

Maj. BURNS. I should say that might be true; yes, sir.

Mr. FIELDS. So the Ordnance Department, in order to protect a contract made by one of its agents, urges the Government to embark upon a rather dangerous policy?

Maj. BURNS. I think, Mr. Fields, we are getting into a complicated legal discussion which I am hardly qualified to indulge in.

Mr. FIELDS. Let us refer to the legal side of it a little further. Whether you have knowledge of the subject or not, is it not fair to assume that the Alabama Power Co., in entering into this contract with the Government, was represented by able counsel?

Maj. BURNS. Yes; I think they were.

Mr. FIELDS. Do you believe that the counsel of the Alabama Power Co. did not know that they were drawing a contract for the agent of the United States Government to sign that was not authorized by law or by the Constitution of the United States?

Maj. BURNS. It is my judgment that they did not draw a contract that they thought was illegal. I do not think that either they or the representatives of the Ordnance Department drew a contract that they thought was illegal.

Mr. FIELDS. Was the gentleman who drew this contract for the War Department a lawyer of noted ability?

Maj. BURNS. I do not know how noted he was, but he was a lawyer.

Mr. FIELDS. Is it fair to assume that great corporations like the Alabama Power Co. would enter into a contract with the Government or anybody else without being represented by able counsel?

Maj. BURNS. I think unquestionably they were represented by able counsel.

Mr. FIELDS. Do you think it is possible that their able counsel did not know that this contract was not authorized by law and by the Constitution; that the power to dispose of property of this character is vested in Congress?

Maj. BURNS. I think it is very probable that they did not know it was against the law. This work was done practically during the fall of 1917 and the spring of 1918, when the war fever was at its height, and when every effort was being made to put the United States in such a condition that it could win the war as quickly as possible, and anybody who hesitated to enter into a contract that would help along that purpose was rated as a slacker.

Mr. FIELDS. I agree with you on that, and am therefore always ready to make reasonable allowance for an agent acting on the part of the Government who might have exceeded his authority. But the object of the attorney for the company entering into this contract was to properly protect his company, and he would evidently look up the law to see if the contract which he was entering into for his company was being drawn in accordance with the law, so it would be a legal contract. He would be a very poor attorney if he did not do that.

Maj. BURNS. That is correct. This matter has been passed upon by the Judge Advocate General's Department. I have every confidence in the world in that department, but I have had enough experience with the law to know that sometimes one judge will say yes to a question and another judge will say no to the same question. So I do not believe it has been proven that this is an illegal contract.

Mr. FIELDS. I notice that the Acting Judge Advocate General read a decision of the Supreme Court of the United States on Friday in support of his opinion in reference to this proposition.

Maj. BURNS. That is correct.

Mr. FIELDS. That is the highest authority in the United States on legal matters.

Mr. QUIN. Major, you are a graduate of West Point?

Maj. BURNS. Yes, sir.

Mr. QUIN. What age are you? I am not asking this in a personal way, but just to get the information in the record.

Maj. BURNS. I am 36.

Mr. QUIN. You are a practitioner of the law, I presume?

Maj. BURNS. No, sir; I am not.

Mr. QUIN. How is it you give such a full opinion on such a very delicate and intricate constitutional legal question?

Maj. BURNS. I do not think I have given any opinion of a legal nature on a legal question. I did not intend to do so.

Mr. QUIN. Did you not say that the United States Government did not have anything but a legal contract with this company, and that the Government could not enter into an agreement with Mr. Ford in connection with this particular property on which the Alabama Power Co. is interested?

Maj. BURNS. I do not know that I answered a question that was framed like that; I did not answer it like that.

Mr. QUIN. Tell us what you did say touching the legality of this contract between the Alabama Power Co. and the United States Government, entered into by a representative of the Ordnance Department?

Maj. BURNS. I did not know that I touched upon the legality of it. I think you have a situation down there that is very complicated and that you should solve it in accordance with the contract that has been drawn up, which requires that the property be sold to the Alabama Power Co. If you do not do that, you will have to condemn the land and pay damages, in accordance with the decision of the judge advocate.

Mr. QUIN. You do not mean to say the Government can not condemn the land and acquire the title?

Maj. BURNS. I do not believe I have said that.

Mr. QUIN. You did not mean in your answer to say that under this alleged contract the Government of the United States could not go ahead and condemn that property?

Maj. BURNS. The judge advocate says it can.

Mr. QUIN. Then there is no legal reason, according to your idea, why the Government can not proceed?

Maj. BURNS. Assuming that it is an illegal contract—I am now getting into the illegality of it again—I believe the United States could condemn.

Mr. QUIN. You did get 'nto it when you answered the question very emphatically, and if you are not for it I want the record to show your exact idea.

Maj. BURNS. I am very glad to give you the facts as I see them.

Mr. QUIN. I want to know just what you meant.

Maj. BURNS. I feel this way about it, that we have a contract with the Alabama Power Co. that I think should be lived up to.

Mr. QUIN. Do you put that opinion upon legal, constitutional grounds?

Maj. BURNS. Principally on the ground that we ought to live up to a contract that was entered into in all good faith by the parties to the contract.

Mr. QUIN. Then if a contract is made that is supposed to be a contract, and made under the circumstances you relate—that is, in violation of the Constitution of the United States, and the party making the contract on the part of the Government did not have any authority under the Constitution, nor through any legislative act of Congress to enter into the contract, and the Alabama Power Co. had people representing them who, constructively at least, knew that to be true, you believe the people of the United States ought to be deprived of this offer on that ground, that we should carry out such an alleged contract as that?

Maj. BURNS. I think the contract ought to be lived up to, even though it forces us to the rejection of the Ford offer.

Mr. QUIN. Then you would be willing to see a contract made by Mr. Williams, who some witness testified was from the National City Bank of New York, the Wall Street banking interests, the Rockefeller, Stillman crowd, at a time when we were conscripting our boys and sending them to die in the trenches—you would be willing to see a contract made with the Alabama Power Co. with nothing but a lot of land and blue-prints for buildings which they were going to construct themselves, and you think this Government under those circumstances should allow these people, after giving them \$285,000 clean profit, without their investing a dollar for construction, investing nothing but their knowledge, to thwart the best interests of the American people by preventing the Government from making a contract with Mr. Ford for the development of this enterprise?

Maj. BURNS. I believe if Mr. Ford is going to insist upon that provision in the contract that the Ford offer ought to be rejected.

Mr. QUIN. In other words, you believe that if an armed hold-up man should force me to sign a check that I ought not to direct the bank not to pay out cash for the check?

Maj. BURNS. You are asking me hypothetical questions. I have tried to make myself plain to the effect that I believe the Government ought to carry out that contract.

Mr. QUIN. On what grounds do you base that opinion?

Maj. BURNS. Because I believe that contract should be lived up to.

Mr. QUIN. Then you do not think that the interests of the American people come ahead of a contract drawn, wherein the party who signed it knew the law and the Constitution of the United States, and must have known that the American people were being deprived of their ultimate rights?

Maj. BURNS. I can see no necessity for the inclusion in the Ford offer of the requirement to give title to the Gorgas plant.

Mr. QUIN. Outside of your viewpoint, Mr. Ford views it otherwise, and he is the man who is putting up the money in this instance. If other people connected with it think it is necessary—I do not know myself, but they seem to think it is necessary—do you not think the Government ought to go ahead?

Maj. BURNS. No, sir; I do not. I think they ought to live up to the Alabama Power Co. contract.

Mr. QUIN. Is that for moral reasons? You do not give any legal reasons for it. You are unaware of any, you say.

Maj. BURNS. I suppose it is a question of judgment, and my conviction is that they should live up to it.

Mr. QUIN. That is your judgment of the question, and not your opinion as a constitutional lawyer. You have not investigated any of the decisions of the Supreme Court of the United States touching this question?

Maj. BURNS. Not in any way, shape, or manner.

Mr. QUIN. When the Acting Judge Advocate General of the War Department says this is an invalid contract, and that the Government, so far as the law is concerned, would have no trouble in proceeding to acquire this property and turn it over to Mr. Ford, you do not dispute that, do you?

Maj. BURNS. I can only repeat my statement, and that is that it is my feeling that the Government should live up to this contract.

Mr. QUIN. What percentage of dirt and sand is there in the Chilean nitrates?

Maj. BURNS. You mean those received in the United States?

Mr. QUIN. Yes; the nitrates we get from Chile.

Maj. BURNS. Those nitrates are practically 95 per cent pure sodium nitrate.

Mr. QUIN. That comes through the chemical work?

Maj. BURNS. No, sir. In the plains of Chile there are deposits of sodium nitrate, but the sodium nitrate is only a part of the soil that is dug up. I think the deposits now are about 20 per cent sodium nitrate. That goes to the refineries and the extraneous matter is removed by chemical processes, and the whole thing is concentrated until it is about 95 per cent pure.

Mr. QUIN. What percentage of nitrogen is in the ordinary commercial fertilizer that is used, and what percentage of ammonia?

Maj. BURNS. There are all kinds of fertilizer materials.

Mr. QUIN. You are acquainted with what they call raw bone phosphate, are you not?

Maj. BURNS. No, sir.

Mr. QUIN. Are you acquainted with the acid phosphates?

Maj. BURNS. Generally.

Mr. QUIN. Take the general average.

Maj. BURNS. Ordinarily, a complete fertilizer material has about 2 or 3 per cent of ammonia, about 8 per cent of phosphoric acid, and 2 or 3 per cent of potash. They have a great many different formulæ.

Mr. QUIN. Do they not have nitrogen in them, too?

Maj. BURNS. That is contained in the ammonia.

Mr. QUIN. I wish you would give us the total percentage, so that the record will show the total percentage of phosphate; that is about 16 per cent, is it not?

Maj. BURNS. It would be somewhere between 13 and 15 per cent.

Mr. QUIN. About 14 per cent, on the average?

Maj. BURNS. That is practically correct.

Mr. QUIN. The rest of it is what?

Maj. BURNS. It is filler of one kind or another.

Mr. QUIN. It is dirt and sand, is it not?

Maj. BURNS. There is some dirt, but most of it is necessary.

Mr. QUIN. Because if you throw down a handful of it and let rain come on it, the chemical part is washed away and the dirt and sand are left there. That is my experience in spreading it over the ground. This plant turning out 110,000 tons of nitrogen a year would make one-half of the total amount of fertilizer consumed in the United States, would it not?

Maj. BURNS. It would make one-half of the inorganic nitrogen content of the fertilizer used in the United States at the present time.

Mr. QUIN. That is what I meant. It would make one-half of the nitrogen content for the maximum consumption of any one year, and that is close to 8,000,000 tons. That is what that plant would turn out, running at a capacity of 110,000 tons a year?

Maj. BURNS. That is substantially correct; yes.

Mr. QUIN. You remember some questions Mr. Miller asked you about this fertilizer business? In the manufacture of fertilizer for the farmers there is about 86 per cent of dirt and sand and about 14 per cent, approximately, of real fertilizer content. Is that not correct?

Maj. BURNS. It is not all dirt. They can not escape putting a certain amount of filler.

Mr. QUIN. I understand that. If it was all nitrogen, you could not afford to buy it.

Maj. BURNS. Take, for instance, the ammonium sulphate. The nitrogen content is only 20 per cent. You can not separate the 20 per cent from the carrier, because you have to have 80 per cent of the carrier to get the ammonium sulphate; you have to have the carrier in acid phosphate and in potash salts, so it would be absolutely impossible to eliminate more than a small part of all the carrier or filler.

Mr. QUIN. What is the carrier composed of?

Maj. BURNS. In the case of ammonium sulphate the big bulk of the carrier is really sulphuric acid, which you have to have to form the ammonium sulphate.

Mr. QUIN. Is not the fertilizer compound made into this concentrated form?

Maj. BURNS. It is, but in ammonium sulphate you can not concentrate the nitrogen any more, because the chemical equation will not allow you to do so. Whenever you furnish ammonium sulphate it is 20 per cent nitrogen and 80 per cent filler or carrier.

Mr. QUIN. Why can not the farmer dig up the dirt and sand and mix them with 1 per cent fertilizer and 4 per cent dirt?

Maj. BURNS. It can not be done because, as I am telling you, in the chemical equation you have to have a lot of this carrier to hold this nitrogen which is used in the fertilizer.

Mr. QUIN. You mean you could not get it there without having all of that?

Maj. BURNS. You could not eliminate more than a small part of it.

Mr. QUIN. What is the distance from plant No. 2, where the power plant, or this water power is going to be, from the Gorgas plant?

Maj. BURNS. The No. 2 plant is about 2 miles from the big hydroelectric dam, and they are both approximately 90 miles from Gorgas.

Mr. QUIN. And this territory over which the transmission line runs to supply the extra power which you state was contemplated there is land that belongs to the Alabama Power Co.?

Maj. BURNS. Yes, sir.

Mr. QUIN. And the Gorgas plant itself is on land that belongs to the Alabama Power Co.?

Maj. BURNS. That is on land that belongs to the Alabama Power Co.

Mr. QUIN. How many acres of land is there?

Maj. BURNS. I think it amounts to about 15 or 20 acres at the Gorgas power-plant site.

Mr. QUIN. What have they at that site?

Maj. BURNS. They have a power plant capable of producing about 20,000 kilowatts by the steam process, and they have a substation for turning that power into their line, and they have a connecting line which ties the substation into their main distribution system.

Mr. QUIN. And that was tied into this alleged contract with the Government?

Maj. BURNS. Yes, sir.

Mr. QUIN. How far is Dam No. 3 above this?

Maj. BURNS. As I heard the testimony, it is the neighborhood of 16 or 17 miles above No. 2 Dam.

Mr. QUIN. In what direction does that stream flow?

Maj. BURNS. In that region it flows a little south of west.

Mr. QUIN. Into what does it empty?

Maj. BURNS. It empties into the Ohio River, as I understand it.

Mr. QUIN. It has its source in the Carolinas or in West Virginia, does it not?

Maj. BURNS. Gen. Beach stated that it has its source in Virginia.

Mr. QUIN. At what point does it enter into the Ohio River?

Maj. BURNS. I do not remember that.

Mr. QUIN. It enters the Ohio River near Paducah, Ky., I think.

Mr. WRIGHT. What business is the American Cyanamid Co. engaged in?

Maj. BURNS. It is engaged in manufacturing materials for the fertilizer trade, principally the nitrogen and phosphoric-acid compounds.

Mr. WRIGHT. Where is its plant located?

Maj. BURNS. It has a plant near Niagara Falls in Canada, at which it makes cyanamid by the same process we use at the No. 2 plant.

Mr. WRIGHT. It makes the same product?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. Has that company any other plant?

Maj. BURNS. Yes, it has a plant at Warner, N. J., where it makes a material called amophos, a combination of phosphoric acid and ammonia.

Mr. WRIGHT. Do you know what the capacity of this Canadian plant of the American Cyanamid Co. is?

Maj. BURNS. It is about one-fourth the capacity of the plant at Muscle Shoals.

Mr. WRIGHT. Do you know where it finds a market for that product?

Maj. BURNS. Generally, I understand, they sell their cyanamid or their amophos to the fertilizer trade as one of the ingredients of a complete fertilizer.

Mr. WRIGHT. Where is the Air Nitrates Corporation located?

Maj. BURNS. It had an office at 511 Fifth Avenue, New York.

Mr. WRIGHT. Is it still in existence?

Maj. BURNS. Yes, I think it is.

Mr. WRIGHT. What business does it do?

Maj. BURNS. It was formed solely for the purpose of executing this contract with the Government for the construction and operation of United States Nitrate Plants Nos. 2, 3, and 4.

Mr. WRIGHT. Do you know what the capital of that corporation is?

Maj. BURNS. I understand the capitalization was \$1,000.

Mr. WRIGHT. How much has it already received from the Government for constructing these plants at Muscle Shoals?

Maj. BURNS. It received a cost-plus fee, and a fee has been paid to the amount or \$1,150,000.

Mr. WRIGHT. They are claiming considerably more?

Maj. BURNS. They are claiming \$1,500,000.

Mr. WRIGHT. The Air Nitrates Corporation is subsidiary of the American Cyanamid Co.; is it not?

Maj. BURNS. That is correct; yes, sir. It was formed, as I understand it, for the purpose of protecting the company from possible difficulties that might ensue as a result of the Government contract.

Mr. WRIGHT. It was really the American Cyanamid Co. which was acting, except that it would be relieved of legal liability.

Maj. BURNS. That is my understanding.

Mr. WRIGHT. The American Cyanamid Co. would undoubtedly receive the profits?

Maj. BURNS. Yes; without doubt. Of course, the American Cyanamid Co. turned over for the construction and operation of this plant all of their talent.

Mr. WRIGHT. The principal consideration there was to secure the services of somebody who knew how?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. Where is the Alabama Power Co. located?

Maj. BURNS. I understand their headquarters are at Birmingham, Ala.

Mr. WRIGHT. Do you know where they were chartered?

Maj. BURNS. No, sir; I do not know that.

Mr. WRIGHT. Is it not a Canadian company, so far as its capitalization is concerned, and was it not chartered in Canada?

Maj. BURNS. I believe it was, but I am not qualified to answer that.

Mr. WRIGHT. Your opinion is that it was chartered in Canada?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. And Canadian or English capital was furnished?

Maj. BURNS. That is my general information.

Mr. WRIGHT. Is it not true, Major, that the Alabama Power Co. is but a branch of the American Cyanamid Co.?

Maj. BURNS. I have never heard any intimation to that effect before this time.

Mr. WRIGHT. Either that, or that the American Cyanamid Co. is an ally of the Alabama Power Co.?

Maj. BURNS. I have never heard any intimation of that before.

Mr. WRIGHT. Do you not understand that these three companies are all of the same origin and are intertwined?

Maj. BURNS. No, sir; I do not.

Mr. WRIGHT. In what business is the Alabama Power Co. engaged?

Maj. BURNS. In the manufacture and sale of power in the general region surrounding Birmingham, Ala.

Mr. WRIGHT. Incidentally, these contracts, or the one entered into by the Alabama Power Co., had a clause which gave it an option to buy the Warrior Steam Plant?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. That was a part and parcel of the construction contract?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. That company received from \$225,000 to \$285,000 for its services?

Mr. BURNS. It received a fee of \$225,000 on that contract.

Mr. WRIGHT. They executed the construction of this steam power plant at Gorgas?

Maj. BURNS. Yes, sir; that is correct.

Mr. WRIGHT. That was an emergency, so far as the Government was concerned, and was so considered?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. The prime object was to produce nitrates in Alabama for the War Department?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. And it was contemplated that the power from Dam No. 2 would be sufficient to run that nitrate plant No. 2, when developed, or to operate nitrate plant No. 2?

Maj. BURNS. I can not describe or explain what was in the back of the minds of the people who started the Wilson Dam.

Mr. WRIGHT. Is it not true that the nitrate project was started by the Government principally because they thought they could get cheap water power there?

Maj. BURNS. My understanding is that the No. 2 plant was started there, because Muscle Shoals was the best-known site, and the raw materials were available.

Mr. WRIGHT. And the element of power was one of the material things?

Maj. BURNS. Hydroelectric power could not have been considered very seriously, because they must have known it would have taken much longer to produce power from a dam in the river than to produce power from a steam plant.

Mr. WRIGHT. Can you tell us why they started Dam No. 2 if it was not intended to use it in that way? It was the only activity the Government had down there.

Maj. BURNS. I can not explain that.

Mr. WRIGHT. That was the prime object, was it not?

Maj. BURNS. If you want to know the way I look at it now, it seems to me it was started to fit in with the No. 2 nitrate plant, but I do not know the intention of the people who started the project.

Mr. WRIGHT. This contract for the Warrior plant was entered into to get power quickly for nitrate plant No. 2, was it not?

Maj. BURNS. That is correct.

Mr. WRIGHT. It was contemplated that when that steam plant near the nitrate plant was completed the Government would have no further use for the Warrior plant, was it not? In other words, the steam plant near nitrate plant No. 2 was adequate to furnish power?

Maj. BURNS. No, sir; not quite. When that plant was originally designed it was expected that 90,000 kilowatts would be required to run it, and they got that by getting 30,000 from the Alabama Power Co. and 60,000 from the Government's steam plant at Muscle Shoals. In that contract the Alabama Power Co. had to furnish power during the war; they could not buy back that plant during the war.

Mr. WRIGHT. It was contemplated that the steam plant near nitrate plant No. 2 would supplant the power plant at Warrior, was it not?

Maj. BURNS. No, sir. When the project was designed it was thought that 90,000 kilowatts would be necessary, and therefore we had to make a contract for the 30,000 kilowatts from the Alabama Power Co., as well as to use the capacity of the steam plant at No. 2. The operation of the plant leads us to believe that the No. 2 plant can be operated nearly to its complete capacity with only the steam plant at Muscle Shoals.

Mr. WRIGHT. Near nitrate plant No. 2?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. That was the object of constructing that power plant—to furnish power?

Maj. BURNS. Not complete power.

Mr. WRIGHT. Not complete power, but to furnish power?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. And the option contained in that contract with the Alabama Power Co. provides that the Alabama Power Co. can become the purchaser of the Warrior steam plant?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. In other words, it is purely an option. In reference to the language you read a while ago, to the effect that the Government agrees to sell this plant to the Alabama Power Co., and the Alabama Power Co. agrees to buy it from the Government, those are mutual terms to make an option binding?

Maj. BURNS. What I read was only a part of the sales clause.

Mr. WRIGHT. Whoever drew the contract wanted to avoid a one-sided contract. There must be a mutuality. The Government agreed to sell it, and the Alabama Power Co. agreed to buy it, so at last it simply was an option.

Maj. BURNS. I do not understand it that way. I read you only a part of the sales clause.

Mr. WRIGHT. That is the option feature of it.

Maj. BURNS. That is one option feature.

Mr. WRIGHT. You understand that an option is a privilege by which one party agrees to do or not to do a certain thing. Do you undertake to say that if the Government would offer this plant to the Alabama Power Co. that the Alabama Power Co. would be bound to appoint an arbitrator as a member of the board to fix the value of the plant, and that the Alabama Power Co. would be bound to accept the award, or could they not just say we want to accept it?

Maj. BURNS. There is a very long clause pertaining to the method of selling that plant, and what I read to-day was only a small extract from the sales clause.

Mr. WRIGHT. In the light of all that has transpired—and I am not criticizing what was done during the emergency—can you not now see that it was the purpose of the Air Nitrates Corporation, which had an option in its contract to buy nitrate plant No. 2, and in the contract of the Alabama Power Co., which contained an option for it to buy the steam plant at Warrior, that it was simply a long-sighted, shrewd, ingenious idea to tie up the Government so that it could not dispose of these properties except these companies were the purchasers; in other words, it gave them the key to the situation?

Maj. BURNS. I can not subscribe to that.

Mr. WRIGHT. Does it not do that by the very terms of the contract?

Maj. BURNS. No, sir; I think not.

Mr. WRIGHT. You have just said the Government could not accept this contract with Mr. Ford because of the contract it has with the Alabama Power Co.

Maj. BURNS. But I also said the Warrior plant was not a vital part of the Muscle Shoals project.

Mr. WRIGHT. The fact is, it is included in the proposition.

Maj. BURNS. Yes, sir.

Mr. WRIGHT. You recited that as a reason why the Ford proposition can not be accepted?

Maj. BURNS. Yes, sir.

Mr. WRIGHT. Because of that clause in the contract with the Alabama Power Co.?

Maj. BURNS. That would be only—

Mr. WRIGHT (interposing). Do you not now see it was the purpose of the Alabama Power Co. in inserting this option clause to so tie up the Government that it could not dispose of this property except to it?

Maj. BURNS. It was undoubtedly the intention to tie up the Gorgas plant; but by that they did not, as I see it, put any restrictions upon the sale of nitrate plant No. 2.

Mr. WRIGHT. I am talking about the power plant. Do you not further realize that the Alabama Power Co. has practically a monopoly of the hydroelectric power in that region, and can you not see that they do not want a competitor to come into that field? Can you not see that they put this clause in to keep down competition and to prevent further developments being made down there?

Maj. BURNS. In all fairness to the Alabama Power Co.—

Mr. WRIGHT (interposing). I am talking about what you now see.

Maj. BURNS. I can not make an answer to that question by simply saying yes.

Mr. WRIGHT. Do you not further see that the American Cyanamid Co. is in the market manufacturing the identical product that nitrate plant No. 2 was designed to manufacture?

Maj. BURNS. That is correct.

Mr. WRIGHT. Can you not see that it is proposed in this construction contract whereby they agree to build nitrate plant No. 2 to also insert a clause which would tie up the hands of the Government so that the Government can not get into competition with the American Cyanamid Co., and can not sell this land to anybody who would come in competition with them?

Maj. BURNS. I should say that would be reasonable, businesslike protection.

Mr. WRIGHT. So far as the American Cyanamid Co. was concerned.

Maj. BURNS. Yes, sir.

Mr. WRIGHT. What do you think about the Government?

Maj. BURNS. It does not seem to me that the Government has the right—

Mr. WRIGHT (interposing). You are a business man of very wide experience?

Maj. BURNS. I am not a business man, and I doubt if I am a man of very wide experience.

Mr. WRIGHT. You would not say that a man of very wide business experience would enter into a contract like that for the Government?

Maj. BURNS. I think that contract is all right from the standpoint of the Government.

Mr. WRIGHT. Can you see anything in it for the Government except to get nitrate purely as an emergency feature, and the other feature was not looked out for at all?

Maj. BURNS. No, sir; I would not go as far as that.

Mr. WRIGHT. If it develops that the Alabama Power Co., the American Cyanamid Co., and the Air Nitrates Corporation are practically one, that the stockholders are practically the same, that the companies are simply organized under different names, then you can readily see why these contracts were entered into, can you not? I am asking you if that be true—

Maj. BURNS (interposing). I do not believe I could answer that question, because I think the hypothesis is wrong.

Mr. WRIGHT. The maintenance and operation of the steam plant is not at all essential to the conduct of these plants down there at Muscle Shoals; is that not true?

Maj. BURNS. In my judgment, it is not.

Mr. WRIGHT. There is adequate power now from the steam plant constructed by the Government in all these plants, and what may be received from dam No. 1 and dam No. 2, to supply these plants?

Maj. BURNS. Yes; there is almost enough power available at the steam plant No. 2 alone.

Mr. WRIGHT. And with the construction of dam No. 2 you can abandon the power connected with the steam plant?

Maj. BURNS. Absolutely.

Mr. WRIGHT. You do not regard the Gorgas power plant as at all essential to the successful operation of these plants at Muscle Shoals?

Maj. BURNS. I do not; no, sir.

Mr. WRIGHT. You think you can salvage that for \$3,000,000?

Maj. BURNS. I do; yes, sir.

Mr. STOLL. Where does plant No. 1 get its power?

Maj. BURNS. There was a small power plant erected with a capacity of 5,000 kilowatts.

Mr. STOLL. Where does plant No. 2 get its power?

Maj. BURNS. Its principle source of power—

Mr. WRIGHT. If the gentleman will pardon me, I have one other question I omitted to ask the Major.

Mr. STOLL. Certainly.

Mr. WRIGHT. Major, you said the Alabama Power Co. was intended to furnish hydroelectric power.

Maj. BURNS. They furnish both hydroelectric and steam power.

Mr. WRIGHT. Then it is a power proposition, pure and simple.

Maj. BURNS. According to my understanding, it is.

Mr. WRIGHT. If the Air Nitrates Corporation is given the right to buy this nitrate plant No. 2 according to the terms of the contract with the Government, then the Government would have no use for dam No. 2, known as the Wilson dam, because it would have no way to use the power.

Maj. BURNS. Of course, power can be used for a great diversity of things.

Mr. WRIGHT. But you do not know of any market unless it was used for the operation of the nitrate plant.

Maj. BURNS. I do not personally know of any; no, sir. But I have heard the testimony of Mr. Cooper, and he claims that the general country down there can easily utilize the power that would be developed at Muscle Shoals.

Mr. WRIGHT. The idea is that the nitrate plant No. 2 and Dam No. 2 are supposed to be built in conjunction, so far as the Government proposition is concerned, and one depends on the other. So that if the Government disposes of nitrates plant No. 2 to the Air Nitrates Corporation, would there be any market for the power produced at Dam No. 2, except the Alabama Power Co.?

Maj. BURNS. As I said before, the testimony of Mr. Cooper indicated there would be abundant use for power over and above the market at the No. 2 nitrate plant.

Mr. STOLL. Plant No. 2 has its own steam plant to produce its power?

Maj. BURNS. It is expected that that will be almost enough to run the entire plant.

Mr. STOLL. Who owns the right of way between the Gorgas Plant and Muscle Shoals?

Maj. BURNS. The Alabama Power Co.; I do not know whether they have a complete title, but they either own it or they have control of the land.

Mr. STOLL. They own no other land at Muscle Shoals?

Maj. BURNS. Not to my knowledge.

Mr. STOLL. Where is the principal place of business of the Alabama Power Co.—I do not mean its office?

Maj. BURNS. I can only give you my general information. I believe most of their hydroelectric power is generated at what is known as Lock No. 12 on the Coosa River. They have steam plants scattered around to back up the hydroelectric power, and one of those is their plant at Gorgas.

Mr. STOLL. How much money has the Alabama Power Co. put into the Gorgas steam plant?

Maj. BURNS. My judgment is that it is well in excess of \$3,000,000.

Mr. STOLL. You stated, I believe, that the Alabama Power Co. built a part of the plant and that the Government built the other part of the plant?

Maj. BURNS. Yes, sir.

Mr. STOLL. The Alabama Power Co. has no money in the part that the Government built?

Maj. BURNS. No, sir; except that they own the land.

Mr. STOLL. They had a profit of something like \$285,000 on the construction of that plant for the Government?

Maj. BURNS. That is correct; yes, sir; if you include the overhead fee of \$60,000 as profit.

Mr. STOLL. How much has the Government invested in Muscle Shoals?

Maj. BURNS. Nitrate plant No. 2 represents an investment of approximately \$70,000,000; nitrate plant No. 1 represents an investment of practically \$13,000,000;; the Wilson Dam——

Mr. STOLL. The Government has an investment there of something over \$100,000,000, has it not?

Maj. BURNS. When we consider plant No. 1, plant No. 2, Gorgas power plant, and the dam, it is, roughly, \$105,000,000.

Mr. STOLL. The Government in its operation of Muscle Shoals is to generate electric power to manufacture nitrates for the Ordnance Department and to manufacture nitrates to use in making fertilizer? That is the principal function of the Government at Muscle Shoals, is it not?

Maj. BURNS. Those plants were put up during the war for the purpose of manufacturing explosives.

Mr. STOLL. As it stands to-day, if it is developed it will be for electric power, explosives, and fertilizer.

Maj. BURNS. Those three could be produced.

Mr. STOLL. They have already invested there about \$100,000,000?

Maj. BURNS. Yes, sir.

Mr. STOLL. What does the Alabama Power Co. develop?

Maj. BURNS. Power.

Mr. STOLL. That is one of the elements which the Government will develop?

Maj. BURNS. Yes, sir.

Mr. STOLL. What does the Air Nitrates Corporation develop?

Maj. BURNS. They are engaged principally in the manufacture of fertilizer materials.

Mr. STOLL. That is another element the Government would develop?

Maj. BURNS. Yes, sir.

Mr. STOLL. What does the American Cyanamid Co. develop?

Maj. BURNS. It is a company that develops fertilizer materials. The Air Nitrates Corporation is a subsidiary of the American Cyanamid Co.

Mr. STOLL. The only three companies that have an interest at Muscle Shoals, outside of the Government interests, develop power and ingredients of fertilizers?

Maj. BURNS. That is correct.

Mr. STOLL. How much money has the Air Nitrates Corporation invested in Muscle Shoals?

Maj. BURNS. None, so far as I know.

Mr. STOLL. How much has the American Cyanamid Co.?

Maj. BURNS. In so far as I know, they are in a similar position. Neither combination has any money invested.

Mr. STOLL. Whose interest do you think is paramount—the Government's, with over \$100,000,000 invested there, or the interests of the Alabama Power Co., with a few million dollars invested?

Maj. BURNS. I think, without doubt, the Government's interest is always paramount.

Mr. STOLL. If the two interests conflict, whose interests must we look after?

Maj. BURNS. I think you must always look after the Government's interests.

Mr. STOLL. When you say we are under obligations to the Alabama Power Co. and, in your opinion, this Ford offer should be rejected rather than break a contract with the Alabama Power Co., your opinion is based more on a desire to save, as it were, the skin of the Ordnance Department for entering into a foolish contract than it is concerned with the rights of the Government to go ahead and do this particular thing?

Maj. BURNS. Not necessarily. I think the Government's interests, as a matter of policy, would be best protected if it insisted upon living up to the Alabama Power Co.'s contract. I do not think you can always measure the Government's interest in dollars and cents.

Mr. STOLL. But we are considering this proposal from the standpoint strictly of Mr. Ford's offer, whether the Government should take the Ford offer, and in considering that there has been brought in the contract with the Alabama Power Co., so we are considering that contract solely in the light of the Ford offer, and you stated that you thought that ought to be thrown aside to protect the interests of the Alabama Power Co.

Maj. BURNS. Yes, sir; I made that statement.

Mr. STOLL. Suppose the Ford offer, in the opinion of Congress, would be beneficial to the Government, saving what they have already invested in producing elements that would be beneficial to the Government in time of war as well as in time of peace. Do you think the contract with the Alabama Power Co. is so paramount that you could let those other things go in order to protect them?

Maj. BURNS. If you take the stand that the Ford offer is of vital benefit to the United States, I can see only one conclusion to come to, and that is to accept the offer. But I do not take that stand.

Mr. STOLL. That is a hypothetical question, because we are considering the Alabama Power Co. solely in view of its relation to the Ford offer, and not what we would do with the Alabama Power Co. otherwise.

Maj. BURNS. My judgment is it would be to the best interests of the Government to live up to the contract.

Mr. STOLL. That is not the question. The question is, if the Ford offer is the best interest for the Government—

Maj. BURN. (interposing). You have made your answer.

Mr. STOLL. You think the Alabama Power Co.'s right should offset that?

Maj. BURNS. If you make that assumption to start with, you have also written the answer, I think.

Mr. STOLL. Then, you do not consider the Alabama Power Co.'s right necessarily so strong it would offset the Ford offer?

Maj. BURNS. I do; but you are assuming that it is not, and, therefore, you get another answer.

Mr. STOLL. Perhaps you did not catch the drift of my question.

Maj. BURNS. I think I did. You are assuming that the Ford offer is of paramount importance to the Government.

Mr. STOLL. No; I say if it is to the best interests of the Government, or if the Ford offer is good.

Maj. BURNS. If I understand your question, you put it this way: If it is to the best interest of the Government to accept this Ford offer, should we throw over the Alabama Power Co. contract? I say, if you believe it is to the best interests of the Government to accept the Ford offer as drawn you have written your answer.

Mr. STOLL. Suppose there is no controversy over the Alabama Power Co. at all; suppose there is no question about the Alabama Power Co.—that they have no claim—would you think the Ford offer good?

Maj. BURNS. It all depends on the point of view. If I were a farmer and had the farmers' interests solely at heart, I would say that the Ford offer is good. If I were a fertilizer man and had only the fertilizer interests at heart, I would say that the Ford offer is not good.

Mr. STOLL. Why?

Maj. BURNS. Because there is a great possibility of the Ford offer hurting the fertilizer business and the people who have their money so invested.

Mr. STOLL. By cheapening fertilizer?

Maj. BURNS. There is a possibility of that.

Mr. STOLL. Then from the standpoint of agriculture it would be a benefit?

Maj. BURNS. It has possibilities of benefits; yes, sir.

Mr. STOLL. I am glad you have made that statement. From the standpoint of developing the country down there through the use of electricity—

Maj. BURNS (interposing). In that case, also, in my judgment, the Ford offer has great possibilities.

Mr. STOLL. And from the other standpoint of providing in a permanent way, ready at all times to make the nitrates that your department needs in time of war, it would be beneficial from that standpoint?

Maj. BURNS. Yes, sir; it would.

Mr. STOLL. Then from every standpoint, leaving out the contract with the Alabama Power Co., the Ford offer is good.

Maj. BURNS. It has great possibilities; yes, sir.

Mr. STOLL. You have just admitted it was good.

Maj. BURNS. I did not say from every standpoint except one. That is where you put in a proviso I did not include.

Mr. STOLL. The fertilizer, the electrical power, and the explosives that you use in time of war are the only three elements involved; and if the thing is good, if the Alabama Power Co. had no contract, the interests of the Government at all times being paramount, why should we now throw it aside on account of this alleged interest of the Alabama Power Co.?

Maj. BURNS. My own judgment of that is that the Government should set the foremost example in living up to its contracts, and I think that is a greater matter of policy than anything else.

Mr. STOLL. But you just admitted that the Government's interest is paramount, and you admit that if these other things are true it would be for the good of the country.

Maj. BURNS. No; I did not say that. I said from certain points of view it would be good, and from other points of view it would not be good. I did not make the summarized statement.

Mr. STOLL. I think you have about admitted yourself out of court. That is all.

Mr. FIELDS. There is one question I overlooked, Major. The Government furnished the Air Nitrates Corporation the funds on which it operated, did it not, in the construction of nitrate plant No. 2?

Maj. BURNS. Yes, sir.

Mr. FIELDS. And all the other plants that were built?

Maj. BURNS. Yes, sir.

Mr. FIELDS. What was the total claim of the Air Nitrates Corporation for the construction done for the Government?

Maj. BURNS. \$1,500,000.

Mr. FIELDS. And they all applied to nitrate plant No. 2.

Maj. BURNS. Yes, sir; they could all be applied against that plant.

Mr. FIELD. Including the other plants, 3 and 4, what was the total for the entire construction program?

Maj. BURNS. \$1,500,000. They earned their complete fee when \$80,000,000 was expended, and since \$70,000,000 was expended on No. 2 plant alone, that of itself earned for them the entire fee.

Mr. FIELD. This corporation, like the Alabama Power Co., also secured an option for the purchase of nitrate plant No. 2?

Maj. BURNS. Yes, sir.

Mr. FIELD. Do you feel that that places upon the United States the same moral obligation that the option of the Alabama Power Co. carries?

Maj. BURNS. I do not think that option is so important, because one of the provisos of that option is that they must agree to pay to the Government as good a return as the Government can get from somebody else.

Mr. FIELDS. If they come in and claim their right to purchase nitrate plant No. 2 just like the Alabama Power Co. claims its right to purchase the Gorgas plant, you think that the Government should also live up to that proposition?

Maj. BURNS. Yes, sir; I think there is an obligation also there to live up to the contract.

Mr. FIELDS. And are you aware of the fact that when the Government submitted to Mr. Duke, the moving spirit of the Air Nitrates Corporation and the American Cyanamid Co., an invitation to submit a proposition for the lease or purchase of nitrate plant No. 2, that he at that time declined to submit a proposition, condemned the operation of plant No. 2, either by the Government

or by private interests, and also recommended against the completion of dam No. 2; are you aware of that fact?

Maj. BURNS. I heard the letter read a day or so ago.

Mr. FIELDS. Was not the Alabama Power Co. included in that association of southern producers of power which also submitted to the Secretary of War a long letter recommending against the completion of Dam No. 2 and the operation of nitrate plant No. 2?

Maj. BURNS. I did not know their name was included in that association of power producers.

Mr. FIELDS. It is not clear in my mind whether it was or not.

Maj. BURNS. I did not hear it read.

Mr. FIELDS. I can hardly see where you distinguish between the option of the Alabama Power Co. and the option of the Air Nitrates Corporation on nitrate plant No. 2. If one is a binding obligation on the Government, it seems to me from your viewpoint the other would be binding upon the Government.

Maj. BURNS. I appreciate your point, but as I said before, the American Cyanamid Co. can not buy that plant unless it is willing to give as good a return to the United States as the United States is able to get from any other person. It is my own judgment that the American Cyanamid Co. would not give the United States what Mr. Ford is agreeing to give. Therefore, I feel, without knowing the facts in the case, that the American Cyanamid Co.'s option is not going to be any impediment at all.

Mr. FIELDS. In line with the questions asked by Mr. Stoll a moment ago, I will ask you, eliminating the Alabama Power Co. and the manufacturers of fertilizers in the country, to which you yourself referred, what is your opinion as a military man of the completion of Dam No. 2 and the development and operation of nitrate plant No. 2 from the standpoint of preparedness; is that of interest to the Government?

Maj. BURNS. Yes, sir; it is. I would like very much to see the dam completed and the plant operated.

Mr. FIELDS. What would be the annual cost of the maintenance of nitrate plant No. 2 in an idle stand-by condition?

Maj. BURNS. We are keeping it this year for a cost of about \$125,000, with the additional proviso, however, that we are leasing the power plant for a fixed rental of \$120,000 a year and an additional probable return of \$140,000.

Mr. FIELDS. And if the Government should continue this operation for 20 years, what money would it have to expend for reinstallation and improvement of the plant?

Maj. BURNS. I can not answer that question, Mr. Fields, because it all depends on the life which you give to the plant in standby. It might all go to pieces in 10 years or it might not go to pieces for 50 years.

Mr. FIELDS. Is it not a fact from the standpoint of national preparedness that the Ford offer would be a great saving to the Government in the end, not including the 4 per cent interest on the investment, and the sinking fund, and the allowances for the maintenance of locks and dams Nos. 2 and 3, by reason of the fact that he must himself keep this plant in condition to operate, and turn it over to the Government upon five days' notice at any time the Government may want it.

Maj. BURNS. I think it would.

Mr. FIELDS. There is a very great element of cost there that must be met by Mr. Ford if he takes over the proposition in order to keep that plant in condition for the Government.

Maj. BURNS. He undoubtedly would bear the burden that the Government would otherwise have to bear or might have to bear.

Mr. FIELDS. If the Government should bear the burden of maintaining this plant in the condition that Mr. Ford proposes to maintain it, for the life of the proposed Ford lease, it would necessitate an expenditure of millions and millions of dollars on the part of the Government, would it not?

Maj. BURNS. It probably would. I would like to qualify that statement in this way: The Government, in my opinion, would only hold nitrate plant No. 2 until the business of nitrogen fixation was developed in America to such an extent that it could be depended upon. If it was never developed within 100 years, that might mean that the Government would retain that plant for 100 years. If, however, nitrogen fixation were an accomplished fact on a big business basis in 10 years, the Government would not be justified in carrying the plant any longer than 10 years.

Mr. FIELDS. Your proposition hangs upon the possibility of the development of nitrogen fixation by private capital?

Maj. BURNS. Yes, sir.

Mr. FIELDS. There is just one other question that has been overlooked, in my judgment, all the way through that I desire to ask you about. What is the distance of the haul by water of Chilean nitrates from the Chilean mines?

Maj. BURNS. Roughly, 4,000 miles.

Mr. FIELDS. That is, through the canal?

Maj. BURNS. Yes, sir.

Mr. FIELDS. In time of stress, if the canal should for any reason be put out of commission, then what would be the distance?

Maj. BURNS. It might not be so very much greater, because in that instance you might take it up to the California coast and ship it across the continent by rail. If, however, you had to go around the Cape, I should imagine your distance would be at least doubled.

Mr. FIELDS. I just wanted to get that in the record. That is all.

Mr. McKENZIE. Major, we are very much obliged to you, and the committee will now take a recess until 2.30 o'clock p. m.

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Monday, February 13, 1922.

AFTER RECESS.

The committee met pursuant to recess at 2:30 o'clock p. m.

STATEMENT OF MR. WILLIAM B. MAYO, CHIEF ENGINEER OF THE FORD MOTOR CO., DETROIT, MICH.

The CHAIRMAN. Gentlemen of the committee, this is Mr. Mayo, who represents Mr. Ford in this proposition. He has come here from Detroit and desires to be heard regarding the matter.

Will you kindly state your name in full?

Mr. MAYO. William B. Mayo.

The CHAIRMAN. And also explain the position you occupy?

Mr. MAYO. Chief engineer of the Ford Motor Co.

The CHAIRMAN. How long have you been with Mr. Ford?

Mr. MAYO. About eight years.

The CHAIRMAN. Are you acquainted with the Muscle Shoals development?

Mr. MAYO. Fairly well, I think.

The CHAIRMAN. To what profession do you belong? Are you an engineer?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And you have been acting as an engineer for Mr. Ford?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Are you familiar with the offer that Mr. Ford made for the Muscle Shoals plant?

Mr. MAYO. Yes, sir. --

The CHAIRMAN. It will not be necessary, therefore, to call your attention to the contract or the proposal that he has submitted.

Mr. MAYO. I think not.

The CHAIRMAN. Of course, the first proposal he submitted on July 8, 1921, he has asked to be superseded by a later proposal which he signed January 25.

Mr. MAYO. Yes, sir.

The CHAIRMAN. And gave to the Secretary of War on January 27.

Mr. MAYO. Yes, sir.

The CHAIRMAN. The committee has a few matters about which they have insufficient information, and they would like you, if possible, to tell just what Mr. Ford proposes to do. There is nothing said in the proposal regarding the company of which Mr. Ford speaks, whether it is going to have a capital stock or not; what the capital stock will be, if they propose to have capital stock; could you inform the committee regarding that matter?

Mr. MAYO. Mr. Ford has not fully determined whether he will operate as a company or under his own name.

The CHAIRMAN. Or under his name?

Mr. MAYO. He has not fully determined which way he will operate, yet.

The CHAIRMAN. He has not?

Mr. MAYO. No, sir.

The CHAIRMAN. If he should operate as a company do you think he will operate with a certain amount of capital stock?

Mr. MAYO. He will have to operate with sufficient capital to properly handle the business, certainly.

The CHAIRMAN. But you can not give the committee any idea of just what amount of capital that will be?

Mr. MAYO. Not other than to say it will be sufficient to properly conduct the business.

The CHAIRMAN. Will Mr. Ford be able to tell the committee of Congress before very long how much money he expects to organize for?

Mr. MAYO. I think likely; yes, sir.

The CHAIRMAN. It is the desire of the committee and the desire of Congress to get this thing through with as early as possible. How long do you think it would take Mr. Ford before he could let this committee know just how much capital stock he would organize for?

Mr. MAYO. I hardly think it would be fair to press him for a definite sum at this time, until he has worked out the needs of the company.

The CHAIRMAN. How long a time do you think he would require?

Mr. MAYO. He is going through the process of working out several schemes in handling the plant as a whole, and it is rather difficult to determine what amount is needed until he finally decides on a definite course of procedure.

The CHAIRMAN. That is one of the matters that the committee have expressed a desire to know about, and that is why I am asking you the question.

Mr. MAYO. I understand, but I do not quite get the point. I do not see how the amount of capital necessarily enters into it.

The CHAIRMAN. I think one of the witnesses, or one of the members of the committee, tried to show two or three days ago that there were 10 gentlemen who organized the Air Nitrates Corporation, or some organization of that kind, and put up \$100 apiece and organized for a very large amount. While, of course, Mr. Ford does not anticipate anything of that kind, yet I think the committee would like to know about how much he would want to incorporate for.

Mr. PARKER. Mr. Chairman. I think they would want to know the least amount that he would incorporate for.

Mr. MAYO. It goes without saying that he could not operate without placing \$5,000,000 there.

The CHAIRMAN. That is the amount he is willing to pay for nitrate plant No. 2.

Mr. MAYO. And having paid his \$5,000,000, he necessarily must furnish the necessary additional capital to operate, so that if there could be a minimum amount named, the cost plus the operating capital to start with would be the minimum figure.

The CHAIRMAN. You, at least, have no definite knowledge upon that subject?

Mr. MAYO. No; that has not been determined as yet.

The CHAIRMAN. The committee also expressed some desire to know this: The Secretary of War stated to the committee that he had had some interviews with Mr. Ford, and that on one occasion at least Mr. Ford told him that if he could not make fertilizers profitably he would cease the work entirely. Does that express Mr. Ford's view?

Mr. MAYO. I think it necessarily follows that if you operate continually at a loss you would soon go out of business; that is the natural sequence. He did not try to lead the Secretary to believe that he would stop making fertilizer and manufacture something else.

The CHAIRMAN. But I think in his offer he speaks of nitrate plant No. 2.

Mr. MAYO. Yes, sir.

The CHAIRMAN. He agrees to keep that going for 100 years.

Mr. MAYO. Yes, sir.

The CHAIRMAN. I think the testimony before the committee is that that plant makes a nitrate which can be used for making fertilizers?

Mr. MAYO. Yes, sir.

The CHAIRMAN. Would you stop operating the plant altogether if the manufacture of nitrates should be unprofitable?

Mr. MAYO. I do not quite understand you.

The CHAIRMAN. You said that if he could not manufacture nitrates profitably to make fertilizers, he would have to go out of business. Now, he makes a positive offer on nitrate plant No. 2.

Mr. MAYO. Yes, sir.

The CHAIRMAN. And offers to turn it over at a moment's notice for the use of the Government in case the Government should require him to manufacture explosives. Now, I understand from the evidence before the committee that they manufacture nitrates at this plant?

Mr. MAYO. Yes, sir.

The CHAIRMAN. And that the nitrate is used as a component part of the fertilizer. Now, would he stop making that in case it should be unprofitable?

Mr. MAYO. If it was unprofitable he might have to switch to some other process.

The CHAIRMAN. That is his idea?

Mr. MAYO. Oh, yes.

The CHAIRMAN. You do not think he would quit running the plant if the profits were not as big as he had anticipated?

Mr. MAYO. He has not that kind of a record.

The CHAIRMAN. I quite agree with you. He speaks of the land and flowage rights necessary for Dam No. 3. I think the testimony before the committee is to the effect that the amount required for the acquisition of those rights will be in the neighborhood of \$4,000,000. Do you think he would be willing to allow 4 per cent to the Government for anything that is laid out for that purpose?

Mr. MAYO. I do not think so. I think the amount you stated, though, is very high. I notice the Government estimate is \$2,331,000. We had estimated a maximum amount of not over \$1,500,000 and we are quite sure it will not run over \$1,000,000.

The CHAIRMAN. For the flowage rights.

Mr. MAYO. Mr. Ford had thought that the necessary amount ought to be charged to navigation.

The CHAIRMAN. To what?

Mr. MAYO. To navigation.

The CHAIRMAN. He does not think he should be called upon to assume any of that, not even to the extent of paying 4 per cent interest?

Mr. MAYO. He has not thought so, so far; no, sir.

The CHAIRMAN. It has been suggested that if Mr. Ford should acquire this property, any power he might sell from the Muscle Shoals plant ought to be developed and he should be required to dispose of it on the terms and conditions imposed by the Federal Power Commission or the public service corporation commission of Alabama. Do you know whether Mr. Ford has given that matter any thought?

Mr. MAYO. He has, and it has always been our impression that we would probably come under the State of Alabama law.

The CHAIRMAN. That is his impression at this time?

Mr. MAYO. Yes, sir.

The CHAIRMAN. You would be perfectly able and willing to sell the power in that way?

Mr. MAYO. So far as I know; yes, sir.

The CHAIRMAN. In reference to the 100-year agreement, there seems to be a difference of opinion whether the agreement should run for 50 years or 100 years.

Mr. MAYO. Yes, sir.

The CHAIRMAN. The Secretary of War notified this committee that he was under the impression that it ought to be limited to 50 years and that any effort to extend beyond that period would not be good public policy.

Mr. MAYO. Yes, sir.

The CHAIRMAN. Have you thoroughly thought out that matter?

Mr. MAYO. Mr. Ford has given that a great deal of thought and he thinks that very few really know the magnitude of this project, and, as he proposes to use all this power himself, eventually, it will take a very large investment down there and quite a few years to build up to it.

The CHAIRMAN. He proposes to use all the power himself?

Mr. MAYO. He expects to.

The CHAIRMAN. That is a pretty big proposition, is it not?

Mr. MAYO. We realize it; yes, sir. The point is if the offer is accepted we will have such a very large investment at Muscle Shoals in the course of the next 10 or 15 years that we could not afford to risk that much of an investment there and run the risk of having the power end of it cut from under your feet at the end of 50 years.

The CHAIRMAN. Personally, I do not think—

Mr. MAYO (interposing). It is different from a great many projects, in that the Muscle Shoals district is more or less of a virgin country, and we have to develop everything there.

The CHAIRMAN. I do not think that is a very serious complaint. For myself, I am perfectly willing to stand by a 100-year agreement.

Mr. MAYO. In general, that is his thought. Mr. Ford has a \$5,000,000 investment to start with, and to my mind that is but a drop in the bucket. That is

why I also think the amount of capital is hardly worth talking about at this time.

The CHAIRMAN. That is not a very material matter, in your opinion?

Mr. MAYO. Not at all. The investment will be so very large that there will always be plenty for the Government or anybody else to hold in case of trouble.

The CHAIRMAN. How many years do you think it will take for the investment to be fully developed?

Mr. MAYO. Well, it is pretty hard to venture a guess; I would say in 15 or 18 years, or some such time.

The CHAIRMAN. The world has not known very much about this matter of the fixation of nitrogen very long, has it?

Mr. MAYO. No, sir.

The CHAIRMAN. And you are willing to take all this chance with the limited knowledge that the world has of the proposition?

Mr. MAYO. Well, Mr. Ford does not think he is taking much chance.

Mr. MCKENZIE. Mr. Mayo, one of the propositions involved in the Ford offer, and one which has been giving us no little concern, is what is known as the Gorgas or Warrior River plant owned and operated by the Alabama Power Co.

Mr. MAYO. I understand.

Mr. MCKENZIE. What is your idea as to the absolute necessity of including the Warrior River plant of the Alabama Power Co.'s project in Mr. Ford's offer.

Mr. MAYO. The real necessity as he looks at it is to have the steam power during the low-water period so as to increase the primary power.

Mr. MCKENZIE. Does he feel it is absolutely essential, at least for many, many years to come, to have the additional power that would be furnished by this Warrior River power plant?

Mr. MAYO. It is more essential now than it will be later.

Mr. MCKENZIE. You are perfectly familiar with the situation down there at the Gorgas plant, I take it.

Mr. MAYO. I think so.

Mr. MCKENZIE. You know how it is constructed?

Mr. MAYO. Fairly well. I have never seen it.

Mr. MCKENZIE. From a description given here this morning by an Army officer, it is more intricately woven into the property and interests of the Alabama Power Co. than the League of Nations was in the treaty of Versailles, and it would be almost impossible, so it strikes me, as a member of this committee, to undertake to separate the interests of the Government from the interests of the Alabama Power Co., and that would necessitate possibly the taking over of the rights of the Alabama Power Co.

Mr. MAYO. That might be, but we never thought so.

Mr. MCKENZIE. And this officer stated it would be practically impossible to unscramble the rights of the Government from those of the Alabama Power Co., and it had been my hope, at least, as one of the members of the committee, that we might bring about some acceptance of this offer without this complication—that is, that some acceptance of the offer might be arrived at between Mr. Ford and representatives of the Government which would very materially simplify the whole proposition, but you say you have not looked into that matter very closely, as I understand it.

Mr. MAYO. Not so very, but we have always been of the opinion it could be unscrambled all right.

Mr. MCKENZIE. But in your proposed contract you put the responsibility of the unscrambling on the Government.

Mr. MAYO. I know it.

Mr. MCKENZIE. And that is one of the propositions included in your offer?

Mr. MAYO. Yes, sir.

Mr. MCKENZIE. And your offer must either stand or fall on the Government delivering the property it contracts to deliver to Mr. Ford. Now, then, if we should get into litigation and it should be held by the courts that the Government could not deliver this property to Mr. Ford, then all of our work would have been in vain.

Mr. MAYO. I see.

Mr. MCKENZIE. Because the whole proposition would fall.

Mr. MAYO. I am sure Mr. Ford does not expect to ask the Government to do anything that is physically impossible.

Mr. MCKENZIE. I think that is true.

Mr. MAYO. He thinks it can be worked out. If it can be shown him——

Mr. McKENZIE (interposing). I have wondered whether Mr. Ford is thoroughly familiar with the existing condition of things at that plant.

Mr. MAYO. I would not say he was thoroughly familiar but quite familiar, and he is of the opinion it can be worked out.

Mr. McKENZIE. As a simple offhand proposition, not knowing any of the details, I felt at first, when I read the offer, "that is all right; that is easy enough; we will just turn that over;" but there is more than that to it, it is the most difficult proposition, in my judgment, the way the thing has been constructed, whether intentionally or otherwise, and the Alabama Power Co. have themselves fortified in a position, that is most lamentable, in my judgment, in connection with this whole proposition; to be as charitable as possible, I would say that.

Mr. MAYO. I see.

Mr. McKENZIE. It would probably cost the Government more than Mr. Ford's entire offer of \$5,000,000 in order to be able to deliver to him this one element of the contract, to say nothing of the other property which we would expect to deliver to him. Now, in speaking of the manufacture of this element which can be used in the manufacture of fertilizer, and without using any of the technical or chemical terms, I will simply speak of it as nitrate, which can be produced at Muscle Shoals, and I understand you to say that as long as it is profitable or can be produced without a loss Mr. Ford would be glad to continue to produce that product.

Mr. MAYO. Yes, sir.

Mr. McKENZIE. And I think you stated it very correctly when you said that it is a fair assumption that if it was being produced at a loss it would only be a matter of time when even Mr. Ford, with all his wealth, would go out of business, and therefore the element of profit or the cost of manufacture has to be taken into consideration.

Mr. MAYO. Yes, sir.

Mr. McKENZIE. The price of fertilizer, I take it, the same as the price of any other product, is fixed ordinarily, under the laws of trade, by competition.

Mr. MAYO. Yes, sir.

Mr. McKENZIE. And in this country we have certain manufacturers of fertilizer. That rule, however, can be overcome by what is known as combinations or trusts, and if all the fertilizer manufacturers of the country, including Mr. Ford, would enter into a trust, they could fix the price of fertilizer in this country. I am not assuming that Mr. Ford is a believer in the forming of trusts to put up a price of a commodity to the people of this country, but that could be done, and if that is done, of course, then the only competitor that Mr. Ford would have or the other manufacturers of this so-called fertilizer would be the importations from Chile and other outlying countries, is not that true?

Mr. MAYO. Yes, sir.

Mr. McKENZIE. Now, as a matter of fact, knowing Mr. Ford as you do, have you any fear in your mind that with his splendid organization he could not compete successfully with the other manufacturers in this country.

Mr. MAYO. I am absolutely sure of it.

Mr. McKENZIE. In the production of that product.

Mr. MAYO. I am absolutely sure that he could do so.

Mr. McKENZIE. Then the only thing he would have to fear, of course, and which might put him out of business, would be the low price of imported nitrate.

Mr. MAYO. I do not have any fear of that.

Mr. McKENZIE. I think I agree with you on that, but if that should happen, then the American agricultural people would not hold Mr. Ford responsible for not selling fertilizer to them at a higher price, but would be glad to have it imported from a foreign country at even a lower price than Mr. Ford could produce it.

Mr. MAYO. Yes.

Mr. McKENZIE. So there would really be no great harm done under those circumstances if Mr. Ford ceased to manufacture fertilizer; is that true?

Mr. MAYO. That is true, but I think it goes without saying that he could find some process wherein he could meet any competition. We consider the plant so situated naturally, and with the very cheap power, that you have all the fundamentals with which to make a very cheap fertilizer.

Mr. McKENZIE. I think that is true, and the 8 per cent you would consider a fair measure of profit on the expenditures.

Mr. MAYO. We think so.

Mr. McKENZIE. And he is willing to be limited to 8 per cent?

Mr. MAYO. Yes, sir.

Mr. McKENZIE. I believe you have explained your views on the 100-year lease or franchise, and, of course, it goes without saying that if the Congress should determine they would not accept the 100-year proposition but would accept a 50-year proposition, that would involve an entire change of the whole offer made by Mr. Ford.

Mr. MAYO. Yes, sir.

Mr. McKENZIE. And would materially increase the cost to Mr. Ford and accordingly, in my judgment, depreciate the value of it to the Government.

Mr. MAYO. Yes, sir.

Mr. McKENZIE. In regard to the so-called guaranty in the proposed contract, and in relation to the questions asked by our chairman as to the necessity of having a capital stock named, I presume one of the reasons why Mr. Ford put into this contract that he was binding his heirs and assigns, as well as binding the corporation or company that might hereafter be created, goes to show that he has not at this time, as you say, made up his mind as to whether he will operate it as a company or corporation or as an individual.

Mr. MAYO. Yes, sir.

Mr. McKENZIE. And you feel that with the expenditure of money he will be immediately called upon to expend at this plant, that that would be a sufficient guaranty, as a matter of protection to the taxpayers of the country and the people of the county, without his putting up his individual bond or a guaranty of so much capital stock on the part of the company.

Mr. MAYO. Yes, sir. If you forced him to raise capital to an extent where he would have some idle capital lying by, that would naturally increase the cost of his product.

Mr. McKENZIE. That explains, then, to some extent, that provision in his proposal; is that the idea?

Mr. MAYO. Yes, sir.

Mr. MORIN. Do you agree that the estimate of cost of completing Dam No. 2 and building Dam No. 3 is accurately estimated by the Army engineers at \$50,000,000?

Mr. MAYO. I think that is considerably more than it will cost.

Mr. MORIN. Is it your judgment that the flowage rights which the Government is to acquire under the Ford offer can be purchased for the \$2,331,000 estimated by the Government engineers as the cost?

Mr. MAYO. I am of the opinion they can be secured for less.

Mr. MORIN. How much less?

Mr. MAYO. Not over \$1,500,000 total cost.

Mr. MORIN. It would not cost more than \$1,500,000?

Mr. MAYO. Not to exceed \$1,500,000.

Mr. MORIN. Would not this item be nearer \$5,000,000?

Mr. MAYO. I do not think so.

Mr. MORIN. Or \$10,000,000, or even more, considering present values of land and the necessity of acquiring lands for railway and terminal connections as imposed by Mr. Ford's offer?

Mr. MAYO. I do not think so; no, sir.

Mr. MORIN. What are these "railway and terminal connections"?

Mr. MAYO. The only thing I call to mind is the present track connections that now exist, with the possible addition of two single track lines to Dam No. 3, which need only be temporary, I should say.

Mr. MORIN. They are the only connections you recall?

Mr. MAYO. Yes, sir.

Mr. MORIN. On its amount, whatever its cost, Mr. Ford seemingly would pay no interest; is that your understanding?

Mr. MAYO. I do not follow you. You are talking about this track or right of way?

Mr. MORIN. Yes; the connections that would have to be secured there by the Government.

Mr. MAYO. They have already been secured; all except the rights of way to Dam No. 3. They exist at present.

Mr. MORIN. You will note that the Secretary of War recommends that this sum be included in the sum upon which Mr. Ford is to pay interest. His letter of transmittal states: "The omission of the cost of these lands from this computation is more serious than would be the omission of the provision for a sinking fund, for the annual interest at 4 per cent on the cost of such lands,

and rights if used for this purpose would amortize a sum much larger than that provided in paragraph 10 of Mr. Ford's proposal." What is your opinion of that?

Mr. MAYO. I think you are confusing that with the flowage rights for Dam No. 3.

Mr. MORIN. No; I do not think so.

Mr. MAYO. That subject has never been brought up, as I remember.

Mr. MORIN. The Secretary of War refers to it in his statement. What about the flowage rights for Dam No. 3, then?

Mr. MAYO. We are of the opinion that they can be purchased at a maximum sum of \$1,500,000, and the cost of that should be charged to navigation. That has been Mr. Ford's idea.

Mr. MORIN. Mr. Ford agrees to pay 4 per cent on the actual cost of acquiring lands and flowage rights, etc., in the case of Dam No. 2; that is correct, is it?

Mr. MAYO. I think it is.

Mr. MORIN. Are not those dams and flowage rights already paid for and acquired at Dam No. 2, and constitute a part of the \$17,000,000 already expended at that point?

Mr. MAYO. Most of them. I think a few parcels are under lease.

Mr. MORIN. Then, Mr. Ford does not intend to reimburse the United States for any part of the \$17,000,000, does he?

Mr. MAYO. Well, in our sinking fund, if the Government invests that sinking fund on the basis of, say, 4½ per cent, it would take care of over \$58,000,000 of cost. If the cost of the two dams, for instance, does not exceed \$40,000,000, then it would wipe out the entire \$17,000,000 that have been spent, and more.

Mr. MORIN. I hardly think that is an answer to my question. My question was whether Mr. Ford intends to reimburse the United States for any part of the \$17,000,000 under his proposal?

Mr. MAYO. I am of the opinion that I was answering that. We establish a sinking fund to wipe out the cost of this work, and we state the definite amount of that sinking fund. If the Government invests that on the basis of 4½ per cent—I did not read the figures right before—it will wipe out \$70,000,000 in the 100 years.

Mr. MORIN. Your idea is that he does propose to reimburse the Government?

Mr. MAYO. If we are fortunate to keep the cost of Dams No. 2 and No. 3 as low as, say \$40,000,000, then you will have \$30,000,000 left to wipe out the original investment, which you say is \$17,000,000.

Mr. MORIN. Mr. Ford's offer contemplates the free and unencumbered title to all of the property to be transferred to him, so that he contemplates paying no interest on any sums to acquire such clear title, whether by condemnation or otherwise; is that true?

Mr. MAYO. He pays interest on only the cost of the dams.

Mr. MORIN. This sum for clearing title may aggregate several million dollars, may it not?

Mr. MAYO. I do not think so.

Mr. MORIN. During the construction period of several years, although the Government is supplying funds for construction aggregating perhaps \$50,000,000 from the very beginning of construction, Mr. Ford pays a total rental of \$1,200,000 for a 6-year occupancy of Dam No. 2, at the rate of \$200,000 a year, and a total rental of \$480,000 for a 3-year occupancy of Dam No. 3, at the rate of \$160,000 a year, which is, in the case of Dam No. 2, a return of eight-tenths of 1 per cent per annum on \$25,000,000 of Government money for a period of six years, and in the case of Dam No. 3 a return of sixty-four one-hundredths of 1 per cent on \$25,000,000 of Government money for three years, as I figure it. These figures are substantially correct, are they not?

Mr. MAYO. I do not know about the totals. It is plainly stated in the offer as to when the payments commence and the amounts. You could not expect Mr. Ford, I do not think, to pay interest on property until he can occupy it and until it is ready to operate.

Mr. MORIN. Why should Mr. Ford not pay 4 per cent during this period, particularly as his aforesaid payments do not begin until a year after the plants have actually been in operation?

Mr. MAYO. We have to build our factory and develop our processes for whatever we intend to make up before we commence taking power, and it takes a considerable amount of time for that. We have tried to make the estimates so that he commences to pay when he commences to use the power.

Mr. MORIN. Whether he should pay or does not so pay 4 per cent for this period, we have to consider as capital to be supplied by the United States the interest lost on the Government's money for a period of six years in one case and three years in another, do we not?

Mr. MAYO. Yes, sir.

Mr. MORIN. These figures are summarized by the Chief of Engineers under date of January 30, 1922. (P. 2 of Exhibit E.)

Funds required to complete Dam No. 2----- \$25,000,000

Interest during construction, one-half of three years, at 5 per cent-- 1,875,000

Interest for first six years subsequent----- \$7,500,000

Less six payments by Mr. Ford----- 1,200,000

Net deficiency----- 6,300,000

Total accrued interest before full payments begin----- 8,175,000

Funds required to complete Dam No. 3----- 25,000,000

Interest during construction, one-half of three years, at 5 per cent-- 1,875,000

Interest for first three years subsequent----- \$3,750,000

Less three payments of \$160,000 by Mr. Ford----- 480,000

Net deficiency----- 3,270,000

Total accrued interest before full payments begin----- 5,145,000

Loss to Government during above periods----- 13,320,000

Is this not true?

Mr. MAYO. We can not reconcile those figures. We will, however, make up our figures as we have figured it, for the record.

Government balance sheet of Muscle Shoals during construction and for first 111 year under Ford proposal.

Assume: Dam No. 2 completed in two years, or one year after first 100,000 horsepower is installed; Dam No. 3 completed in three years, or one year after first 80,000 horsepower is installed; cost of Dam No. 2, \$23,230,000; cost of Dam No. 3, \$19,000,000.

Progress of work.	Years from start of work.	Years of Mr. Ford's lease of Dam No. 2.	Ford payments.		Government interest.		Remarks.
			Account Dam No. 2.	Account Dam No. 3.	Account Dam No. 2.	Account Dam No. 3.	
Work starts on both dams.	0	-----	0	0	0	0	Government does not pay interest in advance. Lease of Dam No. 2 begins. Lease of Dam No. 3 begins.
100,000 horsepower ready at Dam No. 2.	1	0	0	0	\$464,600	\$240,000	
Dam No. 2 completed; 80,000 horsepower ready at Dam No. 3.	2	1	\$200,000	0	\$229,200	\$480,000	
Dam No. 3 completed.	3	2	200,000	\$160,000	\$229,200	\$760,000	
	4	3	200,000	160,000	\$229,200	760,000	
	5	4	200,000	160,000	\$229,200	760,000	
	6	5	200,000	760,000	\$229,200	760,000	
	7	6	200,000	760,000	\$229,200	760,000	
Total.....		-----	1,200,000	2,000,000	6,039,800	4,520,000	
Grand total.....		-----	3,200,000		10,559,800		
Difference.....		-----	7,359,800				Deficit in interest payments.

¹ Interest during construction.

NOTE.—This is \$5,960,200 less deficiency in interest during this preliminary period than is stated by the Chief of Engineers in his report of Jan. 30, 1922. His estimate of this deficiency is \$13,320,000. This deficiency in interest is much more than offset by Mr. Ford's single item of maintenance of nitrate plant No. 2 on which the Ordnance Department figures 5 per cent annual depreciation amounting in the 6 years to \$14,100,000 on a plant valuation of only \$47,000,000.

Mr. MORIN. Considering now the money required to be invested by the Government for flowage rights, rights of way, land for railway and terminal connections—estimated at \$2,000,000 by the Army engineers—is it your judgment that this sum is adequate? May it not, in fact, run several times that sum?

Mr. MAYO. No.

Mr. MORIN. Mr. Ford's offer contemplates a free and unencumbered title to all the property to be transferred to him, so that he contemplates paying no interest on any sums required to acquire said clear title, whether by costly condemnation proceedings or otherwise; is this correctly stated?

Mr. MAYO. No, sir; the Government has to do that anyway to clear its own title.

Mr. MORIN. This clearing up of title may require several million dollars, may it not?

Mr. MAYO. I should think not.

Mr. MORIN. Assuming that this item is, say \$5,000,000, it appears that the following sums will be necessary to carry out the Ford offer:

For Dams Nos. 2 and 3, \$50,000,000; for flowage rights, rights of way, and terminals, \$2,000,000; for clearing title, \$5,000,000; for interest charges lost, \$13,320,000; a total of \$70,320,000. If these totals are correct, and they seem to me to be, the minimum sum required we find as capital required an amount aggregating \$70,320,000, on only \$50,000,000 of which Mr. Ford pays interest. This leaves a sum exceeding \$20,000,000 on which the United States must continue to pay interest, if at 5 per cent, as calculated by the Chief of Engineers, of over \$1,000,000 annually for the term of the lease; is that correct?

Mr. MAYO. No, sir. The question is too long to give a definite answer to, but all the figures are greatly in excess of what they should be.

Mr. MORIN. These figures are susceptible to your analysis as an engineer and it would be of advantage to the record if you will point out any discrepancies.

Mr. MAYO. All right, sir.

Mr. MORIN. And will you put them in the record?

Mr. MAYO. Yes, sir.

Analysis of Mr. Morin's statement of noninterest-bearing charges on Dam No. 2.

Item.	Mr. Morin's estimate.	Mr. Ford's engineers' estimate.	Remarks.
Cost of completing Dam No. 2 and building Dam No. 3.	\$50,000,000	\$42,230,000	Discrepancy largely accounted for by economies possible with private rather than Government construction. Unit prices lower account decreased market prices.
Flowage rights, rights of way, and terminals.	2,000,000	1,650,000	No disposition to hold reservoir lands for high prices is evident locally. Nearly all rights of way and terminals have been acquired.
For clearing title.....	5,000,000	500,000	There would be 1,067 acres for a 100 foot right of way 88 miles long; at \$100 per acre (for rough hilly ground) it would cost \$106,700. This is the principal part of this item of cost.
Interest charges lost.....	13,320,000	7,350,800	See detailed statement above.
Total.....	70,320,000	51,739,800	
Amount on which Mr. Ford does not pay interest.	20,320,000	9,509,800	No analysis of the Ford offer is fair or complete which omits his obligations regarding the nitrate plant. The single item of depreciation on this plant, taken at a normal peace-time value of \$60,000,000, amounts to \$2,500,000 annually and will much more than offset Mr. Morin's items taken at his own figures.
Interest on same at 4 per cent.....	812,800	380,392	
Against which there is an offset because of the fact that Mr. Ford carries the depreciation on nitrate plant No. 2 amounting annually to—	2,500,000	2,500,000	

Mr. MORIN. What is your estimate of the total new money that must be spent by the Government to carry out the Ford offer?

Mr. MAYO. I am of the opinion it will not exceed \$45,000,000.

Mr. MORIN. Mr. Ford's proposal covers a \$35,000 yearly payment for maintenance of Dam No. 2 and a \$20,000 yearly payment for maintenance of Dam No. 3. Is it your opinion as an engineer that these sums are adequate in view of maintaining intact and in first-class condition masonry structures, gates, and hydraulic equipment costing some \$30,000,000 or more?

Mr. MAYO. I think so.

Mr. MORIN. These amounts are less than two-tenths of 1 per cent of such cost. Is it not customary of work of such character and hazard to figure bare maintenance cost at a much higher figure, say 1 per cent or more?

Mr. MAYO. I think not. The amount does not include the upkeep on the power plant which is taken care of by Mr. Ford.

Mr. MORIN. Would even 1 per cent be a safe figure when the risk of flood damage and responsibility for life and property is considered, this responsibility being entirely carried by the Government?

Mr. MAYO. We have figured the amount we could afford to pay for maintenance based on what we figure we can pay for the cost of the power, and that allows us to allot that much for the maintenance.

Mr. MORIN. This responsibility for and maintenance of dams of this magnitude and character on a stream of the type of the Tennessee where severe flood conditions frequently occur, is a real hazard which engineering skill in design and construction can not completely remove, is it not?

Mr. MAYO. Yes, sir.

Mr. MORIN. There have been, to your knowledge, many expensive and disastrous failures of such structures, have there not?

Mr. MAYO. Yes, sir.

Mr. MORIN. What if the dams should fail in whole or in part, or foundations prove defective, would it be the task of the United States under this offer to rebuild the structure or remedy the defects?

Mr. MAYO. Yes, sir.

Mr. MORIN. It would be?

Mr. MAYO. Yes, sir.

Mr. MORIN. And on this further new money would Mr. Ford pay interest?

Mr. MAYO. That has not been contemplated.

Mr. MORIN. Is it possible for these failures to occur?

Mr. MAYO. Almost anything is possible.

Mr. MORIN. Then it is possible. And that such failures might involve large sums of new money running into the millions?

Mr. MAYO. It might.

Mr. MORIN. And under the Ford offer these risks are entirely borne by the United States?

Mr. MAYO. Yes, sir.

Mr. MORIN. The fixation of atmospheric nitrogen is a new art, is it not?

Mr. MAYO. Quite new, relatively so.

Mr. MORIN. What nitrogen fixing plants are there in operation in the United States?

Mr. MAYO. The one at Syracuse, N. Y.

Mr. MORIN. Is that the only one?

Mr. MAYO. I think so.

Mr. MORIN. What plants are there abroad that you know of?

Mr. MAYO. I will put that statement in the record. I have not a list of them all.

World capacity of air nitrogen plants.

[Metric tons of nitrogen (2,204 pounds per ton).]

	Haber.	Cyan- amid.	Arc.	Total.
Germany.....	300,000	93,000	393,000
France.....	40,000	1,000	41,000
Italy.....	12,000	1,000	13,000
Scandinavia.....	28,000	30,000	58,000
Austria.....	22,000	22,000
Switzerland.....	7,500	7,500
Japan.....	12,000	12,000
Canada.....	12,000	12,000
United States.....	(1)	40,000	40,000
Total.....	300,000	266,500	32,000	598,500

¹ There should be added about 3,000 tons to cover the probable output of the modified Haber process plant recently installed at Syracuse, N. Y. Nitrate plant No. 1 at Muscle Shoals was designed for this process, but being unworkable without extensive rebuilding, is omitted.

Mr. MORIN. I wish you would. What are the several processes so far developed?

CONVERSION OF ATMOSPHERIC NITROGEN.¹

The conversion of the nitrogen of the air into compounds available for use may be accomplished in several ways, the principal ones of which are:—

1. The direct oxidation of nitrogen and its conversion into nitric acid.
2. The combination of nitrogen with metals to form nitrides, which may be treated to furnish ammonia.
3. The formation of cyanides or cyanogen compounds by combination of nitrogen with metals and carbon.
4. The formation of a compound with carbide, producing cyanamid.
5. The direct combination of nitrogen and hydrogen from its elements for the formation of ammonia.

THE ARC PROCESS.

The direct oxidation of nitrogen in the electric arc to form nitric acid was the first of the processes to be developed abroad. Many forms of arcs, through which air passes or is blown, have been proposed, but the principle involved is the same, the union of oxygen and nitrogen at the temperature of the arc. The only commercially successful plant is located in Norway, where electric power is cheap. The method itself is very inefficient as regards production in relation to power consumed. The low cost of electric power in Norway makes the process workable there.

It is generally conceded that this process would not be adapted, in its present state of development, for use in the United States. Apparently there is not a sufficiently large amount of cheap hydroelectric power available in America within reach of points where nitric acid would be used. The cost of installing the process is high, and the product, nitric acid, is not economically transportable. Nitric acid is not readily converted into materials that are used for fertilizers. Calcium nitrate and ammonium nitrate formed by neutralizing nitric acid with lime or ammonia are of some value as fertilizer material, but can not be used readily in mixed fertilizers demanded by American farmers. In spite of the simplicity of the arc process, and the supply of raw material without cost, the disadvantages are seemingly greater than the advantages for this country.

NITRIDE PROCESS.

The nitride process consists of the combination of nitrogen with various materials under the influence of high heat, and the nitrides produced may be treated subsequently to furnish ammonia. The best developed of the nitride process is that of making aluminum nitride from alumina, coke, and nitrogen heated to a temperature of about 1,800 ° C. in an electric furnace. The process has not been developed sufficiently to show what the ultimate power requirements would be, although they are known to be rather high. At present, however, it is not used on a commercial scale for the production of ammonia.

CYANIDE PROCESS.

The cyanide process is one depending upon the formation of cyanides by the combination of nitrogen with metals and carbon. There is no difficulty in the chemical reaction involved. Sodium carbonate, ground coke, or carbon in some other form is brought into contact with finely divided iron and heated to redness, and nitrogen or air passed through the mass. The nitrogen is fixed as sodium cyanide. The reactions take place readily, but mechanical difficulties of carrying them out have not as yet been entirely solved. The sodium cyanide formed may be readily converted into ammonia, and the sodium carbonate recovered for further use. The product obtained here, as in the case of the nitride process, is ammonia. This process, however, at present is not a commercial success.

¹ An extract from a paper entitled "Atmospheric nitrogen for fertilizers," by R. O. E. Davis, scientist, U. S. Bureau of Soils.

CYANAMID PROCESS.

The cyanamid process consists of the union of nitrogen with carbide at the temperature of the electric furnace. Raw materials required in the process are lime, anthracite coal, or coke for producing calcium carbide and nitrogen obtained from liquid air. The process consists of the production of the carbide in a large furnace by heating lime and coke or anthracite coal. The second step involves the fine grinding of the calcium carbide without contact with air and heating the ground mass to a red heat, when nitrogen is introduced and is absorbed by the carbide to form cyanamid. The cyanamid may be treated with steam for the production of ammonia. This is necessary where nitric acid or nitrates are to be formed, but cyanamid itself has a value as a fertilizer material. This process has been worked commercially in Germany, producing about one-third of the German requirements during the recent war. It has also been worked successfully in other countries, and the only commercial plant for fixation of nitrogen on the American Continent used this process. This plant at Niagara Falls has been in operation for a number of years, producing cyanamid chiefly for agricultural purposes. The advantage of this process is that it gives a product which is saleable as a fertilizer material or convertible into materials which may be used for fertilizers. The disadvantages are that it involves a high consumption of power and the cost of the finished product is comparatively high.¹ In addition the product is very disagreeable to handle because of the irritation to the mucous membranes when the dust is breathed by animals or men working with it.

HALER PROCESS.

The Haler process is based upon the direct combination of nitrogen and hydrogen in the elemental form to produce ammonia. The process has to be carried out at a pressure of 160 to 260 atmospheres and a comparatively high temperature, about 550° Centigrade. The process was first developed in Germany, and during the recent war it contributed at least one-third of the fixed nitrogen required by that country. In no other country has this process been worked commercially,² but a great deal of work has been done toward developing it. It has a number of advantages. The power required is small, the product—liquid ammonia—is readily available for oxidation, and the nitric acid obtained is convertible into fertilizer materials. The raw materials—air, water, and coal—are available in large quantities. The disadvantages of the method involve the use of highly technical labor and the mechanical difficulties of carrying out the operations at pressures of 160 or more atmospheres.

Mr. MAYO. I will put that in the record also.

Mr. MORIN. What study have you made of processes for such fixation as applicable to nitrate plant No. 2?

Mr. MAYO. We have made quite a number of studies.

Mr. MORIN. Have they been satisfactory?

Mr. MAYO. Quite so.

Mr. MORIN. Many people and scientists who are working on this very problem are of the opinion that Plant No. 2 can not produce nitrogenous compounds at a price at which they can compete with similar compounds from other sources or made by other processes; what is your opinion?

Mr. MAYO. I will refer to two statements made by eminent authorities, one by Dr. N. Caro and one by Mr. Frank Washburn, president of the American Cyanamid Co. Dr. Caro is the originator of this cyanamid process.

The CHAIRMAN. He is in Germany, is he not?

Mr. MAYO. Yes, sir. We will submit these two authorities, Dr. Caro and Mr. Washburn.

(The statements referred to follow:)

“Dr. N. CARO. How far the German nitrogen industry will be able to cope with foreign competition, in view of high wages and high costs of combustibles, can not at present be predicted. Since the cost of coal, which in the future is sure to be one of the most important items of expense, can hardly decrease, the

¹ The cost depends to a large extent upon the cost of power. (W. B. M.)

² Since the war a small plant using a modification of the Haler process has been operated at Syracuse, N. Y. A large plant employing this process recently blew up at Oppau, Germany, with great loss of life. (W. B. M.)

lime-nitrogen industry, on account of its unusually small consumption of coke, will be in a very favorable situation. This will be particularly true when the construction market sinks to some halfway normal level, so that the capital cost of water-power developments will be more reasonable. * * *

"Far more dangerous (than the competition of Chilean nitrate) appears to be the possibility of competition with artificially fixed nitrogenous fertilizers produced in foreign countries.

"The largest of these (foreign lime nitrogen) plants is located in the United States, in Alabama. Its situation is most excellent.

"It is connected with the ocean by means of the Tennessee River, which has been made navigable. It is situated at a source of almost constant water power, amounting to 400,000 horsepower, and is right in the midst of a locality where all the raw materials of the lime-nitrogen (cyanamid) industry are present in the highest purity and at the very lowest prices. * * *

"Near by are the inexhaustible deposits of high per cent phosphate rock. The possibility therefore exists of * * * producing cheaply * * * ammonium phosphate containing roughly 45 per cent of water-soluble phosphoric acid and 20 per cent nitrogen."

"Mr. WASHBURN. My anticipation is that the establishment of the nitrogen industry, as it can be established with what I believe and what I believe would appeal to those who study the subject is the proper and legitimate Government cooperation, will give the farmer his fertilizer for one-half of what he would otherwise pay for it."

The CHAIRMAN. Where can Dr. Caro be reached at this time?

Mr. MAYO. I could not say. I expect in Germany.

The CHAIRMAN. He was identified, I recall, with a German company.

Mr. MAYO. Yes, sir.

The CHAIRMAN. I think he was at the head of those companies.

Mr. MAYO. I believe so.

The CHAIRMAN. We would have to go over to Germany to get him.

Mr. MORAN. From your study and knowledge, is Mr. Ford able to so operate plant No. 2 for the agreed period of 100 years that his produce—ammonium nitrate or other fertilizer compounds—can successfully compete with these other sources?

Mr. MAYO. I am of the opinion he can.

Mr. MORIN. Ammonium nitrate is, as I understand it, only one of the ingredients necessary to the making of a complete fertilizer such as agriculture can use; is this understanding correct?

Mr. MAYO. Yes, sir.

Mr. MORIN. In the form produced at nitrate plant No. 2 it is not fertilizer, but is a fertilizer compound; is not that true?

Mr. MAYO. He intends to produce a complete fertilizer.

Mr. MORIN. He intends to produce a complete fertilizer?

Mr. MAYO. Yes, sir.

Mr. MORIN. Would it be sold in this form to the farmer?

Mr. MAYO. Yes, sir.

Mr. MORIN. Could the farmer use it in this form without the addition of the other essential ingredients?

Mr. MAYO. He will be able to use the completed product as it will be furnished from that plant.

Mr. MORIN. As it will be furnished to him?

Mr. MAYO. Yes, sir.

Mr. MORIN. It will not be necessary, then, for the farmer to mix it with the other ingredients in order to market this product through the fertilizer mixers now existing?

Mr. MAYO. Not further than perhaps mixing it with dry earth or sand or something he has right at hand.

Mr. MORIN. If Mr. Ford plans the making of a complete fertilizer, does Mr. Ford's 8 per cent profit mean that the farmer will get his complete fertilizer at 8 per cent above cost?

Mr. MAYO. Yes, sir.

Mr. MORIN. And his 8 per cent is not limited to the ingredients of ammonium nitrate?

Mr. MAYO. It is limited to everything that goes into the cost of production.

Mr. MORIN. Complete.

Mr. MAYO. Yes, sir.

Mr. MORIN. If found by Mr. Ford after the starting of operations that he can not produce ammonium nitrate in competition with the wholesale market price of the same material from other sources, do you understand that his agreement binds him to continue the operation of the plant for nitrogen compounds at a loss?

Mr. MAYO. I do not think so, but of course he would have an opportunity to change the process. He would exhaust every effort with every process before he would quit.

Mr. MORIN. But it would not bind him to continue?

Mr. MAYO. I hardly think so. However, I would consider he was bound to keep the plant there in readiness.

Mr. MORIN. He has stated to Secretary Weeks that he would not run the plant at a loss.

Mr. MAYO. I think he meant he could not.

Mr. GREENE. I do not know whether the last question brought out just exactly what I want to know or not. If this contract holds for 100 years, of course, it is reasonable to expect that constant experimentation and research work will develop, very likely, new discoveries in chemistry and chemical combinations used in fertilizer.

Mr. MAYO. Yes, sir.

Mr. GREENE. And they will bring with them, of course, new processes, mechanical and otherwise, so that there is always the possibility that the present idea of fixation of nitrates will be superseded.

Mr. MAYO. Yes, sir.

Mr. GREENE. And that this particular plant with its present equipment may be a side issue within a quarter of a century.

Mr. MAYO. Yes, sir.

Mr. GREENE. Does the contract proposed by Mr. Ford contemplate his following all these new experimentations and developments in the chemistry of fertilizers, so that he may continuously keep abreast of what is being done in the world?

Mr. MAYO. Yes, sir.

Mr. GREENE. And he obligates himself to do that?

Mr. MAYO. I would say so.

Mr. GREENE. If the method and practice presently followed or if other processes or agencies or conditions or influences intervene to sidetrack the present methods or some later method, he will still develop fertilizer for the farmers there.

Mr. MAYO. That is his intention.

Mr. GREENE. If it is possible that the fixation of nitrates—because I suppose the chemistry of the soil will not change no matter what man does about his agencies—if the development of the fixation of nitrates goes to such a point that it becomes a more or less everyday neighborhood affair, commercially, with no longer any particular incentive for the Government or a great industry to concentrate on it, so that the present objective of this proposition was lost, would Mr. Ford still continue to manufacture fertilizers there?

Mr. MAYO. Not unless it could be done profitably. I think after he had evidenced he had exhausted every effort known to the state of the art to produce it at a profit, if it was not in the woods, so to speak, I do not think he would be obligated to continue.

Mr. GREENE. Somebody outside may be producing it at a profit.

Mr. MAYO. If they could there is every reason to believe that he could.

Mr. GREENE. Exactly; but the question was raised several times as to whether those conditions not within his control and so on, which are his outlets from the fulfillment of this nitrate part of the contract, would include such a thing as outside competition; in other words, if he should be bested by outside competition and in a state where he could not produce as economically as other people in the business could, would that be his legitimate and altogether valid reason for discontinuing?

Mr. MAYO. The only valid reason for discontinuing would be that he had proved by every possible effort that it was an absolute impossibility to make the product there with a profit.

Mr. GREENE. That would have to be both a physical and a moral proposition.

Mr. MAYO. Yes, sir.

Mr. GREENE. And yet, of course, the inducement in this contract, as it has been put by some of our brethren, is that Mr. Ford will produce fertilizer there

so cheaply that the outside world will not raise the price of it. If that condition to this contract fails, what inducement is there for the Government to do it in behalf of the people. Mr. Ford is left with no obligation to continue the fertilizer part of the contract and has got a very generous water power on hand to sell.

Mr. MAYO. He is paying the lease price for it. It is reasonable to suppose that after starting in the production of fertilizer for any length of time, he would not discontinue unless he had exhausted every effort.

Mr. GREENE. My questions are not meant to prove any anticipated thoughts on my own part at all.

Mr. MAYO. I understand.

Mr. GREENE. I am just trying to see how nearly our minds meet. I am assuming that Mr. Ford will be governed throughout as a reasonable man, and that all we can expect of him is to do as reasonable men would do. This is not necessarily an antagonistic question, but the question does come, after all: If the inducement, the one which is so much urged upon us, is the certainty that the farmer will have through this means a source of supply of fertilizer that will maintain by competition a stable market price that is reasonable, if Mr. Ford at any time sees the necessity for abandoning such a competitive interest in fertilizers, then, of course, the market goes against the farmer if the people on the outside can bring that about.

Mr. MAYO. I do not see how there is any chance for him to continue to carry out the moral obligation of the contract and discontinue. He is entering into this in good faith.

Mr. GREENE. I have no doubt of it.

Mr. MAYO. And he will not quit, because there is more or less of hardship in trying to meet competition. The only reason for him to discontinue would be his actual inability to manufacture at a profit.

Mr. GREENE. Yes; and that is the very phase, you know, that proves the stumblingblock, as to what would be a legitimate excuse for his inability, the physical conditions attending the plant, or failure to bring those physical conditions up to a point where they met outside competition.

Mr. MAYO. Every authority that knows anything about that particular business agrees and are a unit in the opinion that that plant is as favorably situated as any plant in the world to make fertilizers cheaply. Now, if that is a fact, it goes without saying that he will have the fundamental possibilities of making it cheaper than anybody else.

Mr. GREENE. Then, just to clear that, if you please, that is reckoned upon the present process.

Mr. MAYO. Yes, sir.

Mr. GREENE. Now, supposing, as I said, we develop new processes, it is expected he will follow those developments, too, and institute in his plant the changes that are necessary in order to follow them?

Mr. MAYO. Yes, sir.

Mr. GREENE. One more question, if you please: This 8 per cent profit which Mr. Ford limits himself to in the terms of his proposed contract is supposed to be 8 per cent profit on the price as laid down to the individual farmer?

Mr. MAYO. It does not matter, it seems to me, where you take it; whether it is at the door of the factory or to the farmer, it is 8 per cent on whatever the cost may be.

Mr. GREENE. Yes; and I only asked that because I thought, perhaps, that was not businesslike form, and it was brought out here once or twice, I believe, through previous witnesses, that possibly Mr. Ford might keep within the letter of this contract if he sold immediately his product to some middleman at 8 per cent; would that be within the terms of the spirit of the contract?

Mr. MAYO. I think not. His intention is to deliver it as near directly to the consumer as possible.

Mr. HULL. Mr. Mayo, following Mr. Greene's questions on the 8 per cent matter, is that 8 per cent on the turnover or 8 per cent on the money invested?

Mr. MAYO. Eight per cent on the cost of the annual production.

Mr. HULL. It would not be on the turnover, because that would really be a cost-plus scheme.

Mr. MAYO. On the annual production cost is the way we put it.

Mr. HULL. Now, Mr. Mayo, speaking of contract No. 2, it is apparent, I think, to us all what is intended in that contract. As I understand, you do not care to make any radical changes in that contract. However, I presume you would not object to making the contract more specific if we thought it was

advisable in order to protect the interests of the Government and the people; anything that would clear it up would be acceptable, would it not?

Mr. MAYO. I imagine, if we have not clearly stated our intent, the wording may be changed to clarify it.

Mr. HULL. Any reasonable changes in order to make it clearer.

Mr. MAYO. Yes.

Mr. HULL. There are some things in there which I think naturally would suggest themselves to anyone. I do not care to go into all the details because it would take quite a good deal of time.

Mr. MAYO. Mr. Ford has indicated he did not want to make any further changes, but if there is some change in the wording to clarify the meaning, he would accept it.

Mr. HULL. You estimate about \$45,000,000 would be about the approximate sum the Government would have to invest in the proposition to make it a going concern for Mr. Ford. In that do you estimate the increased cost of the flowage rights there. I imagine, although I may be wrong, that there will be increased costs of the flowage rights the minute you begin buying them up. Have you thought of that?

Mr. MAYO. I did not quite get you.

Mr. HULL. Have you thought of the increased cost of the flowage rights when you go to buying them up. The minute the Government goes to buying anything of that kind up we found through our experience during the war that immediately the real estate we want increases in value very materially, without any reason at all except that it is the Government that is buying it.

Mr. MAYO. They did not find that so when they bought the flowage rights for Dam No. 2, did they?

Mr. HULL. If they did not, it was about the only case I know of during the war.

Mr. MAYO. My understanding is those lands were bought at a figure approximating the estimates.

Mr. HULL. They were.

NOTE.—The estimated cost of the lands and flowage rights at Dam No. 2 was \$850,000 in 1916. (H. Doc. 1262, 64th Cong., 1st sess., p. 35.) The actual cost of acquiring 6,612.4 acres out of 7,212.4 acres has been \$383,490 (averaging \$58 per acre) and the War Department's estimate of the cost of acquiring the remaining 600 acres is \$40,000, making a total amount for this item at Dam No. 2 of \$423,490. (From record of Chief of Engineers: U. S. Engineer Office, Florence, Ala., statement of July 31, 1921.)

Mr. MAYO. Yes. I am led to believe we can buy those rights within the estimate we have suggested.

Mr. HULL. You know who the owners are?

Mr. MAYO. Many of them; yes, sir.

Mr. HULL. Of course, there is a great deal of emphasis placed by the public and the press and some of the committee on the fertilizer proposition, and that is very valuable, but to my own mind this contract is far more valuable to the Government in the fact that if we accept it we will always have an independent source of ammonium nitrate.

Mr. MAYO. Yes, sir.

Mr. HULL. Without the changing of the plant or anything of that sort, that supply would always be protected, would it not?

Mr. MAYO. Yes, sir.

Mr. HULL. There can be no doubt about that.

Mr. MAYO. No, sir.

Mr. HULL. You would not have the right, although, apparently, under the contract you have bought this property—although I might say that I believe you have simply bought the land of it because you would not have the absolute right of ownership there because you could not change that plant and destroy what we now have in plant No. 2, and that is, an independent source for the production of ammonium nitrate.

Mr. MAYO. Not unless we replaced it with something equally as good or better.

Mr. HULL. I do not know that I want to correct an expert and perhaps I may be wrong, and if I am I was misinformed, but you said ammonium nitrate was the ingredient that went into fertilizer; is it not ammonium sulphate?

Mr. MAYO. Ammonium nitrate can be used. It is not usually used in that form.

Mr. HULL. It is not a success as a fertilizer?

Mr. MAYO. I would not say it could not be, but it is not now.

Mr. HULL. It may be that you may find some way of doing that. As a matter of fact, right on that point, this plant produces to-day ammonium nitrate.

Mr. MAYO. Yes, sir.

Mr. HULL. To produce ammonium sulphate, which you will have to produce, I think, if I am correctly informed, you would have to spend about one million, or two, or three million dollars; is not that true?

Mr. MAYO. We might, if we went into ammonium sulphate.

Mr. HULL. Of course, that money you spend yourself?

Mr. MAYO. Yes, sir.

Mr. HULL. That is a part of your proposition, and you would keep the plant, at all times, so that in case we needed it at any time for war purposes we could convert it right back into an ammonium nitrate plant.

Mr. MAYO. Yes, sir; or perhaps if the need of the Government changed it might be changed to make some substitute.

Mr. HULL. We understand that, and that would be all right.

Mr. MAYO. To all intents and purposes it would be kept ready for them as the contract states.

Mr. HULL. Of course, you will turn over your personnel and all that.

Mr. MAYO. Certainly.

Mr. HULL. Like Mr. McKenzie, I am a little in doubt as to the purchase of this Gorgas plant, and I can not see just exactly why that is necessary, and I imagine it is going to be a very hard nut for the committee to crack. As I understand it, you say you want it to duplicate the power by steam. That power is practically duplicated in plant No. 2 and the Gorgas plant is some 70 or 80 miles away, and would not be necessary to the proposition, so far as I can see.

Mr. MAYO. It is more beneficial, as we look at it, than the one located at plant No. 2.

Mr. HULL. It is?

Mr. MAYO. Because it is at the coal mines, really, and it does not necessitate transportation of the coal.

Mr. HULL. There is a new element then. It is so near the coal mines that therefore you think it would be much cheaper?

Mr. MAYO. Yes, sir; you can make your power cheaper and it increases our primary power that much.

Mr. HULL. In your 8 per cent profit on what you sell the farmer—and you say you are going to sell it direct to the farmer and not to any middleman or corporation to profiteer on the farmer; is not that true?

Mr. MAYO. The hope is to hand it to the farm organizations and let them distribute it themselves.

Mr. HULL. Now, how about the salaries of these men engaged in that work; that would have to be figured in?

Mr. MAYO. Certainly.

Mr. HULL. Is there any protection against excessive salaries?

Mr. MAYO. Nothing but good faith, I guess.

Mr. HULL. Would it not be a pretty good plan to suggest some salary list there?

Mr. MAYO. I think not.

Mr. HULL. You could put in men at \$50,000 and the farmers would have to pay those salaries.

Mr. MAYO. That is very true, but I do not think we would stand very well with the farmers if we started that sort of tactics.

Mr. HULL. I understand that, Mr. Mayo, and I would not have the slightest doubt if this contract was to be carried out by the present personnel of the Ford company; but that is not the proposition. You realize we are making a contract for 100 years, and at the least it will be three years before you start and probably from 15 to 18 years, as you suggest, and in that time many things may change, and it might be over in the hands of a corporation, and our dealings with corporations are not such as to be as satisfactory sometimes as when we are dealing with persons.

Mr. MAYO. We hope to start within a year.

Mr. HULL. Producing fertilizer?

Mr. MAYO. Yea, sir.

Mr. HULL. I am glad to hear that. I did not know you figured you could do that. You would have to start, then, with your steam power.

Mr. MAYO. Yes, sir.

Mr. HULL. You hope to start right away with steam power manufacturing the fertilizer and selling it to the farmer?

Mr. MAYO. Yes, sir.

Mr. HULL. What do you estimate the cost of ammonium sulphate from this plant would be at the present time under present conditions?

Mr. MAYO. We have not attempted to find out what the cost would be under present conditions.

Mr. HULL. You have not?

Mr. MAYO. No, sir; we have several processes that we have been at work on for the last six months, and we still do not know which one we will finally adopt.

Mr. HULL. Under this contract you also take plant No. 1.

Mr. MAYO. Yes, sir.

Mr. HULL. What do you intend to do with that?

Mr. MAYO. Use it for manufacturing purposes.

Mr. HULL. For manufacturing fertilizer?

Mr. MAYO. No, sir.

Mr. HULL. For manufacturing nitrates?

Mr. MAYO. No, sir; manufacturing parts for our automobile business.

Mr. HULL. You intend to manufacture parts for the automobile over there?

Mr. MAYO. Yes, sir; raw materials.

Mr. HULL. That would, of course, contemplate changing that plant entirely from a nitrate plant.

Mr. MAYO. Yes, sir.

Mr. HULL. You do not contemplate, however, changing No. 2 in that way.

Mr. MAYO. No, sir.

Mr. HULL. You have not any doubt but what you can manufacture a cheap fertilizer at plant No. 2 at the present time?

Mr. MAYO. We have no doubt at all; no, sir.

Mr. HULL. How is the Government to be protected against destruction by fire or by an explosion of plant No. 2? You would expect to insure against that?

Mr. MAYO. Yes, sir.

Mr. HULL. Who would have to pay for that insurance?

Mr. MAYO. Mr. Ford would.

Mr. HULL. That would be charged against the operation and against the project?

Mr. MAYO. Yes, sir.

Mr. JAMES. Mr. Mayo, the last proposition of Mr. Ford was drawn in the office of the Judge Advocate General of the War Department, was it not?

Mr. MAYO. Yes, sir.

Mr. JAMES. Were you present?

Mr. MAYO. Yes, sir.

Mr. JAMES. When the Judge Advocate General was before the committee the other day the matter concerning the cost of the flowage rights came up, and he stated that Mr. Ford believed the Government could acquire those cheaper than anybody else, and there was not any doubt in his mind but that Mr. Ford intended to reimburse the Government for those expenditures, and that when you appeared before the committee you would agree with his view concerning that matter. What have you to say about that?

Mr. MAYO. I differ from his opinion; I do not think Mr. Ford intends to have that charged up against the project at all.

Mr. JAMES. It makes quite a difference to the Government whether it has to pay for them or whether Mr. Ford is going to pay for them.

Mr. MAYO. I have stated before that Mr. Ford thought that the cost of those flowage rights should be charged up to navigation.

Mr. JAMES. What plan has Mr. Ford for giving the fertilizer to the farmer?

Mr. MAYO. No definite plan has been worked out.

Mr. JAMES. You think he intends to work it out through some agricultural society?

Mr. MAYO. That is the intention; yes, sir.

Mr. JAMES. If that plan fails through, and he has to sell to others to distribute, and they in turn distribute to the retailers, would that 8 per cent profit include all the different turnovers, or would Mr. Ford's profit be 8 per cent, and the distributors and the retailers get a percentage?

Mr. MAYO. If it passes out of his hands before it reaches the consumer he would do everything he could to hold the price within reasonable limits. The

object has always been, however, to get the fertilizer delivered direct to the farmer without passing through the hands of third parties.

Mr. JAMES. How much capital do you think would be sufficient—that is, the lowest amount Mr. Ford would have to put into the company to buy that property from the Government and to carry out the different propositions he intends to carry on?

Mr. MAYO. My impression is that within a few years he will probably invest twenty-five or thirty million dollars.

Mr. KEARNS. Following the line of questions that Mr. Hull asked you, the last question he asked you was in reference to the matter as to whether Mr. Ford would pay the cost of insurance against fire and explosions. Under this contract you say he agrees to pay all the expenses of the upkeep of the machinery and plant. As I remember it, there was nothing stated about that in the contract. Does Mr. Ford agree to pay all the expense of the upkeep of the machinery and plant?

Mr. MAYO. According to the contract, the property is sold to Mr. Ford, and it is up to him to keep it intact, in working order at all times.

Mr. KEARNS. It is leased to him, and not sold to him; is it not?

Mr. MAYO. Oh, no; it is sold.

Mr. KEARNS. Do you know how much nitrate is used in the manufacture of fertilizer in the United States to-day?

Mr. MAYO. Somewhere around 200,000 tons of nitrogen.

Mr. KEARNS. Then Mr. Ford agrees to manufacture 110,000 tons—that is, to manufacture more than half of what is used in the United States?

Mr. MAYO. No, sir; there are 200,000 tons of nitrogen used.

Mr. KEARNS. He agrees to produce 110,000 tons of ammonium nitrate. How much of that is used in the fertilizer which is used in the United States to-day?

Mr. MAYO. I do not know of any ammonium nitrates used in fertilizers now.

Mr. KEARNS. What do you mean in the contract when you say you will run to the full capacity, and that the capacity now is equal to 110,000 tons of ammonium nitrate per annum?

Mr. MAYO. Run it at a capacity the equivalent of 110,000 tons of ammonium nitrate.

Mr. KEARNS. That is used in the manufacture of fertilizers, is it not?

Mr. MAYO. They have not up to date used ammonium nitrates in fertilizers.

Mr. KEARNS. Do they not convert it into some other product?

Mr. MAYO. They can make it into sulphate of ammonia. So far as the capacity of the plant is concerned, it was built to make ammonium nitrate, so that the capacity at which we agreed to run it is the capacity stated, as 110,000 tons annually.

Mr. KEARNS. I think you have stated you intend to manufacture the finished fertilizer, the finished product?

Mr. MAYO. Yes, sir.

Mr. KEARNS. Ready for the farmer to use on his crops?

Mr. MAYO. Yes, sir.

Mr. KEARNS. What percentage of the fertilizer used in the United States would you propose to manufacture?

Mr. MAYO. That is difficult to say, but I imagine it will be about 20 per cent.

Mr. KEARNS. Would the production of the 20 per cent of the fertilizer produced in the United States enable you to control the price of the fertilizer?

Mr. MAYO. We would only be able to control what we made ourselves.

Mr. KEARNS. What effect would that have on the other 80 per cent?

Mr. MAYO. It would have its influence on the 80 per cent, surely.

Mr. KEARNS. Would Mr. Ford have any objection to clarifying this contract to make it appear clear that he is going to manufacture fertilizer, and not only one of the component parts?

Mr. MAYO. I do not know that he would object.

Mr. MILLER. Mr. Mayo, you are the personal representative of Mr. Henry Ford, are you?

Mr. MAYO. Yes, sir.

Mr. MILLER. As I understand it, it is a principle of law that when there are any ambiguous terms in connection with a contract oral testimony may be received by the court in the interpretation of the ambiguous terms. As I understand it, you are giving your testimony with a view of being so bound?

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, I have before me the offer of Mr. Ford. I anticipate that it is your idea if this proposition is accepted by the Congress of the United

States that then Mr. Ford's personal identity with this enterprise ceases and the company to be organized will continue.

Mr. MAYO. Mr. Ford has not definitely determined whether he will run it individually or as a company—it would be a corporate organization in either case, controlled, under the contract, by Mr. Ford or his estate.

Mr. MILLER. I read this language in the offer, "For the purpose of carrying out the terms of this agreement the undersigned will form a corporation (hereinafter referred to as the company), to be controlled by the undersigned, which company will immediately enter into and execute all necessary or appropriate instruments of contracts to effectuate this agreement." That is in the first paragraph of the agreement. He then binds himself to organize this company, as I understand his offer. Am I right about that?

Mr. MAYO. I think you are right; yes, sir.

Mr. MILLER. Then we lose Mr. Ford's personal identity and we are dealing with the company specified in his offer, or the corporation as he used the word. It says, "the undersigned will form a corporation." He will organize this corporation, and thereafter Mr. Ford's personal identity will be lost, and the United States Government will deal with this corporate body. Now, is it your idea to organize this corporation under the laws of the State of Alabama?

Mr. MAYO. I do not know, sir.

Mr. MILLER. Do you know that in all States of the American Union there is a certain limitation to the life of a corporation?

Mr. MAYO. Yes, sir.

Mr. MILLER. That in some States it is 25 years, in some States 50 years; there are various periods. Say that the life of a corporation in a State where it was organized is 50 years. Let us assume that. At the end of that period your corporate rights will expire by operation of law. That will happen as a matter of law. Then the remainder of your lease will have to be carried out by some corporation not in being at the present time.

Mr. MAYO. I suppose it could be renewed.

Mr. MILLER. I know of no State, I will say by way of information, where there is any provision for the renewal of the life of a corporation. The rights of a corporation expire by operation of law at the end of the limitation. Then a new corporation may be formed to take over the properties and assets and liabilities of the old corporation; but I know of no State in the American Union that provides for the perpetuation of the identical corporate rights. As a matter of fact, Mr. Ford is binding himself for the period of the life of a corporation and a period of 50 years beyond. That is what I understand from this offer.

Mr. MAYO. Apparently, but this agreement also binds the successors or assigns of the company. (See sec. 19.)

Mr. MILLER. That becomes a matter of law, whether that can be legally done. I want to refer to another angle of your contract, or the proposal of Mr. Ford. By the way, I see Mr. Ford has signed this at Dearborn, Mich.

Mr. MAYO. Yes, sir.

Mr. MILLER. He is a citizen of the State of Michigan, I believe.

Mr. MAYO. Yes, sir.

Mr. MILLER. He binds his estate, I notice in the closing clause of this agreement, and at the end of one year after Mr. Ford's death all claims against the estate will have to be audited and presented to his administrator or executor under the laws of the State of Michigan. I believe that is right, is it not?

Mr. MAYO. I imagine so.

Mr. MILLER. So far as any liability of the estate after one year following his death is concerned the estate can not be bound in any way?

Mr. MAYO. I am not prepared to say anything about that.

Mr. MILLER. I was asking if those things were taken into consideration, from the legal aspect of jeopardizing the estate of Mr. Ford. I had supposed they were.

Mr. MAYO. I think so.

Mr. MILLER. I will ask you to take the tender of Mr. Ford, dated at Dearborn, Mich., on the 25th day of January, 1922, and point out the section in there where Mr. Ford agrees to make a commercial fertilizer and place the same on the market and keep it on the market at 8 per cent profit for the next hundred years. As near as I can get at it, that is in section 15.

Mr. MAYO. In section 14, I would say.

Mr. MILLER. Let us analyze that very briefly: "The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds—said capacity being equal to approximately 100,000 tons of ammo-

nium nitrate per annum—throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control. And it further agrees to continue the work of research. He agrees to manufacture ammonium nitrate for 100 years. I am inquiring in what other place in Mr. Ford's tender he agrees to manufacture a commercial fertilizer. He agrees by the provisions of that section to manufacture one of the ingredients of the fertilizer.

Mr. MAYO. He says, "In the production of nitrogen and other fertilizer compounds."

Mr. MILLER. I am wondering if Mr. Ford would have any objection to writing language in there something like this, "In order that a commercial fertilizer may be produced throughout the lifetime of this lease, Mr. Ford and his heirs and assigns and the company mentioned in the agreement hereby agree to manufacture and place upon the market a commercial fertilizer at 8 per cent profit throughout the lifetime of this lease."

Mr. MAYO. I could not answer that.

Mr. MILLER. That is what I am interested in. There are two angles to the tender, the fertilizer angle and the hydroelectric-power angle. Let us take the fertilizer angle. I am in sympathy with that, but I want to know where Mr. Ford agrees during the lifetime of this lease to supply the country with a complete fertilizer.

Mr. MAYO. That has always been his intention.

Mr. MILLER. That may be; but all this proposition is reduced to this written offer, and if the Government or the people are to rely upon anything, it must be upon this offer I hold in my hand. I am asking you if Mr. Ford would have any objection to putting a clause into this tender by which he agrees upon the death of himself, his heirs, and assigns, that the company which he shall organize and its successors shall manufacture and place upon the market during the lifetime of this lease a commercial fertilizer at not more than 8 per cent profit?

Mr. MAYO. I do not know that I could say that without talking it over with Mr. Ford.

Mr. MILLER. Then the commercial-fertilizer angle is indefinite as to what Mr. Ford or his company is going to do in the production of fertilizer.

Mr. MAYO. It states pretty plainly that the company agrees to operate the nitrate plant in the production of fertilizer compounds to the capacity of 110,000 tons of ammonium nitrate per annum.

Mr. MILLER. There is no place where I can find that he agrees to furnish the other ingredients of the fertilizer and put it upon the market.

Mr. MAYO. That is not stated clearly.

Mr. MILLER. Let us get at the principal thing you are after. To be perfectly frank about it, that is the hydroelectric power, is it not?

Mr. MAYO. I have not said so.

Mr. MILLER. That is the principle value of your contract, is it not?

Mr. MAYO. I do not think it is.

Mr. MILLER. What horsepower will be generated at Dam No. 2? There will be a primary horsepower of about 100,000, will there not?

Mr. MAYO. About 100,000 primary horsepower.

Mr. MILLER. And how much secondary power?

Mr. MAYO. Around 450,000 secondary horsepower.

Mr. MILLER. At Dam No. 2, or both dams?

Mr. MAYO. Dam No. 2.

Mr. MILLER. That would be 100,000 primary and 450,000 secondary horsepower? At Dam No. 3 you would produce probably 80,000 primary horsepower?

Mr. MAYO. About 40,000.

Mr. MILLER. Then, we have 140,000 primary horsepower on the two dams?

Mr. MAYO. Yes, sir; from the run of the river.

Mr. MILLER. Now, the secondary horsepower at Dam No. 2 is 450,000. What will it be at Dam No. 3?

Mr. MAYO. Two hundred thousand.

Mr. MILLER. Then, we have 140,000 primary horsepower and we have 650,000 secondary horsepower?

Mr. MAYO. Yes, sir.

Mr. MILLER. What is the value of horsepower in that locality? What have you figured it in making this offer?

Mr. MAYO. I do not know what the fair value of it is in that locality.

Mr. MILLER. I do not want to appear antagonistic; I am trying to get the facts. What have you used as a basis in making this offer? What do you base the value of the primary horsepower generated at this hydroelectric plant on, in making this offer?

Mr. MAYO. It all depends upon the success of the working out of the project.

Mr. MILLER. You have based it on an enormous income from that, have you not? That is, from the hydroelectric energy that would be produced there?

Mr. MAYO. This is to be taken as a whole, together with the nitrate plants and the other manufactures.

Mr. MILLER. Let us follow this a little further. There will be 140,000 primary horsepower produced at the two dams.

Mr. MAYO. Yes, sir.

Mr. MILLER. The Warrior plant produces approximately 30,000?

Mr. MAYO. Yes, sir.

Mr. MILLER. That is, 30,000 kilowatts?

Mr. MAYO. Yes.

Mr. MILLER. A kilowatt is more than a horsepower?

Mr. MAYO. Yes.

Mr. MILLER. About one-eighth more?

Mr. MAYO. About one-third more; a kilowatt is equal to about one and one-third horsepower.

Mr. MILLER. Then, you will produce over 30,000 horsepower at the Warrior plant?

Mr. MAYO. Yes.

Mr. MILLER. Then, the steam plant at nitrate plant No. 2 is capable of producing 60,000 kilowatts?

Mr. MAYO. Yes.

Mr. MILLER. That would be in excess of 60,000 horsepower?

Mr. MAYO. Yes.

Mr. MILLER. As I figure it up here, there would be about 230,000 primary horsepower in all those units which you are proposing to purchase or lease?

Mr. MAYO. Yes, sir; at least that much.

Mr. MILLER. Suppose you would sell it at \$18 a year per horsepower. That is a very cheap rate. If you did that your income from that would be approximately \$2,160,000 a year from the primary horsepower. That is at the cheap rate of \$18 per year per horsepower. I have also calculated on your secondary horsepower. According to your figures, you would have 650,000 horsepower. I had calculated on 400,000. If you were to sell that for \$8 per horsepower per year, which is a small rate, your income would be \$3,200,000, according to my calculation. So that if you sell your primary horsepower at \$18 per horsepower per year, and sell your secondary horsepower at \$8 per horsepower per year, your income would be approximately \$8,160,000 from the sale of your horsepower each year. So, it occurs to me that the horsepower is what you are after.

Mr. MAYO. We are after cheap power, certainly.

Mr. MILLER. You are generating there 230,000 primary horsepower, and 650,000 secondary horsepower, which is an enormous water power, is it not?

Mr. MAYO. Yes, sir.

Mr. MILLER. If you sell your primary horsepower at \$18 and your secondary horsepower at \$8, the company will have an income of over \$8,000,000 a year.

Mr. MAYO. I have not checked up your figures, but you are evidently wrong.

Mr. MILLER. I understand you have based this offer of Mr. Ford's on certain calculations. How far am I away from those calculations?

Mr. MAYO. Mr. Ford intends to use that power himself. It is not a question of selling the power.

Mr. MILLER. If he uses the power himself it will certainly yield him that much money, will it not?

Mr. MAYO. No; you have assumed a 100 per cent load factor.

Mr. MILLER. Would he use the power himself at a less rate than he can sell it for?

Mr. MAYO. Certainly; but he could not use every kilowatt-hour that he generates.

Mr. MILLER. You mean Mr. Ford is undertaking to supply himself with horsepower at less than the commercial rate—is that the idea?

Mr. MAYO. I do not quite get your question.

Mr. MILLER. If he is planning to purchase electric energy himself at less than the commercial rates; that is the question?

Mr. MAYO. Certainly.

Mr. MILLER. That would give him an extraordinary advantage in this line, would it not?

Mr. MAYO. We hope so; there could be no promise of cheap fertilizer otherwise.

Mr. MILLER. The Government in advancing \$50,000,000 to complete these two dams would have to pay certain interest on that amount. Let us start on that proposition and see where the Government is coming out. Suppose we pay a rate of interest equal to what we are paying on our present Liberty loans, 4½ per cent. On the \$50,000,000 at 4½ per cent interest, the amount of interest the Government would have to pay would be \$2,225,000 a year to supply the \$50,000,000 to complete the dams. That is right, is it not?

Mr. MAYO. I take it for granted that you are correct.

Mr. MILLER. Taking it on the basis of \$45,000,000, for which you say the dams can be completed, suppose the Government issues bonds bearing the same rate of interest that our Liberty loan bonds bear, the Government's annual interest charge would be \$1,912,500. That is the amount we would have to pay every year of the world for 100 years, until your plant amortizes itself. That is right, is it not?

Mr. MAYO. I think so, if your figures are correct.

Mr. MILLER. During that period you pay for the first six years \$200,000 on Dam No. 2.

Mr. MAYO. Yes; \$200,000 per year.

Mr. MILLER. And you pay \$160,000 a year for three years on Dam No. 3?

Mr. MAYO. Yes; I believe that is correct.

Mr. MILLER. That makes \$360,000 a year you pay because, the interest on your investment has not yet commenced. That will be an income to the Government of \$360,000 a year, plus this \$55,000 a year you pay for the maintenance of the dams. Does that commence on the signing of the contract or does it commence when the dams are in a position to generate power? I see that the agreement provides for the payment of \$35,000 to maintain Dam No. 2?

Mr. MAYO. Yes, sir.

Mr. MILLER. And \$20,000 a year to maintain Dam No. 3?

Mr. MAYO. Yes.

Mr. MILLER. Do those payments commence coincident with the signing of the contract, or do they commence when the dams are completed?

Mr. MAYO. When the dams are completed.

Mr. MILLER. The contract is silent on that.

Mr. MAYO. You can not expect us to pay for maintenance when the dams are not completed.

Mr. MILLER. On Dam No. 2, and for the first three years on Dam No. 3, you will have to pay \$55,000 a year; is that right?

Mr. MAYO. There will be no maintenance on the dams till they are completed.

Mr. MILLER. If there is no maintenance on the dams all your company would have to pay would be \$200,000 a year for six years on Dam No. 2 and \$160,000 a year for three years on Dam No. 3, which makes a total of \$360,000 a year.

Mr. MAYO. That is correct.

Mr. MILLER. As against that the Government has to pay out \$2,225,000 a year in interest, figuring on the rate of interest at 4½ per cent.

Mr. MAYO. I think you are correct. I am not sure.

Mr. MILLER. Let us take that from the Government angle. It is our duty, I take it, to watch out to see where the Government is coming out. Every year for 100 years the Government will have to pay an annual interest charge of \$2,225,000, provided it can borrow this money at 4½ per cent. That would be the interest on our bonds.

Mr. MAYO. We think you can borrow it for less.

Mr. MILLER. How much?

Mr. MAYO. At 4 per cent.

Mr. MILLER. We pay 4½ per cent on our Liberty bonds, and we have had great difficulty in getting those to par. As I figure it, the Government can not get out on anything short of \$2,225,000 for the annual interest charge for 100 years. At the end of that 100 years you are paying into an amortization fund \$5,505 semiannually on dam No. 3, and \$19,760 on dam No. 2, which, placed at 4 per cent interest, you figure will aggregate \$40,000,000 at the end of your lease period. Those are your figures, are they not?

Mr. MAYO. I think so, approximately.

Mr. MILLER. Your annual outlay there, as far as the company is concerned, is \$49,000 a year in your amortization fund. That is what you pay into the Government?

Mr. MAYO. That is about right, \$46,746 to be exact.

Mr. MILLER. You will pay to the Government in addition \$55,000 after the locks are completed, for the maintenance of the locks at the two dams, \$35,000 at dam No. 2, and \$20,000 at dam No. 3. That is right, is it not?

Mr. MAYO. For the maintenance of the locks and dams; yes, sir.

Mr. MILLER. You will be paying to the Government on the amortization fund \$49,000, plus \$55,000 for the care of your locks, and that is what the Government will get in order to offset its interest charge of \$2,225,000 per annum. And to that must be added the rental you will pay?

Mr. MAYO. Yes, sir; and the income from the amortization fund.

Mr. MILLER. If you pay 4 per cent on the actual cost of building that dam, and we figure on a basis of \$50,000,000 as the cost of building the dams, the interest paid to the United States Government after the end of the 6-year period on dam No. 2 and the end of the 3-year period on dam No. 3 will be \$2,000,000 a year.

Mr. MAYO. I do not think your premises are correct.

Mr. MILLER. Figuring on a basis of \$50,000,000 to build the dams?

Mr. MAYO. We do not think it will cost that much.

Mr. MILLER. How much?

Mr. MAYO. \$40,000,000 or less.

Mr. MILLER. That would mean \$1,600,000 a year, which is the interest your company would pay?

Mr. MAYO. Yes.

Mr. MILLER. And your company is charged with paying to the United States Government \$1,600,000, which you estimate is the rental?

Mr. MAYO. Yes, sir.

Mr. MILLER. You will pay \$55,000 for the maintenance of the locks on the dams. It is also to pay into the amortization fund \$49,000 a year. Those are all the charges, are they not?

Mr. MAYO. I think so.

Mr. MILLER. What will that total be?

Mr. MAYO. It is \$1,704,000, on the basis you have taken.

Mr. MILLER. That is what it will cost you folks to operate your company. That is what your expenses will be. Figuring on the water power you will generate at the prices I have given, \$18 a year per horsepower on primary horsepower and \$8 a year on secondary horsepower, and figuring on the basis of the capacity of these generating plants, the Warrior plant, the nitrate steam plant, nitrate plant No. 2, and the two dams, they will generate collectively 270,000 horsepower, on which the income of your company will be \$8,760,000, approximately, and your expenses will be \$1,704,000. These are the figures as I make them out in connection with this hydroelectric power proposition.

Mr. MAYO. I think your premises are all wrong. The cost of both the waterpower and the steam power will go into the cost of the product, with such a combination.

Mr. MILLER. You will certainly add some sum for the waterpower product. Will you not?

Mr. MAYO. Not much.

Mr. MILLER. You do not mean that you are going to generate power down there without keeping track of how much power you generate and where it is going and what it is going to cost for its distribution?

Mr. MAYO. Certainly, we will keep the cost.

Mr. MILLER. And does not Mr. Ford keep accurate accounts in his factory?

Mr. MAYO. Certainly.

Mr. MILLER. I am sure he does, and I am therefore surprised to find that on this gigantic enterprise he will run it on a different principle from the principle on which he runs his other very successful enterprises.

Mr. MAYO. He will not be running it on a different principle. He will figure what the power is costing him into the cost of his product on the basis of the actual cost. But you are figuring on what the power is costing on the basis of what the horsepower sold by a utility company would be, and that is not the way he figures it in his cost.

Mr. MILLER. Suppose Mr. Ford did not turn a wheel at his own enterprise down there and sold his horsepower output in all these four plants, and sold it at the price I have indicated, which I have said is a low price. On that basis

I find, by my computation, that your company would have a profit of \$4,370,000 a year, and not put in a dollar except the \$5,000,000.

Mr. MAYO. I am coming back at you with your statement, and I say that your premises and your calculations are all wrong. He wants to make his power cheap. He is not at all interested in "what the traffic will bear."

Mr. MILLER. I would like to get that right. I take your word for the primary horsepower.

Mr. MAYO. The quantities are correct.

Mr. MILLER. I have taken the price at my estimates, and I am inquiring where my premise is wrong.

Mr. MAYO. It is wrong in that he will take the horsepower at its cost. Your estimate of cost is wrong and your estimate of selling price is wrong.

Mr. MILLER. Then I revert to the question I asked you before. He is supplying his industries at a horsepower cost entirely below the salable value of horsepower?

Mr. MAYO. We hope it will be; yes, sir.

Mr. MILLER. Then the margin, of course, will be governed, so far as the sale is concerned, by the neighborhood price; is that not true?

Mr. MAYO. No, sir; the neighborhood price has nothing to do with our figures.

Mr. MILLER. That is an angle of it that I had not thought of. There are very substantial enterprises in northern Alabama, with considerable investments in water power, are there not?

Mr. MAYO. There is no great waterpower in that vicinity.

Mr. MILLER. The Alabama Power Co. have some hydroelectric power plants?

Mr. MAYO. Yes, sir; in central Alabama.

Mr. MILLER. They have quite a substantial investment there?

Mr. MAYO. I believe so.

Mr. MILLER. If Mr. Ford can develop power at much less than the Alabama Power Co. can do it, the company owning its own land, you would drive those people out of business, would you not?

Mr. MAYO. No, sir.

Mr. MILLER. Have you any idea of an amalgamation of these two companies?

Mr. MAYO. No, sir.

Mr. MILLER. I wish you would explain how that can be done.

Mr. MAYO. I am trying to explain that your premises are all wrong. You seem to be analyzing this subject from a public utility point of view, but that is not Mr. Ford's intention, to start a power company for the sale of power; that is not his intention at all.

Mr. MILLER. Then the proposition is that he will use this 270,000 horsepower all himself?

Mr. MAYO. That is his intention.

Mr. MILLER. Then he is supplying himself with a very cheap source of power.

Mr. MAYO. That is the hope.

Mr. MILLER. And the Government in order to supply him with that cheap source of power is doing it at an expense of over a million and three-quarters of dollars a year?

Mr. MAYO. I do not agree with you.

Mr. MILLER. Where am I wrong?

Mr. MAYO. You have taken the cost at \$50,000,000.

Mr. MILLER. I take it at \$45,000,000, your figures, and I will take the rate of interest on our Liberty bonds, $4\frac{1}{2}$ per cent.

Mr. MAYO. We think you can place it at 4 per cent.

Mr. MILLER. That makes a very small difference, about \$125,000. Where am I wrong?

Mr. MAYO. You are wrong in regard to the cost.

Mr. MILLER. Then I go back to my first question, that the hydroelectric power is what Mr. Ford is after there, and not the fertilizer end of it at all.

Mr. MAYO. I will be glad to put a statement in the record in regard to that particular point.

WHAT MR. FORD PAYS FOR POWER.

[On the basis of the estimate of the Chief of Engineers, U. S. Army.]

The Chief of Engineers' estimate of the absolute primary power at Dam No. 2 is 435,000,000 kilowatt hours, and at Dam No. 3 is 173,000,000 kilowatt hours,

¹ Letter of Gen. Beach, Aug. 15, 1921.

Mr. MILLER. Your annual outlay there, as far as the company is concerned, is \$49,000 a year in your amortization fund. That is what you pay into the Government?

Mr. MAYO. That is about right, \$46,746 to be exact.

Mr. MILLER. You will pay to the Government in addition \$55,000 after the locks are completed, for the maintenance of the locks at the two dams, \$35,000 at dam No. 2, and \$20,000 at dam No. 3. That is right, is it not?

Mr. MAYO. For the maintenance of the locks and dams; yes, sir.

Mr. MILLER. You will be paying to the Government on the amortization fund \$49,000, plus \$55,000 for the care of your locks, and that is what the Government will get in order to offset its interest charge of \$2,225,000 per annum. And to that must be added the rental you will pay?

Mr. MAYO. Yes, sir; and the income from the amortization fund.

Mr. MILLER. If you pay 4 per cent on the actual cost of building that dam, and we figure on a basis of \$50,000,000 as the cost of building the dams, the interest paid to the United States Government after the end of the 6-year period on dam No. 2 and the end of the 3-year period on dam No. 3 will be \$2,000,000 a year.

Mr. MAYO. I do not think your premises are correct.

Mr. MILLER. Figuring on a basis of \$50,000,000 to build the dams?

Mr. MAYO. We do not think it will cost that much.

Mr. MILLER. How much?

Mr. MAYO. \$40,000,000 or less.

Mr. MILLER. That would mean \$1,600,000 a year, which is the interest your company would pay?

Mr. MAYO. Yes.

Mr. MILLER. And your company is charged with paying to the United States Government \$1,600,000, which you estimate is the rental?

Mr. MAYO. Yes, sir.

Mr. MILLER. You will pay \$55,000 for the maintenance of the locks on the dams. It is also to pay into the amortization fund \$49,000 a year. Those are all the charges, are they not?

Mr. MAYO. I think so.

Mr. MILLER. What will that total be?

Mr. MAYO. It is \$1,704,000, on the basis you have taken.

Mr. MILLER. That is what it will cost you folks to operate your company. That is what your expenses will be. Figuring on the water power you will generate at the prices I have given, \$18 a year per horsepower on primary horsepower and \$8 a year on secondary horsepower, and figuring on the basis of the capacity of these generating plants, the Warrior plant, the nitrate steam plant, nitrate plant No. 2, and the two dams, they will generate collectively 270,000 horsepower, on which the income of your company will be \$8,760,000, approximately, and your expenses will be \$1,704,000. These are the figures as I make them out in connection with this hydroelectric power proposition.

Mr. MAYO. I think your premises are all wrong. The cost of both the waterpower and the steam power will go into the cost of the product, with such a combination.

Mr. MILLER. You will certainly add some sum for the waterpower product, will you not?

Mr. MAYO. Not much.

Mr. MILLER. You do not mean that you are going to generate power down there without keeping track of how much power you generate and where it is going and what it is going to cost for its distribution?

Mr. MAYO. Certainly, we will keep the cost.

Mr. MILLER. And does not Mr. Ford keep accurate accounts in his factory?

Mr. MAYO. Certainly.

Mr. MILLER. I am sure he does, and I am therefore surprised to find that on this gigantic enterprise he will run it on a different principle from the principle on which he runs his other very successful enterprises.

Mr. MAYO. He will not be running it on a different principle. He will figure what the power is costing him into the cost of his product on the basis of the actual cost. But you are figuring on what the power is costing on the basis of what the horsepower sold by a utility company would be, and that is not the way he figures it in his cost.

Mr. MILLER. Suppose Mr. Ford did not turn a wheel at his own enterprise down there and sold his horsepower output in all these four plants, and sold it at the price I have indicated, which I have said is a low price. On that basis

I find, by my computation, that your company would have a profit of \$4,370,000 a year, and not put in a dollar except the \$5,000,000.

Mr. MAYO. I am coming back at you with your statement, and I say that your premises and your calculations are all wrong. He wants to make his power cheap. He is not at all interested in "what the traffic will bear."

Mr. MILLER. I would like to get that right. I take your word for the primary horsepower.

Mr. MAYO. The quantities are correct.

Mr. MILLER. I have taken the price at my estimates, and I am inquiring where my premise is wrong.

Mr. MAYO. It is wrong in that he will take the horsepower at its cost. Your estimate of cost is wrong and your estimate of selling price is wrong.

Mr. MILLER. Then I revert to the question I asked you before. He is supplying his industries at a horsepower cost entirely below the salable value of horsepower?

Mr. MAYO. We hope it will be; yes, sir.

Mr. MILLER. Then the margin, of course, will be governed, so far as the sale is concerned, by the neighborhood price; is that not true?

Mr. MAYO. No, sir; the neighborhood price has nothing to do with our figures.

Mr. MILLER. That is an angle of it that I had not thought of. There are very substantial enterprises in northern Alabama, with considerable investments in water power, are there not?

Mr. MAYO. There is no great waterpower in that vicinity.

Mr. MILLER. The Alabama Power Co. have some hydroelectric power plants?

Mr. MAYO. Yes, sir; in central Alabama.

Mr. MILLER. They have quite a substantial investment there?

Mr. MAYO. I believe so.

Mr. MILLER. If Mr. Ford can develop power at much less than the Alabama Power Co. can do it, the company owning its own land, you would drive those people out of business, would you not?

Mr. MAYO. No, sir.

Mr. MILLER. Have you any idea of an amalgamation of these two companies?

Mr. MAYO. No, sir.

Mr. MILLER. I wish you would explain how that can be done.

Mr. MAYO. I am trying to explain that your premises are all wrong. You seem to be analyzing this subject from a public utility point of view, but that is not Mr. Ford's intention, to start a power company for the sale of power; that is not his intention at all.

Mr. MILLER. Then the proposition is that he will use this 270,000 horsepower all himself?

Mr. MAYO. That is his intention.

Mr. MILLER. Then he is supplying himself with a very cheap source of power.

Mr. MAYO. That is the hope.

Mr. MILLER. And the Government in order to supply him with that cheap source of power is doing it at an expense of over a million and three-quarters of dollars a year?

Mr. MAYO. I do not agree with you.

Mr. MILLER. Where am I wrong?

Mr. MAYO. You have taken the cost at \$50,000,000.

Mr. MILLER. I take it at \$45,000,000, your figures, and I will take the rate of interest on our Liberty bonds, 4½ per cent.

Mr. MAYO. We think you can place it at 4 per cent.

Mr. MILLER. That makes a very small difference, about \$125,000. Where am I wrong?

Mr. MAYO. You are wrong in regard to the cost.

Mr. MILLER. Then I go back to my first question, that the hydroelectric power is what Mr. Ford is after there, and not the fertilizer end of it at all.

Mr. MAYO. I will be glad to put a statement in the record in regard to that particular point.

WHAT MR. FORD PAYS FOR POWER.

[On the basis of the estimate of the Chief of Engineers, U. S. Army.]

The Chief of Engineers' estimate of the absolute primary power at Dam No. 2 is 435,000,000 kilowatt hours, and at Dam No. 3 is 173,000,000 kilowatt hours,

¹ Letter of Gen. Beach, Aug. 15, 1921.

a total of 608,000,000 kilowatt hours annually, based upon the 21-year record of flow.

Since Mr. Ford's payments to the Government for power purposes total \$1,781,746 annually, he pays as rental for this primary power, on the foregoing basis, 2.9 mills per kilowatt hour, or \$18.95 per horsepower year on a 100 per cent load factor basis.

This is more than twice the amount which the Aluminum Co. of America is said to pay for primary power at Niagara Falls. It is nearly twice the amount which the American Cyanamid Co. pays, as testified to by Mr. Washburn; it is about 75 per cent of the minimum price at which power is retailed in the city of Chattanooga. For example, the Southern Ferro Alloys Co. pays a minimum of 4 mills per kilowatt hour, or about \$26 per horsepower year for the power they use.

Mr. Ford pays for the power whether he uses it or not. No one has ever attained a 100 per cent load factor in the practical operation of any industrial plant.

If Mr. Ford does as well as the consumers of the power from the Keokuk Dam, he will have an average load factor of about 54 per cent, and his absolute primary power on the above basis will cost him about 5.3 mills per kilowatt hour, or \$34.61 per horsepower year for the primary power which he is able to use.

As for the secondary power, the southeastern power companies have declared that it has no commercial value. Be that as it may in their cases, the fact remains that the only reason that Mr. Ford has been able to make his offer is because he can use much of the secondary power and because he can find in the upper tributaries of the Tennessee River and elsewhere the storage that enables him at large expense to convert a large part of this secondary power into primary power.

Mr. MILLER. I want to learn all I can about this, Mr. Mayo. It strikes me this way: Is there anything in the taxation laws of Alabama by which a leasehold interest is taxed at a less rate than a title in fee?

Mr. MAYO. I do not know about that.

Mr. MILLER. Have you investigated the laws of Alabama in that regard?

Mr. MAYO. No.

Mr. MILLER. I am frank to say I do not know what the law is on that, and I have a letter on the way to the attorney general of Alabama to get a statement of the taxation laws that will be applied to Mr. Ford's enterprise. It occurs to me that that will be quite an item. How would this proposition strike you? Suppose the United States Government would allow Mr. Henry Ford's company to have nitrate plant No. 2 as a free occupying tenant during the lifetime of the lease for 100 years, not pay a cent for it, the only limitation upon it being that he will keep it in readiness for the production of ammonium nitrate as a matter of nitrate preparedness, the fee to remain in the Government, and he to obligate himself to occupy nitrate plant No. 2 in the production of fertilizer. Do you suppose that proposition would be entertained by Mr. Ford?

Mr. MAYO. No, sir; that would prevent him from changing nitrate plant No. 2.

Mr. MILLER. It would prevent him from changing to a different process?

Mr. MAYO. Yes.

Mr. MILLER. Suppose there should be a provision in the lease for the manufacture of ammonium nitrate by the cyanamid process at plant No. 2, or any process of manufacture they discover to be less expensive.

Mr. MAYO. He might want to make large investments of his own money in additions to the present plant.

Mr. MILLER. We would provide for that in the contract. He could invest whatever money he pleased.

Mr. MAYO. He would not want to invest it on the Government's property.

Mr. MILLER. What I am getting after is the maintenance of nitrate plant No. 2, in readiness to instantly meet a war necessity in connection with ammonium nitrate.

* Mr. Ford pays annually: Interest, \$1,680,000 (on a cost of \$40,000,000); retirement fund, \$46,746; maintenance, \$55,000; total, \$1,781,746.

* Hearings before House Committee on Agriculture, 64th Cong., 1st sess., on Agricultural appropriation bill, Feb. 9, 1916, p. 28.

* Supplement to Hearings before Subcommittee of House Committee on Appropriations on sundry civil appropriation bill for 1922, 66th Cong., 3d sess., Feb. 14, 1921, Table LXII, line 18, p. 56.

Mr. MAYO. You will guard yourself as well by selling it to him.

Mr. MILLER. Suppose we do not want to sell it, but want to keep the title to it and let him use it free of charge?

Mr. MAYO. I do not think he could afford to use it on that basis.

(Thereupon, at 4.30 o'clock, the committee adjourned, to meet to-morrow, Tuesday, February 14, 1922, at 10 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES.
Tuesday, February 14, 1922.

The committee met at 10 o'clock a. m.. Hon. Julius Kahn (chairman) presiding.

**STATEMENT OF MR. WILLIAM B. MAYO, CHIEF ENGINEER OF THE
FORD MOTOR CO., DETROIT, MICH.—Resumed.**

Mr. MILLER. Mr. Mayo, I recasted my figures last night and I will ask you if you recasted yours and found wherein my figures were wrong yesterday?

Mr. MAYO. You speak with reference to the figures made as to the cost to the Government during the first few years?

Mr. MILLER. Yes.

Mr. MAYO. We have made up a little statement of the cost to the Government during the first six-year period, as we see it.

Mr. MILLER. You will recall that my figures yesterday were based on a cost of \$50,000,000 for the dams and interest at the rate of 4½ per cent.

Mr. MAYO. Yes, sir.

Mr. MILLER. The same rate that most of our Liberty loan bonds bear.

Mr. MAYO. Yes, sir.

Mr. MILLER. Let me take your own figures, on the basis of \$40,000,000 as the cost of the two dams, the completion of Dam No. 2 and the entire construction of Dam No. 3, with the money at 4 per cent.

Mr. MAYO. Yes, sir.

Mr. MILLER. That is the basis on which you are figuring on financing the proposition.

Mr. MAYO. We based our figures on \$42,000,000; in fact, on \$42,230,000.

Mr. MILLER. Your figures yesterday were \$40,000,000.

Mr. MAYO. Yes, sir; with an outside estimate of \$45,000,000.

Mr. MILLER. Now you have gone up \$2,000,000.

Mr. MAYO. I am not going up. Our estimates which we handed in, as to what we thought the cost might be, are the exact figures, \$42,230,000.

Mr. MILLER. \$42,230,000?

Mr. MAYO. Yes; although we are of the opinion it can be done for still less, but inasmuch as we put in that figure we made up our statement here on that basis.

Mr. MILLER. My understanding yesterday was that you had based the cost of these two dams at \$40,000,000.

Mr. MAYO. Yes, sir.

Mr. MILLER. So that I prepared my figures which I will go over with you on the basis of \$40,000,000 for the dams.

Mr. MAYO. Yes.

Mr. MILLER. And my inquiry is to ascertain where the Government is getting off. Now, there are two dams—Dam No. 2 and Dam No. 3—and Dam No. 2 is partially constructed and Dam No. 3 is entirely to be constructed.

Mr. MAYO. Yes, sir.

Mr. MILLER. We will take up first Dam No. 2 and on the basis of \$20,000,000 the annual charge for interest at 4 per cent would be \$800,000 a year; is that correct?

Mr. MAYO. That is right; yes, sir.

Mr. MILLER. For the 2-year period, which it will take to construct the dam, the Government is out two years' interest at 8 per cent which is \$1,600,000.

Mr. MAYO. It is out half of that.

Mr. MILLER. Half of it?

Mr. MAYO. Yes, sir.

Mr. MILLER. Well, we will figure on half of it, do you think both of these dams can be constructed in a year.

Mr. MAYO. No, sir.

Mr. MILLER. I did not think so either, but you said to cut that in half.

Mr. MAYO. I meant that. We would only take our money as we needed it for construction, which would require one-half of the amount of interest you mention.

Mr. MILLER. I am not talking about your side of it, I am talking about the Government's angle.

Mr. MAYO. I am too.

Mr. MILLER. The Government will have to have \$40,000,000 ready in order to finance your scheme.

Mr. MAYO. No, sir; I do not think so.

Mr. MILLER. If you can figure out any other way of selling the bonds in serial form and getting me the money as it is needed at an interest rate of 4 per cent, I will say that such a thing as that was never known in the history of finances in this country, Mr. Mayo.

Mr. MAYO. Gen. Beach, the Chief of Engineers, figures it on the same basis.

Mr. MILLER. At 5 per cent.

Mr. MAYO. I mean in the same manner we are talking about.

Mr. MILLER. But he figures on a 5 per cent basis and your figures are on a 4 per cent basis.

Mr. MAYO. I understand, but I mean he figured it in the same manner.

Mr. MILLER. He figured it on a partial payment scheme with the money going in on a 5 per cent basis?

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, you are figuring on partial payments and the money going in on a 4 per cent rate which is one-fourth of 1 per cent below the interest rate on Liberty bonds, and you are figuring on the delivery of those bonds as the money is needed. I will ask you if you have made any investigations of the money market of this country in order to get money on those terms?

Mr. MAYO. We have been led to believe it can be gotten at 4 per cent; yes, sir.

Mr. MILLER. Without betraying any secrets, is there any offer to give money at that price?

Mr. MAYO. We have not asked for it. Mr. Ford was invited by the Government to make this offer and he has made what he considers the best offer he cares to make.

Mr. MILLER. Your offer is at 4 per cent to finance this thing by the Government lending its credit.

Mr. MAYO. Our offer simply states what Mr. Ford is willing to give.

Mr. MILLER. And you are figuring on the Government lending its credit to this enterprise at 4 per cent.

Mr. MAYO. Yes, sir.

Mr. MILLER. That is the basis of your financing?

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, we will take up this dam, the cost of which is \$20,000,000, the annual interest at 4 per cent would be \$800,000 a year.

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, I take it you do not intend to commence the construction of Dam No. 3 until you have completed Dam No. 2?

Mr. MAYO. Not necessarily.

Mr. MILLER. Now turn to clause 6 of your contract, and while I understand you do not intend necessarily to do that, yet you have provided for that in clause 6, which reads as follows:

"As soon as the release of suitable construction equipment and labor forces at Dam No. 2 will permit, or at an earlier date if desired by the company, the company shall construct and complete for the United States Dam No. 3, its lock, powerhouse," etc. You do not mean to construct both of these dams simultaneously, do you?

Mr. MAYO. We might; yes, sir.

Mr. MILLER. Is there not very valuable machinery and hoisting apparatus and concrete mixers, etc., that you would have to duplicate if you intended to carry on the construction of both of these dams at the same time?

Mr. MAYO. Yes; but as you get along with the work on one dam you can commence to take away apparatus and put it on the other.

Mr. MILLER. Yes; but your apparatus will have to remain on Dam No. 2 until Dam No. 2 is completed; that is a portion of the apparatus.

Mr. MAYO. Yes; a portion of the apparatus.

Mr. MILLER. The concrete mixers, for instance, which are the principal things.

Mr. MAYO. They would all be built over for the other dam anyway.

Mr. MILLER. Of course, your compressors and things of that sort may be taken out. Now, we will figure that annual charge at 4 per cent, \$800,000 a year, and we will figure on the two years period of construction. You say it can be done in one?

Mr. MAYO. I did not say so.

Mr. MILLER. It could be done in two years?

Mr. MAYO. I think that is the maximum needed time.

Mr. MILLER. The Government, then, will be out \$1,600,000 on its interest fund in the two years. Now, you have a six-year period of flat payments of interest after the dam is completed or after 100,000 horsepower is generated. In other words, your lease period begins when dam No. 2 is capable of generating 100,000 horsepower.

Mr. MAYO. Yes, sir.

Mr. MILLER. It is practically completed then?

Mr. MAYO. Yes, sir; all but the power house.

Mr. MILLER. That is a six-year period at a flat rate of interest of \$200,000 a year.

Mr. MAYO. That is right; yes.

Mr. MILLER. In the six-year period you will be paying in \$200,000 a year on your flat interest payment and the Government will be paying out \$800,000 a year in interest; or, in other words, the Government will be losing \$600,000 a year; that is right, is it not?

Mr. MAYO. I think not. The Government will pay out the amount you state, but the credits will offset more than the Government pays out.

Mr. MILLER. Then in six years it will be six times \$600,000, or \$3,600,000, that the Government will lose.

Mr. MAYO. We do not figure the Government will lose it; no.

Mr. MILLER. That is what the Government will be out on these bonds, is it not?

Mr. MAYO. We do not think so.

Mr. MILLER. Why not?

Mr. MAYO. We have prepared a statement that shows a credit in favor of the Government at the end of six years.

NOTE.—The statement referred to will be found on page 301.

Mr. MILLER. I do not care anything about your statement, I want you to follow my figures, Mr. Mayo, because this matter has got to be explained on the floor of the House to our colleagues, and I want to be sure to get it right, and that is the reason I was so earnest yesterday. The members of this committee have got to explain to our colleagues this whole matter on the floor of the House. During the six-year period, after the completion of the dam, which is the period of your flat payment of interest, you will pay in twice \$600,000, or \$1,200,000 in the six years.

Mr. MAYO. Yes, sir; six times \$200,000 is \$1,200,000.

Mr. MILLER. The Government's interest will be at the rate of \$800,000 a year for the six-year period or \$4,800,000.

Mr. MAYO. Yes, sir.

Mr. MILLER. In other words, the Government is out \$600,000 a year in the interest it will have to pay out more than you pay the Government under your flat payment of interest.

Mr. MAYO. But there are a number of offsets which make the final figure in favor of the Government.

Mr. MILLER. We will get to those offsets later. The Government is out \$600,000 a year during that six-year period, is it not?

Mr. MAYO. I do not think they are out that; no, sir.

Mr. MILLER. That is the amount of interest the Government will have to pay on its issue of \$20,000,000 worth of bonds for that dam.

Mr. MAYO. Yes, sir.

Mr. MILLER. The Government will have to pay that \$600,000 a year; and you pay the Government, or your company, rather, pays the Government your flat rate of \$200,000 a year for the six years.

Mr. MAYO. Yes, sir.

Mr. MILLER. And you do not commence to pay any interest until the end of the third year, do you?

Mr. MAYO. No, sir.

Mr. MILLER. Then there are three years when the Government will have to pay interest at the rate of 4 per cent per annum and get nothing from you, because you do not pay any interest until the dams are completed, do you?

Mr. MAYO. We do not get anything to pay a rental for until the dams are completed.

Mr. MILLER. You get 100,000 horsepower ready to be delivered to-morrow from the two steam plants, do you not?

Mr. MAYO. Yes; but that is an entirely different matter.

Mr. MILLER. Just answer my question, please. You get 100,000 horsepower ready for delivery to-morrow from the two steam plants?

Mr. MAYO. Yes, sir.

Mr. MILLER. With a title in fee. Then during all of this period when the Government is paying 8 per cent interest, and you are paying a flat rate of \$200,000, you have in addition to that the use of 100,000 horsepower from the two steam plants?

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, taking the 2-year period of construction, the Government will be out \$1,600,000 of interest, and on the 6-year period that you pay a flat rate of interest, the Government is out \$4,800,000 in interest, and you will pay the Government \$1,200,000 in interest on the flat rate, and at the end of the 8-year period, the 6-year period of the flat payment of interest and the 2-year period of construction, the Government will have paid out \$5,200,000 more than you have paid the Government. Is that right?

Mr. MAYO. I do not think so.

Mr. MILLER. Now, just tell me wherein I am wrong.

Mr. MAYO. As I say, there are a number of offsets.

Mr. MILLER. I am basing it on this interest period. We will get to those offsets later.

Mr. MAYO. The Government will pay out that much money in interest; yes, sir.

Mr. MILLER. We will be out then in eight years when you commence to pay interest on the flat rate which will be eight years from now?

Mr. MAYO. Six years.

Mr. MILLER. On dam No. 2.

Mr. MAYO. Six years, I think.

Mr. MILLER. Six years after the dam is completed?

Mr. MAYO. Yes; but your money is not all invested until it is completed.

Mr. MILLER. Yes; it is invested in two years when the dams will be completed; every dollar that the Government has put in that dam will be invested in two years, and after the Government has invested every dollar that goes into the dam, then there is a period of six years that you pay a flat rate of interest.

Mr. MAYO. That is only partly correct.

Mr. MILLER. Then, up to the time you begin to pay interest at the flat rate of 4 per cent on the investment, the Government will have paid out in interest \$5,200,000 more than you have paid the Government.

Mr. MAYO. I think you are wrong.

Mr. MILLER. The Government excess on Dam No. 2 is \$5,200,000. That is what the Government is out over and above what it has received from your company.

Now we will take Dam No. 3—the same cost, \$20,000,000; the same rate of interest, 4 per cent; the same interest charge per year of \$800,000—and take the two-year period of construction; and by the way, if you do not commence Dam No. 3 until you have completed Dam No. 2, it will be a three-year period of construction, and \$800,000 more; but, provided you can complete Dam No. 3 also within the two-year period, we are out \$1,600,000 interest on that at the rate of 4 per cent on the cost of the dam during that two-year period of construction. Now, at the end of two years the Government has got every dollar in that dam it will put in, and the dam is completed, capable of generating 80,000 horsepower; that is the rate, is it not?

Mr. MAYO. Yes.

Mr. MILLER. Now, you have a three-year flat rate of interest on Dam No. 3, instead of six years on Dam No. 2?

Mr. MAYO. Yes, sir.

Mr. MILLER. Take, then, the two-year period of construction and your three years of flat rate of interest, and again you do not pay anything until the end

of the third year or you do not pay anything until one year after Dam No. 3 is completed; that is right, is it not?

Mr. MAYO. Practically so.

Mr. MILLER. It is actually right, is it not? That is the wording of the contract.

Mr. MAYO. The contract states one year from the date when 80,000 horsepower is installed.

Mr. MILLER. That is, one year after the dam is completed, because you say when 80,000 horsepower is generated the dam is completed, practically.

Mr. MAYO. Practically.

Mr. MILLER. And you do not pay even the flat rate of interest until a year after that time.

Mr. MAYO. The entire amount of money is not in the dam at that time.

Mr. MILLER. The dam is completed.

Mr. MAYO. But all the apparatus that goes into the power house is not.

Mr. MILLER. I am not talking about the apparatus.

Mr. MAYO. Or the power house.

Mr. MILLER. But the dam is completed and, of course, during the period of construction of the dam you will be working on installing this machinery, will you not?

Mr. MAYO. The power house and machinery is the most expensive portion of the dam.

Mr. MILLER. It is very expensive, I will admit that; but I would not say the most expensive. Do you think it is the most expensive?

Mr. MAYO. Exactly so, sir.

Mr. MILLER. Well, it is a very expensive proposition, but when the power house is completed you will have your machinery ready to install, of course, on the ground.

Mr. MAYO. We hope to.

Mr. MILLER. So there will be practically no interval, and will not take you very long—not over three months.

Mr. MAYO. It may be a year or more.

Mr. MILLER. If it is a year you have given yourself that year when you do not pay any interest at all. That is the basis on which you are financing it?

Mr. MAYO. We have got to build up our load for it to get any return out of it.

Mr. MILLER. I am not talking about that. I am saying that within a year after your dam is completed and the Government has its investment there, you do not pay even the flat rate of interest, because your flat rate of interest does not commence until one year after the dam is capable of generating 80,000 horsepower.

Mr. MAYO. That is not correct. The first interest payment is made one year after 80,000 horsepower of equipment is installed, but that payment covers the preceding and not the following year. We pay interest from the date the 80,000 horsepower is ready.

Mr. MILLER. Now, we will follow that through. Take the two-year period of construction, the same as we did before; the Government is again out on Dam No. 3, \$1,600,000. Now, we will take your three-year flat rate of interest, and you pay \$160,000 on Dam No. 3.

Mr. MAYO. Yes, sir; \$160,000 per year for three years.

Mr. MILLER. The interest the Government will have to pay will be three years at the rate of \$800,000 a year, or \$2,400,000, will it not?

Mr. MAYO. You are making the same mistake as before.

Mr. MILLER. Plus the two years of the construction period, which will amount to just \$4,000,000 exactly. Now, during that three years you have paid a flat rate of interest of \$160,000 a year, or \$480,000. That is right, is it not? That is your flat rate period on Dam No. 3?

Mr. MAYO. Yes, sir; that is our flat-rate period.

Mr. MILLER. Now, deducting your \$480,000 from what the Government has paid in interest on its bonds there on the \$20,000,000 investment leaves a deficit on Dam No. 3 of \$3,520,000 that the Government has paid out in interest more than you have paid the Government under your contract.

Mr. MAYO. I think you have your interest too high during the construction period.

Mr. MILLER. I have figured on 4 per cent.

Mr. MAYO. I do not mean the percentage.

Mr. MILLER. You mean the period is too long?

Mr. MAYO. Yes, sir

Mr. MILLER. You have said in article 6 of your contract that you reserve the option to build Dam No. 3 after you have completed Dam No. 2, and if it takes one year, taking the shortest period, to build Dam No. 2 how can you build Dam No. 3 under a three-year period. You can not do it, can you?

Mr. MAYO. No, sir.

Mr. MILLER. Then the construction period on Dam No. 3 can in nowise be less than two years. Is not that right?

Mr. MAYO. I agree to that.

Mr. MILLER. Then on Dam No. 3 the Government will have paid out \$3,520,000 more than you have paid in.

Mr. MAYO. I do not think so.

Mr. MILLER. Then I would like to know wherein that is wrong. You have agreed with me all the way down to the total.

Mr. MAYO. Will you repeat, please, in regard to the time?

Mr. MILLER. Two years for the construction period for Dam No. 3, wherein the Government is bearing an interest charge of 4 per cent on \$20,000,000, or \$800,000 a year.

Mr. MAYO. Are you not taking the interest for the whole 3-year period on Dam No. 3?

Mr. MILLER. No; I am taking the interest for two years on Dam No. 3.

Mr. MAYO. We do not need all the money until we finish.

Mr. MILLER. But the Government will have to have this money to pay you because you are going to rush this work down there.

Mr. MAYO. I do not see the necessity of issuing the bonds only as we need the money.

Mr. MILLER. If you can find any living man on earth that will take a bond issue and deliver it in serial form at 4 per cent interest, you will discover something in finance that the rest of us have never heard of.

Mr. MAYO. I do not think so.

Mr. MILLER. With an interest rate less than the rate on Liberty bonds. Any man in the world would put his money in Liberty bonds, because he would get one-fourth of 1 per cent more than he would get from these bonds, even paying par for Liberty bonds. I do not see how you are going to do that, and what I am trying to get at is the proposition from the Government's angle.

Mr. MAYO. We think it can be done.

Mr. MILLER. I am figuring on a rate of 4 per cent and on the cost of Dam No. 3 at \$20,000,000.

Mr. MAYO. I think you should cut the construction period charge in two.

Mr. MILLER. If you can show me or show anybody how you can complete Dam No. 3 under two years I would like to hear it.

Mr. MAYO. No; but if we take the money as we use it, that interest rate will only amount to about one-half.

Mr. MILLER. You understand that the Government will have to finance this thing from a bond issue, because we can not go out and get any more money for this from the taxpayers, and we are figuring on its costing \$50,000,000.

Mr. MAYO. Yes, sir.

Mr. MILLER. And it would not be good propaganda for this company to do that.

Mr. MAYO. But it can be issued in blocks.

Mr. MILLER. That is what I have said. I do not believe you can find anybody that will take a bond issue in blocks and make partial deliveries at 4 per cent interest.

Mr. MAYO. I do not think that is anything new.

Mr. MILLER. It would be less than Liberty bonds pay, and any company would rather put its money in Liberty bonds, because they would get from one-fourth to one-half per cent more than the Government would be paying on these bonds, even if they paid par for Liberty bonds.

Mr. MAYO. I am not a financier.

Mr. MILLER. I am not either; but I know a little something about the money market, but not very much. I wish I knew more. Figuring on the basis I have figured, the Government will have paid out in interest \$3,520,000 more than you have paid them, and the only discrepancy you can find in that statement is that the construction period is a little too long.

Mr. MAYO. The interest during construction is about double what it should be.

Mr. MILLER. Suppose we take that off; that will only decrease it \$400,000 a year, or \$800,000.

Mr. MAYO. That is about correct; yes, sir.

Mr. MILLER. That will be \$3,500,000; and deduct from that \$800,000, assuming you can complete Dam No. 3 in one year, the Government in that case would be out \$2,720,000.

Mr. MAYO. All right, sir.

Mr. MILLER. Now, add that to the \$5,200,000 that we are out on Dam No. 2, and that would make a total of approximately \$8,000,000 that the Government would be out before you reach that period under your contract when you begin to pay the flat rate of 4 per cent.

Mr. MAYO. The Government is going to spend that much, but they will not be out that amount.

Mr. MILLER. The Government will have paid that in interest on its bonds, will it not?

Mr. MAYO. Yes, sir.

Mr. MILLER. It will have paid \$8,000,000 interest on its bonds over and above what your company will have paid the Government; that is money out of the United States Treasury, and that is the way I analyze your contract.

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, at the end of the six-year period on Dam No. 2 and at the end of the three-year period on Dam No. 3 you begin to pay the flat rate of 4 per cent on the cost of construction; that is right, is it not?

Mr. MAYO. Yes, sir; on the cost of the work we have constructed.

Mr. MILLER. And you do not begin to amortize the plant until three years after the plant is completed. You are not even doing anything on the amortization of the plant.

Mr. MAYO. That is right; yes, sir.

Mr. MILLER. Then up until three years after the dam is completed, you pay nothing on your amortization account and up until six years after the dam is completed, you pay a flat rate of interest of \$200,000 on Dam No. 2, and for a three-year period on Dam No. 3 you pay \$160,000. Then you pay nothing in the world, under the terms of your contract, so far as these dams are concerned, until at least one year after both dams are completed, and then the flat rate only, because your flat rate does not commence until a year after the dam is completed; that is right, is it not?

Mr. MAYO. We begin to pay interest when the amount of power is ready to serve, as stated here.

Mr. MILLER. You have fixed that at one year after the dam is completed before you pay anything?

Mr. MAYO. No; they are not wholly completed.

Mr. MILLER. I thought you said you were going to complete the dams in a year and you objected to my construction period being too long.

Mr. MAYO. Well, I did not say that. The dam itself will be completed, but the power house and its apparatus will not be.

Mr. MILLER. Anyway, your contract does not commence until the dam is completed, capable of generating 100,000 horsepower at Dam No. 2 and 80,000 horsepower at Dam No. 3.

Mr. MAYO. That is correct; and even then it is far from being finished.

Mr. MILLER. It may be far from being finished, but I understood you to say a moment ago that when 80,000 horsepower is generated at Dam No. 3 and 100,000 horsepower is generated at Dam No. 2, that the dams are practically completed.

Mr. MAYO. No, sir.

Mr. MILLER. I understood you to say so a little while ago, Mr. Mayo.

Mr. MAYO. I was mistaken if I did. The power-house machinery is a very expensive end of it.

Mr. MILLER. The Government has to buy that machinery, does it not?

Mr. MAYO. Exactly, but—

Mr. MILLER (Interposing). And it has to place all that machinery in position?

Mr. MAYO. But they do not have to pay for it until it is completed.

Mr. MILLER. That is all right. The Government will have to pay for its machinery probably the same as any other company would have to pay for it. The Government has to build these dams; it has to buy and install all of this machinery, turn it over ready for use; and even then, during the 100-year period, it has got to keep the dams in repair.

Mr. MAYO. I do not agree with you.

Mr. MILLER. Let us see about that.

Mr. MAYO. We pay a maintenance fund for them to keep it in repair.

Mr. MILLER. You pay \$35,000 a year on Dam No. 2 and \$20,000 a year on Dam No. 3.

Mr. MAYO. Yes, sir.

Mr. MILLER. And furnishing 300 horsepower to operate the gates.

Mr. MAYO. That is correct, 300 horsepower.

Mr. MILLER. Now, let us see if the Government is not to maintain these dams. Listen to this, Mr. Mayo, referring now to paragraph No. 4:

"The company will further pay to the United States, during the period of the lease of Dam No. 2, \$35,000 annually, in installments quarterly, in advance, for repairs, maintenance, and operation of Dam No. 2, its gates and locks, it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said 100-year lease period; and the company, at its own expense, will make all necessary renewals and repairs incident to efficient maintenance of the power house, substructures, superstructures, machinery, and appliances appurtenant to said power house, and will maintain the same in efficient operating condition."

You maintain the power house; now, let us see about the dams. I had that here a moment ago. Can you point me to that paragraph, Mr. Mayo?

Mr. MAYO. The paragraph which you read, No. 4, explains it fully, and is repeated again in paragraph 8 in reference to the other dam. The wording of both, however, is identical.

Mr. MILLER. Let us look at paragraph 8, which is the one that provides for the locks, etc., at Dam No. 3.

Mr. MAYO. No. 8 is identical with No. 4, with the exception that it applies to Dam No. 3.

Mr. WURZBACH. Look at the latter part of section 8.

Mr. MILLER. The latter part of section 8 refers to the power house of Dam No. 3. It is here some place.

Mr. WURZBACH. Is this what you refer to, "it being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States"?

Mr. MILLER. Where are you reading?

Mr. WURZBACH. From paragraph 8.

Mr. MILLER. "It being understood that all necessary repairs, maintenance, and operation thereof shall be under the direction, care, and responsibility of the United States during the said 100-year period." That means we are maintaining these dams for 100 years, Mr. Mayo.

Mr. MAYO. Maintaining it with our money.

Mr. MILLER. Maintaining it with your money?

Mr. MAYO. Yes, sir.

Mr. MILLER. How so? You pay \$35,000 a year, do you not?

Mr. MAYO. Yes, sir.

Mr. MILLER. You allot \$35,000 a year for the operation of the locks and maintenance of the dam.

Mr. MAYO. Yes, sir.

Mr. MILLER. Then the dam is to be maintained by the United States, and if maintained by the United States for \$35,000 a year plus the operation of the locks, we are even.

Mr. MAYO. Yes, sir.

Mr. MILLER. If the maintenance of the dam is over \$35,000 a year, together with the operation of the locks, the Government is out, is it not?

Mr. MAYO. Yes, sir.

Mr. MILLER. Then the Government maintains the locks and operates them, maintains the dam during the 100-year period, and all you are bound to pay is \$35,000 a year and furnish 200 horsepower.

Mr. MAYO. We are bound to the amounts we have stated on both dams and also the necessary amount to keep the power house and its apparatus properly maintained.

Mr. MILLER. During this construction period, when you do not pay anything, and during the six-year period of the flat payment of interest on Dam No. 2 and during the three-year period when you pay the flat rate of interest on Dam No. 3, all of this time you are getting 100,000 horsepower from the steam plant, are you not?

Mr. MAYO. It is there to get if we choose to use it.

Mr. MILLER. Yes.

Mr. MAYO. But it is a great deal more expensive power than the water power would be.

Mr. MILLER. That is the reason I was somewhat surprised yesterday when I asked you if the hydraulic electric energy at these dams was not the principal factor in your bid or the principal value of your contract with the Government.

Mr. MAYO. It is one of the principal factors.

Mr. MILLER. I can not see but what it is 90 and 9 per cent of the factors.

Mr. MAYO. That is your point of view.

Mr. MILLER. Now, let us take that angle for a moment. I do not want to tire you, Mr. Chairman.

The CHAIRMAN. You are not tiring me.

Mr. MILLER. Let us take up that angle a moment.

Mr. MAYO. You are not tiring me in the least, either.

Mr. MILLER. I am not tired, so we are all all right. Now, we will take up the hydroelectric power and let us analyze that a moment. You are getting 600,000 horsepower at Dam No. 2.

Mr. MAYO. When?

Mr. MILLER. When the dam is completed.

Mr. MAYO. When it is wholly completed; yes, sir.

Mr. MILLER. You get 250,000 horsepower at Dam No. 3.

Mr. MAYO. When it is wholly completed, we hope.

Mr. MILLER. You are getting 30,000 kilowatts from the Warrior steam plant, which is approximately 34,000 horsepower.

Mr. MAYO. Yes, sir.

Mr. MILLER. You are getting 60,000 kilowatts at the steam plant at nitrate plant No. 2.

Mr. MAYO. When we operate it.

Mr. MILLER. From my figuring that makes a total of 940,000 horsepower that those units will generate—that is simply a matter of calculation—when they are all running at maximum capacity, 940,000 horsepower or approximately 1,000,000 horsepower, the largest hydroelectric plant in the world, is it not?

Mr. MAYO. You are talking about a mixed plant of steam and water power.

Mr. MILLER. One hundred thousand of it is steam power, and the rest of it, 840,000 horsepower, or whatever it is, is from the hydraulic plant.

Mr. MAYO. And then the bulk of that is secondary power.

Mr. MILLER. We will come to that in a moment. That is the capacity of your dams, according to your own contract, 600,000 horsepower.

Mr. MAYO. That is the maximum capacity.

Mr. MILLER. Six hundred thousand horsepower at Dam No. 2, 250,000 horsepower at Dam No. 3, or 850,000 horsepower at the two dams.

Mr. MAYO. That is the maximum.

Mr. MILLER. And as I say, that is the largest hydroelectric plant in the world.

Mr. MAYO. One of them.

Mr. MILLER. Is it not larger than anything in the world at the present time.

Mr. MAYO. It is about the same as certain Niagara Falls plants I believe.

Mr. MILLER. That is, the aggregate of everything at Niagara Falls?

Mr. MAYO. No, sir; not the aggregate of everything.

Mr. MILLER. We have figured out 850,000 horsepower in your hydroelectric plant, 100,000 horsepower in your two steam plants, which will make 950,000 horsepower when all the units are running to maximum capacity. Now, out of your 600,000 horsepower at Dam No. 2 you are getting 100,000 primary power, are you not?

Mr. MAYO. Yes, sir.

Mr. MILLER. And you are getting 500,000 secondary power.

Mr. MAYO. Yes, sir; at times we are, but not all the time.

Mr. MILLER. But you are figuring on 100,000 primary horsepower.

Mr. MAYO. Yes, sir.

Mr. MILLER. Then there must be 500,000 secondary horsepower.

Mr. MAYO. Certainly, which is only a small part of the time.

Mr. MILLER. You are also figuring on 40,000 primary horsepower at Dam No. 3?

Mr. MAYO. Yes, sir.

Mr. MILLER. And you are figuring, of course, on 30,000 primary horsepower at your Warrior steam plant.

Mr. MAYO. Yes, sir.

Mr. MILLER. And you are figuring on at least 60,000 horsepower from the steam plant at nitrate plant No. 2.

Mr. MAYO. Yes, sir.

Mr. MILLER. When running to capacity, that makes a total of 230,000 primary horsepower that you have available.

Mr. MAYO. Yes, sir; at least that.

Mr. MILLER. One hundred thousand of which is available all during this period of construction of the dams, and all during the period of the six-year flat payment of interest period on Dam No. 2 and the three-year period of flat rate of interest on Dam No. 3.

Mr. MAYO. But it is not of any particular value during that period.

Mr. MILLER. But it is available if you want it?

Mr. MAYO. Yes, sir.

Mr. MILLER. Now, that will leave a surplus of 210,000 horsepower at Dam No. 3, will it not?

Mr. MAYO. I do not follow you.

Mr. MILLER. If Dam No. 3 will generate 250,000 horsepower and 40,000 of it is primary, there must be 210,000 of it secondary?

Mr. MAYO. Yes, sir.

Mr. MILLER. Adding the secondary power of Dam No. 2 to Dam No. 3, you have 710,000 secondary horsepower?

Mr. MAYO. Yes, sir.

Mr. MILLER. And you have got 230,000 primary horsepower. We will figure on that as a basis for a moment. Eighteen dollars per horsepower for primary power would be a cheap rate, would it not?

Mr. MAYO. Eighteen dollars a horsepower?

Mr. MILLER. Per annum.

Mr. MAYO. For the primary power?

Mr. MILLER. Yes.

Mr. MAYO. It would be a reasonable rate.

Mr. MILLER. Would it not be a very low rate?

Mr. MAYO. Not a very low rate.

Mr. MILLER. What rate does the Alabama Power Co. get for primary horsepower?

Mr. MAYO. I do not know.

Mr. MILLER. You have not made any inquiry?

Mr. MAYO. No.

Mr. MILLER. What rate have you figured on primary power in financing this plant?

Mr. MAYO. I do not remember.

Mr. MILLER. You have figured it on a very low rate, have you not?

Mr. MAYO. Quite a low rate; yes, sir.

Mr. MILLER. And you say \$18 is a very low rate for primary horsepower?

Mr. MAYO. I do not say it is a very low rate. I say it is a reasonable rate.

Mr. MILLER. Then 230,000 horsepower at \$18 per annum per horsepower would amount to \$4,140,000 a year. That would be your income from your primary power based upon \$18 per horsepower per annum, less your overhead for maintaining the power?

Mr. MAYO. For what period?

Mr. MILLER. For one year.

Mr. MAYO. You mean when we first start up?

Mr. MILLER. I mean when you get 230,000 horsepower, which we have seen is your primary power, and when all these units are in operation. That power is worth \$18 per horsepower per year, and your income therefore from your primary power will be \$4,140,000 a year. It is simply a matter of mathematical computation.

Mr. MAYO. It is much more involved than mere multiplication. You can not take it on the basis of what we might sell it for. It is simply a part of our cost in whatever we manufacture.

Mr. MILLER. Yes; it is a part of your cost, and \$18 per horsepower is a reasonable price for it, you said.

Mr. MAYO. It is a reasonable rate to sell power about the country where there is a market for it; yes.

Mr. MILLER. I believe there was some evidence introduced here that the rate of the Alabama Power Co. down there was 3 mills per kilowatt-hour.

Mr. MAYO. Yes, sir.

Mr. MILLER. Three mills per kilowatt hour, running 24 hours a day would be at the rate of over \$21 per annum per horsepower, would it not?

Mr. MAYO. It is a little under \$20.

Mr. MILLER. A little under \$20.

Mr. MAYO. I think so.

Mr. MILLER. Three mills for 24 hours a day would be 72 mills per day, figure that for 300 days in a year, and see what you get.

Mr. MAYO. Nineteen dollars and sixty-one cents.

Mr. MILLER. Well, that is higher than I have put it. Now, take your 710,000 secondary power.

Mr. MAYO. But you are predicating all your statements on the basis of our selling this power, which is not the fact.

Mr. MILLER. I am basing this upon your utilizing the capacity of your plant there for yourself or selling it; that is, using it, what you want, and selling the balance, and I am putting it at a very low rate both for consumption and for sale, lower than the Alabama Power Co. is getting to-day, because 3 mills, according to your figures, amount to \$19.61 per horsepower per annum.

Now, we will take up the secondary power. Suppose you only get \$6 per year per horsepower, you have an income from that of \$4,260,000, and adding your primary and secondary power—

Mr. MAYO (interposing). An income from where?

Mr. MILLER. From your secondary power, Mr. Mayo, which amounts to 710,000 horsepower, according to what you told me a moment ago.

Mr. MAYO. There is no market for that there at present.

Mr. MILLER. Do you not intend to use your secondary power?

Mr. MAYO. As soon as we can build up to it.

Mr. MILLER. Absolutely, you are going to use it.

Mr. MAYO. It is going to take a great length of time to do it.

Mr. MILLER. And you will charge your various enterprises which you establish with power at a certain price, will you not?

Mr. MAYO. At a certain price; yes, sir.

Mr. MILLER. You will have to do that in order to ascertain the cost of your fertilizer.

Mr. MAYO. Exactly.

Mr. MILLER. And you will therefore use your secondary power, all that you can use, and what you can not use you will sell, of course; and you are capable of generating 710,000 horsepower.

Mr. MAYO. Yes, sir; but not 710,000 salable horsepower.

Mr. MILLER. Now, suppose we put that at a rate of \$6 per horsepower per year; the way I figure it you get a revenue of \$4,260,000 a year, which added to the revenue from your primary power will make a total of \$8,400,000 a year from the total horsepower, less your overhead.

Mr. MAYO. What period are you figuring on?

Mr. MILLER. A year.

Mr. MAYO. But we do not get it all the year. The secondary power varies in accordance with the flow.

Mr. MILLER. Of course, it varies; otherwise it would be primary power.

Mr. MAYO. Exactly.

Mr. MILLER. So I am putting it down at just one-third of what you get for your primary power.

Mr. MAYO. While that may be true, you are not reducing the quantity. You do not get that total quantity the year round.

Mr. MILLER. No; because if you did it would be primary power and would be three times as high. I am putting it at one-third of what you get for your primary power.

Mr. MAYO. It should not only be at a much lower rate, but on a much less quantity.

Mr. MILLER. And I am putting it at one-third of what your primary power is worth.

Mr. MAYO. I do not think it should be over one-third.

Mr. MILLER. I do not, either, and I am putting it at one-third.

Mr. MAYO. But even at that you are wrong as to the quantity.

Mr. MILLER. Seven hundred and ten thousand horsepower?

Mr. MAYO. Yes; but it is not constant. It varies all the while.

Mr. MILLER. I understand that. If it was constant it would be primary power.

Mr. MAYO. If you would switch around and say one-third of the power at \$6—

Mr. MILLER (interposing). I am putting down your secondary power at about one-third the price of your primary power.

Mr. MAYO. Per unit cost.

Mr. MILLER. Yes.

Mr. MAYO. Then we do not get the quantity.

Mr. MILLER. You get 710,000 secondary power.

Mr. MAYO. Only for a very short period. The maximum power might be a month's duration.

Mr. MILLER. You may get your primary power to full capacity for certain months in the year.

Mr. MAYO. It may be for a month.

Mr. MILLER. You may get 850,000 horsepower out of those two dams for two or three or four months in the year; that is right, is it not?

Mr. MAYO. But you are basing your argument on the whole year, are you not?

Mr. MILLER. I am basing my argument on exactly the definition of secondary power and primary power that you have given. If dam No. 3 will produce 250,000 horsepower and 40,000 of that is primary power, there must be 210,000 of it secondary power; that is right, is it not?

Mr. MAYO. It seems to me you are mixed all the while in the quantity of your secondary power.

Mr. MILLER. I would like to have you unravel it, if I am wrong about it.

Mr. MAYO. You are taking the maximum amount of secondary power and you are figuring that on a full year's basis.

Mr. MILLER. I am taking your maximum secondary power and figuring it at one-third of your primary power.

Mr. MAYO. But you are figuring it on the basis of that many horsepower-years.

Mr. MILLER. Yes.

Mr. MAYO. Which is wrong.

Mr. MILLER. You use your primary power at certain seasons of the year.

Mr. MAYO. All the year.

Mr. MILLER. I mean you use your secondary power at certain seasons of the year.

Mr. MAYO. Yes, sir; when we can.

Mr. MILLER. Now, there are certain seasons of the year in which you will have a large amount of secondary power, depending upon the flow of the water.

Mr. MAYO. Yes, sir.

Mr. MILLER. At certain seasons of the year you will have the full capacity of 850,000 horsepower.

Mr. MAYO. Yes, sir; but you are basing your figures at \$6 per horsepower-year on the total maximum amount for the entire year.

Mr. MILLER. On the secondary power.

Mr. MAYO. Exactly; but your figures are on the horsepower-yearly basis.

Mr. MILLER. How would you figure it? You say I am wrong; I would like to know how you figure the value of your secondary power.

Mr. MAYO. I would divide the maximum quantity in thirds, approximately, and then take the price of about one-third of that.

Mr. MILLER. Well, taking 710,000 horsepower, which is the amount of secondary power, one-third of that would be 240,000 horsepower.

Mr. MAYO. Yes, sir.

Mr. MILLER. What price do you sell that secondary power for?

Mr. MAYO. We are not selling it.

Mr. MILLER. What price will you charge your various enterprises?

Mr. MAYO. Probably the cost.

Mr. MILLER. What will it cost? You have certainly figured this out in making the proposition.

Mr. MAYO. Yes, sir.

Mr. MILLER. How have you figured it?

Mr. MAYO. I do not remember just what our figures are.

Mr. MILLER. Well, what would you figure it to be worth—\$6?

Mr. MAYO. The \$6 would be a reasonable price.

Mr. MILLER. Now, we are putting that, according to the lowest possible thing we can make it, at one-third, and figuring it at \$6, that makes an income of \$1,440,000 a year from your secondary power and you are paying \$1,200,000 a year to the Government. You will get \$200,000 more out of your secondary power than you pay in interest to the United States Government during the 100 years of your lease.

Mr. MAYO. I do not agree with you.

Mr. MILLER. Wherein am I wrong?

Mr. MAYO. If we charge the power in as a part of the cost of our material the amount we get for the power is what it costs.

Mr. MILLER. You will certainly do that, will you not, Mr. Mayo?

Mr. MAYO. Yes, sir.

Mr. MILLER. You certainly will. Mr. Ford does that in his present plant; that is, charges up every dollar's worth of the maintenance of the power plant as a part of the overhead of the production.

Mr. MAYO. Exactly; but that goes in as its cost, not at what he could sell it for.

Mr. MILLER. And we are figuring according to your own figures, \$6 and one third of the output.

Mr. MAYO. They are not my own figures. It is only what I stated was a reasonable figure.

Mr. MILLER. Well, I am taking your reasonable figure, and you will sell \$1,440,000 worth of secondary horsepower, which, added to your \$4,140,000 for your primary horsepower, makes \$5,580,000 worth of hydraulic power that will be produced annually, and the only thing to be taken out of that is the overhead, the cost of the production, which will be considerable in your two steam plants, but very, very little in your two hydraulic plants.

Mr. MAYO. One of the prime reasons for being able to make cheap fertilizer is to get cheap power that you can put into it at practically cost.

Mr. MILLER. Incidentally, when you get cheap power for making fertilizer, you get cheap power for all the enterprises the company intends to establish there.

Mr. MAYO. We get the same benefit.

Mr. MILLER. And that is the reason I am still surprised that you do not say the power generated there is the great inducement for you to make this offer.

Mr. MAYO. That depends on the load factor that we can build up.

Mr. MILLER. I believe that is all, and I perhaps should apologize, but I understand every angle of this contract, I believe, now, and I know you do, and that is the reason I asked you from time to time wherein I was wrong, if I was wrong.

Mr. MAYO. The Government invited Mr. Ford to make this offer and he has made the best offer he figures he cares to make. He has tried to make it as fair as he knows how, and you will have to take it or leave it, at its face value.

Mr. MILLER. But this is the way the thing comes to us: Mr. Ford has made this offer. It is now up to the United States Government to accept it or to reject it.

Mr. MAYO. Yes, sir.

Mr. MILLER. And in order for Congress to have an intelligent opinion of this thing, and to intelligently pass upon it, this detailed information about which I have asked you will have to be laid before the House.

Mr. MAYO. Yes, sir.

Mr. MILLER. And I want to lay it before the House exactly as I understand it, and as I have said, I believe I understand now every angle of the contract, and I know you do.

Mr. MAYO. We are here to offer any explanation we can on our part.

Mr. PARKER. Mr. Mayo, you say that that power was reckoned when you were making up the basis for this offer at some figure, but you do not remember exactly what it was?

Mr. MAYO. No, sir.

Mr. PARKER. Can you not remember something about what it was, whether it was over one price or over another?

Mr. MAYO. We figured this proposition out as a whole, a combination of the dam project and the nitrate plant—the whole property.

Mr. PARKER. As to the power, you say Mr. Ford also charges power to his various plants; at what rate does he charge power?

Mr. MAYO. At cost.

Mr. PARKER. How much?

Mr. MAYO. Whatever the cost may be.

Mr. PARKER. What is it, generally?

Mr. MAYO. I have not figured the yearly rate.

Mr. PARKER. I do not want you to figure the yearly rate; I want you to tell me what you recall was the cost of power that he charged, about. Have you seen his books?

Mr. MAYO. He does not charge the horsepower up as such, but all the elements that go into making it are charged into the cost of his product.

Mr. PARKER. And at about what rate is it charged?

Mr. MAYO. There is no rate charged at all.

Mr. PARKER. What rate would the charges make? You have figured that up.

Mr. MAYO. I beg your pardon.

Mr. PARKER. What rate would the various charges that are made make; what rate per year per horsepower?

Mr. MAYO. I presume they would run around \$20.

Mr. PARKER. In figuring secondary horsepower you said \$6 would be a reasonable rate for one-third of it.

Mr. MAYO. Yes.

Mr. PARKER. Yes; I think it would be. How much did you figure it out when you were figuring up this contract?

Mr. MAYO. I do not remember, sir.

Mr. PARKER. You do not remember? Was it more than \$6?

Mr. MAYO. I do not know.

Mr. PARKER. Would \$8 be a reasonable rate?

Mr. MAYO. I have stated before that \$6 was a reasonable rate.

Mr. PARKER. Would \$8 be a reasonable rate?

Mr. MAYO. I think so.

Mr. PARKER. Would \$10 be a reasonable rate?

Mr. MAYO. No, sir; I would not think so.

Mr. PARKER. Would \$9 be a reasonable rate?

Mr. MAYO. Fairly so.

Mr. PARKER. Some of this secondary power runs for eight months in the year; a good part of it?

Mr. MAYO. Not a good part of it, I would say.

Mr. PARKER. Half of it?

Mr. MAYO. No, sir; maybe one-third of it, or less.

Mr. PARKER. For the one-third running eight months in the year, what is a reasonable rate for that power?

Mr. MAYO. I would say \$6 or \$7.

Mr. PARKER. For the whole of it or for a part of it.

Mr. MAYO. For that one-third for the eight-month period.

Mr. PARKER. For the one-third that runs for eight months, you would reckon \$6 or \$7.

Mr. MAYO. Yes, sir.

Mr. PARKER. Does another one-third run of six months?

Mr. MAYO. I would not think so; maybe for four months.

Mr. PARKER. One-third more would run for four months, and what rate would you charge on that or allow on that for the time it ran?

Mr. MAYO. That leads into a rather complicated question. You must have a lot of spare apparatus in order to use your maximum power when it is available. The amount of power you can deliver is not the amount you could generate.

Mr. PARKER. That is not an answer to my question, but I will not ask it any more if you do not want to answer it. Mr. Mayo, I understand that a kilowatt is reduced to horsepower by dividing by seven-tenths.

Mr. MAYO. By 0.746.

Mr. PARKER. If you divide 90,000 kilowatts by 0.746 how many horsepower do you get?

Mr. MAYO. Approximately one-third more.

Mr. PARKER. So that the 90,000 kilowatts would become 120,000 horsepower.

Mr. MAYO. Yes, sir.

Mr. PARKER. And not 100,000, as Mr. Miller reckoned, but 120,000 horsepower.

Mr. MAYO. Yes, sir.

Mr. PARKER. I would now like to ask you about another matter. A good part of this property Mr. Ford insists upon taking in fee.

Mr. MAYO. Yes, sir.

Mr. PARKER. For what reason?

Mr. MAYO. Because he wants to own it outright.

Mr. PARKER. For what purpose?

Mr. MAYO. For manufacturing purposes.

Mr. PARKER. Does he mean to mortgage it?

Mr. MAYO. I do not know.

Mr. PARKER. He could mortgage it, could he not?

Mr. MAYO. I presume he could.

Mr. PARKER. To use for manufacturing purposes a lease would be just as good as a deed, would it not, as far as the use is concerned?

Mr. MAYO. I think not.

Mr. PARKER. Why not?

Mr. MAYO. Because you would not want to make a large investment on leased property.

Mr. PARKER. Even if it was leased for 100 years, and although manufacturing property does not last over 20 or 30 years as a rule, and has to be renewed every 30 years.

Mr. MAYO. It is not all renewed, but is generally greatly changed.

Mr. PARKER. What security does the United States have on plant No. 2 outside of Mr. Ford's personal agreement?

Mr. MAYO. They have the value of the plant. That is always there.

Mr. PARKER. The value of the plant belongs to Mr. Ford after it is deeded to him.

Mr. MAYO. Yes, sir.

Mr. PARKER. He has it all.

Mr. MAYO. Yes, sir.

Mr. PARKER. He could convey it to somebody else.

Mr. MAYO. Yes, sir.

Mr. PARKER. There is nothing in the contract to prevent him conveying it to somebody else?

Mr. MAYO. I think he can only do it in accordance with the conditions of this offer.

Mr. PARKER. But he is given a full title.

Mr. MAYO. Yes, sir.

Mr. PARKER. What is to prevent his mortgaging?

Mr. MAYO. There are some restrictions on the title.

Mr. PARKER. Is there any restriction on his mortgaging?

Mr. MAYO. I do not think so.

Mr. PARKER. And the mortgagee would take the property, if there was a sale, leaving the Government only the company's responsibility, whatever it might be, if this was after Mr. Ford's death, say 50 years from now.

Mr. MAYO. I think that is possible.

Mr. PARKER. That is to say, if in 50 years from now the company had mortgaged and failed and had been foreclosed, all the Government's plants would be gone and nobody would be manufacturing, and the Government would have no security whatever?

Mr. MAYO. Well, I am not a lawyer, but I am of the opinion that if there was a mortgage placed on that property it would be placed with all the conditions of this offer attached.

Mr. PARKER. Will you be ready to put that in the contract, that the deed to plant No. 2 and to this property should be subject to the conditions of this contract?

Mr. MAYO. I think that would follow whether we said so or not.

Mr. PARKER. Would you be willing to put that in the contract expressly, because I do not think, as a lawyer, it does follow?

Mr. MAYO. I do not know.

Mr. PARKER. I want to make it plain, and I say, as a lawyer, that I doubt that very much, and I wanted to know whether you were willing to have the deed made subject to the conditions of this contract?

Mr. MAYO. I could not say definitely, but I am of the opinion Mr. Ford would be willing to do anything to properly protect the Government.

Mr. PARKER. Do you think he would be willing to do that?

Mr. MAYO. I think so.

Mr. PARKER. So if we insisted that that should be done you think he would not object?

Mr. MAYO. I do not think he would.

Mr. PARKER. What are the other ingredients of fertilizer, except the ammonium sulphate? You have studied this matter out.

Mr. MAYO. Phosphates and potashes.

Mr. PARKER. Where would you get the phosphates and potashes?

Mr. MAYO. The phosphate in the immediate neighborhood there.

Mr. PARKER. The phosphates are near there?

Mr. MAYO. Yes, sir.

Mr. PARKER. Where are they?

Mr. MAYO. Within a radius of 100 miles.

Mr. PARKER. Where?

Mr. MAYO. Well, one place is near Columbia, Tenn.

Mr. PARKER. Are they mineral phosphates?

Mr. MAYO. Yes, sir; rock phosphates.

Mr. PARKER. What are the other things that go into it?

Mr. MAYO. Potashes.

Mr. PARKER. Where would the potash come from?

Mr. MAYO. I could not say at present.

Mr. PARKER. What do you mean by "could not say"; has not potash been a very troublesome thing to get?

Mr. MAYO. Yes, sir.

Mr. PARKER. It comes mainly from Germany, does it not?

Mr. MAYO. A great deal; yes sir. We have a number of processes from which we think we can get a reasonable amount.

Mr. PARKER. And factories located near New York or along the shore have an advantage in freight rates in importing German potash, have they not?

Mr. MAYO. Potash could be brought there by water.

Mr. PARKER. Could be brought where?

Mr. MAYO. Could be brought to Muscle Shoals by water.

Mr. PARKER. I understand that, but is that a cheap way of getting it, coming up the Mississippi and the Ohio and the Tennessee?

Mr. MAYO. I think it would be the cheapest way.

Mr. PARKER. But is it as cheap as bringing it direct to the shore?

Mr. MAYO. It would not be as cheap as landing it at New Orleans.

Mr. PARKER. But is there not a great deal of difference in the freight in getting potash from Germany to this place and getting it, say, at New York or at same place near New York?

Mr. MAYO. There would be some difference; I do not know just what.

Mr. PARKER. Do you know how much it would be?

Mr. MAYO. No, sir. It does not necessarily have to come from Germany.

Mr. WURZBACH. Mr. Mayo, is there any present demand for as much as 900,000 horsepower at Muscle Shoals?

Mr. MAYO. No, sir.

Mr. WURZBACH. The value of power would depend upon the demand for it?

Mr. MAYO. To a great extent; yes, sir.

Mr. WURZBACH. What would you say would be the present value of primary horsepower at this present dam; I mean at Muscle Shoals; would it have any value at all?

Mr. MAYO. It would not have any value until you had built distributing lines to take it to where it could be used.

Mr. WURZBACH. What demand is there within 200 miles of Muscle Shoals at the present time?

Mr. MAYO. As a whole, I do not imagine there is a demand for possibly over one-third of it.

Mr. WURZBACH. What is necessary to be done in order to give the horsepower any value—that is, the value stated here at these hearings of \$18 for primary horsepower and \$6 for secondary horsepower?

Mr. MAYO. You would have to make a very large investment in a manufacturing plant there to use all the power, and then get a sufficient price for your product.

Mr. WURZBACH. It would depend upon a considerable investment in that neighborhood, would it not?

Mr. MAYO. Yes, sir.

Mr. WURZBACH. About what investment would be necessary, do you think, to utilize the full 900,000 horsepower, which includes the primary and the secondary power?

Mr. MAYO. In a manufacturing plant?

Mr. WURZBACH. Yes.

Mr. MAYO. I am of the opinion it will take in excess of \$50,000,000.

Mr. WURZBACH. In excess of \$50,000,000?

Mr. MAYO. Yes, sir.

Mr. WURZBACH. And I understand that that is what Mr. Ford proposes to do.

Mr. MAYO. That is Mr. Ford's intention; yes, sir.

Mr. WURZBACH. To expend about \$50,000,000 in that neighborhood for the purpose of utilizing the water power that is available by these two dams.

Mr. MAYO. It is his intention to spend what is necessary to develop that plant as quickly as possible to use all the power.

Mr. WURZBACH. At the present time it has merely a potential value and has no actual value.

Mr. MAYO. I would say not until it is developed.

Mr. FIELDS. Mr. Mayo, I do not know anything about the production of power or its cost and shall not attempt to question you upon that point except

to try to get clear in my own mind Mr. Miller's figures. He figures primary horsepower at a value of \$18 and secondary horsepower at the value of \$6, I believe. Upon that value he calculates the total income to the proposed Ford company. It seems to me, however, he has overlooked the cost of the production of that power. If this primary horsepower is worth \$18 per horsepower per annum, as he figures, and it cost 66 $\frac{2}{3}$ per cent of that to produce it for overhead and operation, that amount reduces the total income to the company to one-third of the \$18, does it not, using those figures as an illustration?

Mr. MAYO. Yes. I think Mr. Miller was just getting at the amount of the gross income.

Mr. FIELDS. But was making no allowance—and up to this time no allowance has been made—for the cost of production of that horsepower, which might be misleading to some people not familiar with the subject.

Mr. MAYO. Yes, sir.

Mr. FIELDS. Therefore the amount derived from the sale of this power, which he has figured out, will not all be clear profit to the Ford company if it should be sold at that figure?

Mr. MAYO. Certainly not; and it would all be dependent on our success in making it at a cost which would allow us to sell the product at a profit.

Mr. FIELDS. It seems to me he was basing his figures, too, upon a 100 per cent load factor. Is it not a fact that about the average load factor throughout the country is about 51 per cent?

Mr. MAYO. About that; yes, sir. That, according to the record, is the approximate load factor of the Alabama Power Co.

Mr. FIELDS. That would decrease the value to the company, or the return to the company, upon his figures very materially?

Mr. MAYO. It would cut it in two.

Mr. FIELDS. Is it your plan to charge the various industries to be supplied by this power with power at actual cost? I believe you stated that was Mr. Ford's plan, generally speaking.

Mr. MAYO. I think that would be the plan—that on all of the power that would go into the fertilizer we could not charge more than 8 per cent profit.

Mr. FIELDS. I want to refer now to the fertilizer. A good many questions were asked yesterday as to whether or not the Government has any assurance that Mr. Ford would continue the production of fertilizer. The first assurance is his agreement in his contract to do so, and the second assurance is the agreement to produce at least 110,000 tons of ammonium nitrate, for which he must find a market.

Mr. MAYO. Yes.

Mr. FIELDS. Where could he market that or how could he market it other than as a fertilizer product?

Mr. MAYO. His object is to make a complete fertilizer. The plant was built to make ammonium nitrate, which is not used usually as a fertilizer ingredient. It would have to be changed over to make ammonium sulphate, or something else.

Mr. FIELDS. In the production of these products he binds himself, and he must find a market for them.

Mr. MAYO. Yes, sir.

Mr. FIELDS. He is not going to produce that product and throw it into the river, or do anything like that?

Mr. MAYO. No, sir.

Mr. FIELDS. I believe there are three elements which contain plant food in the composition of the fertilizer.

Mr. MAYO. Yes, sir.

Mr. FIELDS. By producing nitrate at Dam No. 2, and by getting the phosphoric acid from the mineral deposits within 100 miles of the plant, you get two of the fertilizer ingredients at the plant or at a point in close proximity to the plant.

Mr. MAYO. Yes, sir.

Mr. FIELDS. Leaving only the third ingredient to be acquired at other places? Mr. MAYO. We are working at several processes which look as though we would be able to make some potash on the ground.

Mr. FIELDS. So there is the possibility that you will be able to get two of those ingredients on the ground?

Mr. MAYO. Yes, sir; we may be able to produce all three of them there.

Mr. FIELDS. If you are not able to do that, potash is the only ingredient that you will have to get somewhere else?

Mr. MAYO. Yes, sir.

Mr. FIELDS. I know there are many formulæ for the making of fertilizer, but taking the average standard, about what per cent of that is potash?

Mr. MAYO. About 2 per cent.

Mr. FIELDS. Therefore, the great bulk of it will be gotten at the plant, or in the phosphorous fields of that region?

Mr. MAYO. Yes, sir.

Mr. FIELDS. With this condition do you have any fear that Mr. Ford may not be able to produce fertilizer as cheaply as it is produced by any other concern in the country?

Mr. MAYO. My opinion is that it will not cost more than half.

Mr. FIELDS. So long as he is not producing it as cheaply as it can be produced by any other firm in the country he can, of course, produce it at a profit, and could not get away from his contract to produce fertilizer?

Mr. MAYO. No, sir.

Mr. FIELDS. If he produces it at one-half the cost at which it can be produced by other concerns, that is so much better for the consumer of the fertilizer, is it not?

Mr. MAYO. Yes, sir.

Mr. FIELDS. In the average fertilizer compound, about what per cent of it is plant foods and what per cent is filler?

Mr. MAYO. About 12 or 14 per cent is plant food.

Mr. FIELDS. Then in transporting this fertilizer over the country on long hauls the large per cent of the transportation charges are for filler?

Mr. MAYO. Yes, sir; 86 to 88 per cent is filler.

Mr. FIELDS. Have you considered the possibility of constructing mixing plants at various distributing centers and shipping to those mixing plants the plant foods that go into the fertilizer and securing the filler, the heavier part of it, at or near the distributing plants to save the freight charges on the long hauls of that very heavy part of the product?

Mr. MAYO. Our hope is to make it with little or no filler at all and deliver it direct to the farmer, he to mix it himself with his own filler.

Mr. FIELDS. That would result in a very material saving to the farmer, would it not?

Mr. MAYO. Yes, sir.

Mr. FIELDS. If this personal reference may be pardoned, I have one character of soil that requires only phosphoric acid, and I purchased last year fertilizer containing 16 per cent of phosphoric acid and 84 per cent of filler, which appeared to be white sand or something of that kind, for which I paid \$52 a ton, and I thought when purchasing that that if there were a workable plan by the use of which I would only have to pay the long freight charges on the 16 per cent of phosphoric acid and get this sand in my own country, of which I had plenty myself, that that would be quite a big saving to me.

Mr. MAYO. Mr. Ford hopes to make a great economic saving in that way.

Mr. FIELDS. In the production of the fertilizer contemplated by Mr. Ford is it possible that any by-product would come from it?

Mr. MAYO. From the making of the fertilizer?

Mr. FIELDS. Yes, sir.

Mr. MAYO. We hope so; yes, sir.

Mr. FIELDS. Would the value of those by-products have any bearing upon the cost of the fertilizer?

Mr. MAYO. They would surely be credited to the fertilizer; yes, sir.

Mr. FIELDS. Adding that much more to the cheapening of the product?

Mr. MAYO. Yes, sir.

Mr. FIELDS. Mr. Mayo, what agricultural implements are now manufactured by Mr. Ford?

Mr. MAYO. Only the farm tractor, unless the automobile may be considered as a farming implement.

Mr. FIELDS. And the truck is used by the farmer very extensively now as a cheaper means of transportation?

Mr. MAYO. Yes.

Mr. FIELDS. Would the cheaper power, such as you hope to get at Muscle Shoals, enter into the cost of the production of these implements, should they be manufactured there, or the parts of which they are constructed be manufactured there?

Mr. MAYO. Yes; or the raw materials of which the parts are made.

Mr. FIELDS. Would you feel disposed to make any statement as to Mr. Ford's intention or desire in reference to meeting the needs of the agricultural interests

of the country in the production of fertilizer and the manufacture of farm implements, including trucks, etc.?

Mr. MAYO. Well, of course, it is Mr. Ford's dream, in regard to this fertilizer product, to make the price of it so low that everybody can use it in any quantity they wish to; that the expense would not prevent them from using all they should use. He also hopes that ultimately he can make his raw materials for his automobile trucks and tractors at a lower price and in that way help reduce the price of that commodity. It has been his dream for a long time to make the final combined price for the automobile, the truck, and the tractor at \$1,000. At present the price runs about \$1,200, so he is at the present time quite near his goal.

Mr. FIELDS. With regard to the tenure of the franchise, I believe the American Aluminum Co. has power plants in the upper Tennessee River, above Muscle Shoals, and that their franchise is in perpetuity.

Mr. MAYO. So I understand.

Mr. FIELDS. That is my understanding. Do you know of any good reason why the water-power right should be perpetual at the dams of that company and only be for 50 years at the proposed Ford Dam?

Mr. MAYO. I see no reason for that.

Mr. FIELDS. Do you care to express a positive opinion, Mr. Mayo, as to whether Mr. Ford would consider the Muscle Shoals proposition under a 50-year franchise?

Mr. MAYO. No, sir; Mr. Ford would not consider it.

Mr. HILL. Mr. Mayo, this question depends particularly on the duration of this franchise. Will you please turn to paragraph 17 of Mr. Ford's amended offer, at the top of page 18? That paragraph reads as follows:

"In order that said company may be supplied with electric power and the farmers with fertilizers after the termination of the said 100-year leases, should the United States elect not to operate said power plants but determine to lease or dispose of same, the company shall have the preferred right to negotiate with the United States for such lease or purchase and upon such terms as may then be agreed upon."

As I understand it, that means at the end of the 100-year period?

Mr. MAYO. Yes, sir.

Mr. HILL. And it is your opinion that Mr. Ford would not make this proposition except on a 100-year period basis?

Mr. MAYO. Yes, sir; that is correct.

Mr. HILL. Paragraph 17 continues:

"If the said leases are not renewed or the property covered thereby is not sold to said company, its successors or assigns, any operation or disposal thereof shall not deprive the company, its successors or assigns, of the right to be supplied with electric power at reasonable rates and in amount equal to its needs, but not in excess of the average amount used by it annually during the previous 10 years."

As I read that, it looks to me as if after the 100-year period, should this proposition be accepted, there is a perpetual right on the part of the company or its successors or assigns to be provided with an amount of power equal to its needs, not in excess of the average amount used by it annually during the previous 10 years. My construction is that beyond the 100-year period there is an absolutely perpetual, prior claim by this company on the United States Government to be furnished with that amount of power. What is your view on that?

Mr. MAYO. The thought in framing that paragraph was that we would have a very large investment built up around the dams, and it would not be fair to the company to take the power from under their feet and give it to some one else; that they should have a preferred claim, everything else being equal.

Mr. HILL. Now, then, that paragraph, according to Mr. Ford's intention, means that after the 100-year period, if it is not arranged that his interests or the successors of his company shall buy the property, he will have a perpetual right to get indefinitely and have a first lien on the power that is produced there, not to exceed the average amount used annually in the previous 10 years.

Mr. MAYO. He thought he ought to have it, everything else being equal.

Mr. HILL. That is a very unusual arrangement; it is one I had not noticed before. Here is the proposition which he puts up, as I understand it: It does not make any difference what the ultimate disposition is, his company has a perpetual first claim on the plant after the 100-year period; is that not right?

power rights on navigable streams. The Mississippi River Power Co. has one at Keokuk, Iowa; the Alabama Power Co. has one at Lock 12 on the Coosa River. There are a number of others. The idea is nothing new.

Mr. HILL. If you had used all the power you would have the right to all of the output?

Mr. MAYO. Yes, sir.

Mr. HILL. In other words, paragraph 17 proposes to the Government that the Government shall become a partner with this company in the creation of this great project; is that not right?

Mr. MAYO. Well, only in so far as a landlord would be a partner.

Mr. HILL. Under the contract, what is the maximum amount of money that the United States Government would be called upon to advance for the construction of Dams No. 1 and No. 2? As I see it, the contract is utterly silent on that. The contract, in paragraphs 2 and 6, provides that the company shall complete, without profit, Dams Nos. 2 and 3 at actual cost, but the United States shall put that money up.

Mr. MAYO. Yes, sir.

Mr. HILL. The Secretary of War, on page 4, says this: "The present estimates of the Engineer Department for the completion of both Dam No. 2 and Dam No. 3 is \$50,000,000. Engineers for Mr. Ford have presented a lower estimate, but Mr. Ford has not seen fit to guarantee the construction for this lower figure."

Mr. MAYO. Yes, sir; that is correct.

Mr. HILL. In your contract, as I understand it, you do not set any figure as a maximum for the amount to be advanced by the United States; is that correct?

Mr. MAYO. That is correct, but he pays interest on whatever it may cost.

Mr. HILL. But he pays interest at 4 per cent?

Mr. MAYO. Yes, sir.

Mr. HILL. It is quite conceivable that the cost might be \$50,000,000, is it not?

Mr. MAYO. We do not think so.

Mr. HILL. The Army Engineers estimate the cost at \$50,000,000.

Mr. MAYO. They did, but they think our estimate was also a fair one.

Mr. HILL. You do not guarantee that it will not cost \$50,000,000, do you?

Mr. MAYO. Neither do they.

Mr. HILL. They are not building it, but you are.

Mr. MAYO. We hope to.

Mr. HILL. We will assume for the purpose of this inquiry that you are. Assuming for the purpose of our discussion here that you are building this proposition. The Army Engineers have estimated it would cost \$50,000,000.

Mr. MAYO. Yes, sir.

Mr. HILL. Of course, we are looking at it from a good many angles. Personally, I am much interested in the fertilizer end of it, and I am also interested personally, very much, in the national defense end of it. But this is a very novel proposition for the United States Government. It has never signed a contract like this in its history.

Mr. MAYO. I do not think any individual ever made one either.

Mr. HILL. I do not think he did. Therefore, for the purpose of testing it we are asking these questions. The United States is called upon to advance a certain number of millions of dollars for the actual cost of No. 2 and No. 3 dams.

Mr. MAYO. Yes, sir.

Mr. HILL. Am I right in supposing that the contract does not limit that amount; it is the actual cost?

Mr. MAYO. That is right.

Mr. HILL. If engineering difficulties should suddenly develop the cost would be greater, would it not?

Mr. MAYO. Yes, sir.

Mr. HILL. If an earthquake or an extraordinary flood should destroy those dams, what would happen then? The United States is bound to keep on advancing money; that is, the necessary amount, is it not?

Mr. MAYO. Yes, sir.

Mr. HILL. Because those are what are known as acts of God, and are not included in the contract.

Mr. MAYO. That is correct.

Mr. HILL. Therefore, the United States is obliged to advance an indefinite sum at 4 per cent?

Mr. MAYO. Yes, sir.

Mr. HILL. And the money that they so advanced makes a project on which the proposed company has a prior perpetual lien on all the output; is that not right?

Mr. MAYO. Yes, sir; within the limitations stated.

Mr. QUIN. Mr. Mayo, every kind of assumption has been indulged in since this proposition has been submitted, except the second coming of the Savior at the end of the world. If Mr. Ford, through this generous offer to the people of the United States, can bring forth all of these violent assumptions I have an idea that these gentlemen think he can bring down the cost of fertilizer to the farmers of the country.

Are you familiar with the debates that occurred in this committee and on the floor of the House and the Senate when the proposition was made to establish the dams and the nitrate plants at Muscle Shoals?

Mr. MAYO. I am not very familiar with them; no, sir.

Mr. QUIN. There were two propositions set forth at that time, the primary idea being that there should be a nitrate plant there to make powder for use by the United States Army in time of war, and that in peace times fertilizer should be made there. I was an ardent advocate of both of those propositions.

After the war terminated, Congress, after a violent debate, failed to provide for the completion of that dam. Now, the Ford proposition calls for the completion of the dams and the carrying out of both purposes for which the original plant was started, does it not?

Mr. MAYO. Yes, sir.

Mr. QUIN. Mr. Hill wasted a lot of time in asking questions and endeavoring to read out of Mr. Ford's proposition what is plainly written in it. Listen to what it says on page 18, section 17, of the report of the Secretary of War. This is the language: "In order that said company may be supplied with electric power, and the farmers with fertilizers, after the termination of the said 100-year leases, should the United States elect not to operate said power plants but determine to lease or dispose of them." Mr. Ford puts it in his proposition, does he not?

Mr. MAYO. Yes, sir.

Mr. QUIN. Then all of that questioning was just muddying the waters and scuttlesniffing around.

Mr. Mayo, one of the chief elements in the cost of fertilizer, put up by the fertilizer factories, is in the handling and sacking and mixing of this dirt with the real fertilizer, the ammonium nitrate, and the potash; is that not true?

Mr. MAYO. Yes.

Mr. QUIN. As I understand it, Mr. Ford proposes, by utilizing the sagacity of the men he has around him, to manufacture all the necessary ingredients and compounds of fertilizer in their concentrated form?

Mr. MAYO. As far as possible; yes, sir.

Mr. QUIN. He proposes, as he has done in the past, to get the best technical ability anywhere he can in the country or out of the country for that purpose?

Mr. MAYO. Yes, sir.

Mr. QUIN. It is your judgment that these compounds can be prepared and distributed in their concentrated form directly to the farmers of the United States?

Mr. MAYO. Yes, sir.

Mr. QUIN. And that the farmer, or even the free nigger, who needs no intelligence, can gather the earth out of his fence corners and out of the woods, and under the plain directions that these technical men will write as to how to mix the four or five parts of earth and dirt with concentrated fertilizer, they can fix their own fertilizer?

Mr. MAYO. That is the plan.

Mr. QUIN. In other words, it is just like the druggist mixing his medicine in the bottle and writing on there directions that it shall be mixed with so much water?

Mr. MAYO. Yes, sir.

Mr. QUIN. The farmer goes to a spring and gets his water and puts three tablespoonfuls of water with one spoonful of the medicine, following the directions of the druggist.

Mr. MAYO. Yes, sir.

Mr. QUIN. Is it not presumable that the farmers of the United States can follow the directions of Mr. Ford's experts in mixing this concentrated ferti-

MUSCLE SHOALS PROPOSITIONS.

... that they get from their own farms, just like they can following the directions they get at the drug store?

... think so.

... know it is so; I have been doing it. Is it not possible in that one of the main factors that enters into the cost of this fertilizer be the high freight rates that the railroads are charging now?

... Yes, sir.

... They have in most of the counties in the United States where fertilizer what they call farm-demonstration agents. Are you familiar with their work?

... Mr. MAYO. Not very familiar.

... Mr. QUIN. Those farm-demonstration agents are employed by the counties, and they instruct the farmers and analyze the soil and suggest what that soil needs. Those same men—and the farmers are not so ignorant as some gentlemen think they are—are intelligent enough to know how to mix the fertilizer which those farm-demonstration agents would show them how to mix. They could do that, could they not?

... Mr. MAYO. Certainly.

... Mr. QUIN. If I remember correctly, Brother Miller, the other day before you came here, suggested that there was nothing in this contract by which Mr. Ford agreed to make fertilizer. I think it has been demonstrated that it is here. Then he suggested that Mr. Ford was to get 8 per cent just for the manufacture of the fertilizer, and then that some agent of the trusts would come along and buy that and sell it to the farmers, and rob the farmers. There is no such thing as that which could be contemplated under the terms of this contract, or according to the intentions of Mr. Ford, is there?

... Mr. MAYO. I certainly do not think so.

... Mr. QUIN. Your intention is that this fertilizer shall be distributed, because it says in the agreement that it shall be distributed by a territorial distribution, which shall be directed by this board, which is provided for.

... Mr. MAYO. By the farmers' board.

... Mr. QUIN. Directly to the farmers.

... Mr. MAYO. It does not definitely say so, but that is the intent.

... Mr. QUIN. This board is to be a board of nine men, seven of whom are named by the leading farm organizations of the United States, or their successors?

... Mr. MAYO. Yes, sir.

... Mr. QUIN. And their names are sent by the President to the Senate of the United States and confirmed by the Senate. Then the Ford organization or company is to elect or name two of the members of that board?

... Mr. MAYO. Yes, sir.

... Mr. QUIN. That particular board is to have the right to look over the books and see that the cost and the selling price does not allow over 8 per cent profit to Mr. Ford. Then this board is further to see that this fertilizer is properly distributed territorially?

... Mr. MAYO. Yes, sir.

... Mr. QUIN. Then seven of the nine members of that board created and established for that purpose are directly representing the dirt farmers who will use the fertilizers?

... Mr. MAYO. Yes, sir.

... Mr. QUIN. Then there is a direct connection between the farmers and this Ford company?

... Mr. MAYO. We think so.

... Mr. QUIN. We have great respect for Mr. Ford in my country; the farmers call him Uncle Henry. He gets us the cheapest cars, and cars that poor men like me can ride in now, and I believe he is going to give us cheap fertilizer.

... Mr. MAYO. Competition did not force him to the price of his car, did it?

... Mr. QUIN. No, sir; it brought the rest of them down. And he is going to bring the prices of these fertilizer men down.

... Mr. MAYO. If you give him a chance.

... Mr. QUIN. Under the plan, as I see it, the Government building Dam No. 2 and Dam No. 3, and Mr. Ford taking all of that power under his control, he can establish not only this splendid fertilizer factory, but other factories for the benefit of the farmers and the masses of the people of this country?

... Mr. MAYO. Yes, sir.

... Mr. QUIN. Does he not contemplate doing that very thing?

... Mr. MAYO. I think so.

Mr. QUIN. Instead of Mr. Ford going into competition with the Alabama Power Co. or anybody else in the sale of power, he proposes to use this cheap power for the purpose of making the necessary things for the masses of the folks and the farmers to use at the cheapest possible cost of production; is that not true?

Mr. MAYO. That is his intention; yes, sir.

Mr. QUIN. Is it not the idea of Mr. Ford, after he gets started, to go above these dams which the Government completes, and utilize the power in the river by the construction of dams at different places to make more water power?

Mr. MAYO. He has said that it is his intention; yes, sir.

Mr. QUIN. The possibilities of water power outside of these two dams are very great, are they not?

Mr. MAYO. Yes, sir.

Mr. QUIN. The potential, inert water power is there now?

Mr. MAYO. Yes, sir.

Mr. QUIN. My friend, Mr. Miller, went at length into the details as to how many horsepower would be developed there and what Mr. Ford is being paid. That river has been there ever since the earth of the United States has been standing and been washed by the oceans, has it not?

Mr. MAYO. I expect so.

Mr. QUIN. Has anybody up to this good hour ever built those dams to utilize that water power which Mr. Miller thinks Mr. Ford is going to get for nothing?

Mr. MAYO. No, sir.

Mr. QUIN. The Chief Engineer of the United States Army, Gen. Beach, for whom we have great respect, stated that that is the finest water-power stream in the United States. He did say that the St. Lawrence River might possibly have a little more power, but a part of that is in Canada. Now, with the ambition of Mr. Ford, and with the money behind him, I do not believe he wants this proposition for the purpose of making money out of it; I know he has more money than he can ever spend.

Mr. MAYO. Yes.

Mr. QUIN. Is it not possible that instead of those woods and the tall trees with the wind whistling through them there will be there humming factory wheels with hundreds of thousands or even millions of men employed in industries which are run for the benefit of the masses of the American people?

Mr. MAYO. We hope so.

Mr. QUIN. As I understand it, the rich need no help along this line; it is the poor people in the United States that need the help of Mr. Ford and men like him to develop enterprises of this kind.

Mr. MAYO. We think so.

Mr. QUIN. His ultimate ambition is to lend his life and his great wealth and his ability and the brains he can employ to help the poor men like me and the rest of us.

Mr. MAYO. Yes, sir.

Mr. QUIN. Then if Mr. Ford does happen to get this secondary water power for \$6 a horsepower per year and this primary water power for \$18 per horsepower per year, which the Government is throwing away now, would it not be to the paramount interest of the United States to accept the Ford proposition and let him take it on those terms, or even give it to him?

Mr. MAYO. We think so.

Mr. QUIN. With all of the possibilities in view for making by-products, is it not reasonable to conclude that Mr. Ford can make the fertilizer compound almost as a waste, at a very low cost, because of the valuable products he can get in the metallic line?

Mr. MAYO. That is one of the possibilities; yes, sir.

Mr. QUIN. The electro furnace can do much in that regard, can it not?

Mr. MAYO. A very great deal.

Mr. QUIN. Is it not possible that through the scientific endeavor of the brains he can get in the United States or across the water, that many valuable metals can be gotten out of this enterprise and fertilizer will be almost a mere waste, and he can make it so cheaply that he can almost give it to the farmers of the United States.

Mr. MAYO. That is one of the possibilities.

Mr. QUIN. I believe that. If Dam No. 2 is completed in the time specified, will Mr. Ford be making fertilizer at that time?

Mr. MAYO. His intention was to start making it within a year.

Mr. QUIN. Maj. Burns, of the Ordnance Department of the Army, stated the other day that one-half of the nitrogen element of the fertilizer in the United

States can be produced there out of this 110,000 tons of ammonium nitrate per year. Is that correct? I believe you stated about one-fifth, or 20 per cent.

Mr. MAYO. I think I am nearer correct than he, as to percentage of total nitrogen.

Mr. QUIN. Gen. Williams stated the other day that although he did not doubt that could be done in the long run, he put the total at 8,000,000 tons. I think he was in error, and I think Maj. Burns was more nearly correct.

Mr. MAYO. Seven or eight million tons—

Mr. QUIN (interposing). The maximum was 8,000,000 tons; but they never have used quite that much. But we are going to use a great deal more fertilizer when we get it cheaper. You do not know what the exact figure is, do you?

Mr. MAYO. I do not know the exact figure of total fertilizer tonnage of all kinds.

Mr. QUIN. I wish you would get that, if you please, and put it in the record.

Consumption of fertilizers in the United States, fiscal years ending 1913 to 1920.

[From the American Fertilizer Handbook for 1921, p. 20.]

	Tons.		Tons.
1913.....	6,544,345	1917.....	6,206,543
1914.....	7,340,528	1918.....	6,756,743
1915.....	5,563,212	1919.....	6,891,322
1916.....	5,390,549	1920.....	7,654,239

Mr. MAYO. I shall be glad to do that for you.

Mr. QUIN. Then my friend, Brother Miller, stated at the outset that this plant could not produce more than one-thirtieth or one-fortieth of all the fertilizer in the United States. That can not be true, can it?

Mr. MAYO. I think he is mistaken in the way he figures it.

Mr. QUIN. And that the output at this plant would not materially affect the price?

Mr. MAYO. We think it will have a great bearing on the price.

Mr. QUIN. Undoubtedly it will. If these fertilizer people did not think so they would not be objecting to this proposition, would they?

Mr. MAYO. No; I do not believe they would.

Mr. QUIN. They have never objected to me going into any business I wanted to because they know I could not hurt them. The real fight here has been around this Alabama Power Co. plant, the company claiming to have a certain contract with the Government. Have you a copy of that contract with you?

Mr. MAYO. No, sir; I have not.

Mr. QUIN. They claim that this Warrior plant, which is 88 miles away from the nitrate plant No. 2, is theirs. Is it really necessary for Mr. Ford to have that Warrior plant and the transmission line that is involved in that?

Mr. MAYO. It is the cheapest source of steam power he could get. It is much cheaper than the steam plant at No. 2 nitrate plant, due to the fact that you do not have to transport your coal there.

Mr. QUIN. The coal is already close at hand?

Mr. MAYO. The coal is near the power house at Gorgas.

Mr. QUIN. That territory in Alabama adjacent to and within reasonable transportation distance from the Muscle Shoals dam has iron, coke, coal, limestone, and phosphorus, has it not?

Mr. MAYO. It has all but the coke.

Mr. QUIN. They have not any coke down there?

Mr. MAYO. No, sir.

Mr. QUIN. Mr. Ford can make the coke, can he not?

Mr. MAYO. I think so.

Mr. QUIN. If he can make anything else, he can make the coke. Then they have everything in that territory that is necessary to successfully operate a fertilizer factory?

Mr. MAYO. Practically so; yes, sir.

Mr. QUIN. How much nitrogen is there over every square yard of ground?

Mr. MAYO. About 7 tons.

Mr. QUIN. Some of these folks must have a fear that taking nitrogen out of the air is going to hurt the health of the people. There is no danger in that, is there?

Mr. MAYO. No, sir.

Mr. QUIN. Mr. Crowther suggested the other day that all of us farmers seem to believe we are going to have big funnels through which we will bring the

nitrogen out of the air. Then he seemed to think that we thought we would get it out of the air and have it come down through the funnel, and get it in that way. But it has not hurt the air so far, has it, to take the nitrogen out of the air? It has not affected the health of the people, and it has had no deleterious effect on the agricultural plants of the farmers in that territory, has it?

Mr. MAYO. No, sir.

Mr. QUIN. That is one of the things I have been expecting them to jump at. Mr. Mayo, did you notice the vote of Congress by which it was decided not to complete this dam at the time we failed to provide for its completion, after the war was over?

Mr. MAYO. No; I did not.

Mr. QUIN. Some able gentleman stated that the reason the Government could not complete this project was because it cost them too much money down there, with the use of this fine water power, to make this nitrogen. Some of them objected to this, and the Secretary of War said that if Mr. Ford could make this fertilizer cheap enough, and they could get a 50-year lease, he would not oppose it. That is the substance of what he said. You believe that through the processes that would be put into operation Mr. Ford can make this fertilizer cheap enough, do you not?

Mr. MAYO. I am sure of it.

Mr. QUIN. And not only would make that plant a success, but would force down the price of the fertilizer throughout the United States?

Mr. MAYO. We hope so.

Mr. QUIN. Competition will always do that?

Mr. MAYO. Yes, sir.

Mr. QUIN. Some gentleman suggested that these foreign imports might get the price of fertilizer so low that Mr. Ford could not afford to operate down there. They never have done that; there is no danger of that, is there?

Mr. MAYO. We do not think so.

Mr. QUIN. If it did it, would it not be a great boon and blessing to the farmers of the United States if they could get the foreigners to put it in here cheaper even than Mr. Ford is going to make it?

Mr. MAYO. Yes, sir.

(Thereupon, a recess was taken until 2 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

STATEMENT OF MR. WILLIAM B. MAYO—Resumed.

The CHAIRMAN. Mr. Mayo, when we took a recess Mr. Quin was proceeding with his questioning of you. He will now continue.

Mr. QUIN. Mr. Mayo, then there is no doubt but what the cost of fertilizer to the ultimate consumer will be greatly decreased in price?

Mr. MAYO. No doubt in my opinion, sir.

Mr. QUIN. After the completion of Dam No. 2 and Dam No. 3 there will be a natural increase in the navigation of the streams, will there not?

Mr. MAYO. Yes, sir.

Mr. QUIN. Then, if Mr. Ford puts in other dams, that would still increase the navigation of those streams?

Mr. MAYO. Yes, sir.

Mr. QUIN. And that would make an outlet from the remotest part that would be navigable into the Ohio River, would it not?

Mr. MAYO. I think so.

Mr. QUIN. Steamboats and barges could carry the product from Muscle Shoals into the Ohio River, thence into the Mississippi, clear to the Gulf of Mexico, and then up above as far as navigation would permit?

Mr. MAYO. Yes, sir.

Mr. QUIN. It would increase, then, the amount of navigation sufficiently to justify the Government, from the standpoint of navigation alone, in completing those dams, would it not?

Mr. MAYO. I think so, but I do not want to go into tonnage figures.

Mr. QUIN. Gen. Beach, the Chief of Engineers of the War Department, testified it would cost eight or ten million dollars to clean out the Muscle Shoals stretch, not considering the dams.

Mr. MAYO. Yes, sir.

Mr. QUIN. Then, the construction of these dams will add about 850,000 horsepower, both primary and secondary combined, would it not?

Mr. MAYO. Yes.

Mr. QUIN. And the other dams contemplated by Mr. Ford, if he succeeds in this industry, will create a large amount of horsepower at those points, will they not?

Mr. MAYO. Yes, sir.

Mr. QUIN. It is fair to assume that with the cheap water power at those points the cost of manufacture of farm implements could be greatly reduced, could it not?

Mr. MAYO. I would say so.

Mr. QUIN. All kinds of plows, harrows, binders, reapers, mowers, and everything, in fact, that it takes to till the soil?

Mr. MAYO. Yes, sir.

Mr. QUIN. Then, that point could be made, and no doubt will be made, under Mr. Ford's direction the great creative point for the fertilizer for the soil and for the implements to cultivate the soil with.

Mr. MAYO. We hope so.

Mr. QUIN. He has already created for the farmer the tractor, has he not?

Mr. MAYO. Yes, sir.

Mr. QUIN. At a very moderate cost to the farmer.

Mr. GREENE. Mr. Quin, will you pardon me for asking you a question? Do you mean to say he is going to manufacture all these farming implements down there; is that your idea?

Mr. QUIN. I think that he is going to follow in the course of time when he gets it; either Mr. Ford or somebody else.

Mr. GREENE. I was somewhat late and I just wanted to know whether that was the line along which you are questioning the witness.

Mr. QUIN. Yes. There will be these incidental factories in connection with this horsepower that the Government has down there now.

The CHAIRMAN. The witness testified yesterday that he was going to take plant No. 1 and use it in conjunction with the manufacture of automobiles.

Mr. QUIN. Well, that is a good thing. We have the five-passenger Ford touring car now selling f. o. b. factory at \$345, have we not?

Mr. MAYO. Yes, sir.

Mr. QUIN. Would not the farmer be able to take that automobile and put a trailer on it and haul this fertilizer out to his farm at a small cost?

Mr. MAYO. Yes, sir.

Mr. QUIN. And he could haul the products of his farm back to the local shipping point at a small cost?

Mr. MAYO. Yes, sir.

Mr. QUIN. Then if he gets his farm implements at a cost in proportion to the cost of the Ford touring car and the Ford tractor, it will mean the saving of many millions of dollars a year to the farmers of the United States, will it not?

Mr. MAYO. Yes, sir.

Mr. QUIN. Mr. Miller in discussing the unit value of this horsepower overlooked the point of navigation that the Government gets out of it; he further overlooked the saving to the people of the United States in fertilizer alone; he further overlooked the contemplated features that may come to the farmers and other masses of the American people. If 8,000,000 tons of fertilizer are used a year, and its cost to the farmer is reduced about one-half of the cost at which they are getting it now, will not that be equal to all this supposed horsepower that Mr. Miller is valuing against this proposition?

Mr. MAYO. I do not know how it would balance up, but it would surely make a great saving.

Mr. QUIN. This Warrior plant that was constructed by the Alabama Power Co. is what type of industry? What is it, just a power plant of steam or water?

Mr. MAYO. Steam.

Mr. QUIN. A steam power plant?

Mr. MAYO. Yes, sir.

Mr. QUIN. Under their contract with the Government they were to charge 6½ mills per kilowatt, I believe.

Mr. MAYO. I think it is 6½.

Mr. QUIN. The Alabama Power Co. is owned by the Alabama Traction, Light & Power Co. (Ltd.), of the Dominion of Canada; in other words, controlled by an alien corporation, citizens of Great Britain.

The CHAIRMAN. Did the witness answer that?

Mr. MAYO. No, sir; I did not answer it. I do not know.

Mr. QUIN. That is a matter of record. Congress knows that and it is reported in the reports that the War Expenditures Committee made upon investigating that question.

Mr. CROWTHER. Can we not have that printed? Do you know where that appears?

Mr. QUIN. I am putting it in the record now. I would be glad to put in the report of Mr. Graham and his examination, and Mr. Garrett's examination, if you want it.

This Alabama Power Co., owned and controlled by the citizens of Great Britain and that being an alien corporation that directly controls the Alabama Power Co., under the purported contract I asked you about before noon, would have control of this immense water power and also the Government's nitrate plant No. 2 at Muscle Shoals, would it not?

Mr. MAYO. I do not quite follow you. You mean if they kept their plant?

Mr. QUIN. Yes; if the Government was forced to keep this alleged contract with that corporation.

Mr. MAYO. No; as I look at it, they would simply have a source of power to the extent of 30,000 kilowatts.

Mr. QUIN. Mr. Ford's proposition proposes to keep and will keep the nitrate plant for the purpose of making nitrates for the Government in time of emergency or in time of war, ready at all times.

Mr. MAYO. Yes, sir.

Mr. QUIN. The maximum capacity of that plant now is 110,000 tons per annum.

Mr. MAYO. Yes, sir; of ammonium nitrate.

Mr. QUIN. Mr. Ford's proposition includes the transmission line and the Warrior plant?

Mr. MAYO. Yes, sir.

Mr. QUIN. Then he expects the United States Government to nullify that existing, alleged contract, and proceed by condemnation proceedings or otherwise to give title to Mr. Ford?

Mr. MAYO. He simply asks the title of it.

Mr. QUIN. Some gentlemen seem to think that would be a very hard thing to do, but I do not.

Mr. MAYO. We do not think so.

Mr. QUIN. I believe the circumstances surrounding the contract made with this corporation, controlled and directed by a corporation of the Dominion of Canada would not be held by any respectable court in this country to be binding on the United States. The fact of it is that when I think of the terms and conditions and the circumstances under which they were imposed on this Government, a bad polecaty odor passes by my nostrils.

Mr. MAYO, how far, if you have estimated it, would navigation be increased by the proposed dams?

Mr. MAYO. About 80 miles.

The CHAIRMAN. That is the evidence before the committee, about 80 miles.

Mr. FISHER. Is it your judgment that the operation of nitrate plant No. 2 by Mr. Ford under the terms of the contract would bring about a material reduction in the cost of fertilizer to the farmers of this country.

Mr. MAYO. Yes, sir.

Mr. FISHER. Just what is the exact figure, as estimated, if you have it before you, as to the value to the Federal Government of a plant, just as nitrate plant No. 2 would be, when operated according to section 16 of the contract; could you give some estimate of what the value would be to the Government?

Mr. MAYO. Mr. Williams's report states the amount as \$11,000,000, which appears reasonable.

Mr. FISHER. Have you made the investigations relative to the manufacture of fertilizer recently, within the last three or four months?

Mr. MAYO. We are making investigations right along and have been ever since we made the first offer seven months ago.

Mr. WRIGHT. Mr. Mayo, first of all, I want to ask you some questions with reference to the figures suggested by Mr. Miller. I will get you to first explain to the committee the difference between primary and secondary horsepower.

Mr. MAYO. Primary horsepower is that amount of power which you can get 365 days in the year.

Mr. WRIGHT. Right in that connection, is not that the real power that any water-power company figures on?

Mr. MAYO. That is the power that all water powers are based upon.

Mr. WRIGHT. That is the substantial, normal, continuous power which they get the year around?

Mr. MAYO. Yes, sir.

MUSCLE SHOALS PROPOSITIONS.

and it is the only kind that most manufacturers or industrial plants want to buy, because they want it every day in the year except

They must have it regularly.
What is secondary power?

Secondary power is that power which is in excess of the primary power and comes due to the flow of the river; that is, which changes due to the flow.

Mr. Miller asked you about the maximum secondary power, did

Yes, sir.

That these plants were capable of producing?

Yes, sir.

Do you understand that that means that 365 days in the year that much secondary horsepower available?

It may only be 30 days.

It may be only 30 days in the entire year?

Yes, sir.

So that it is extremely difficult to dispose of that secondary power, is it not?

Practically impossible.

He estimated that would be worth \$6 a horsepower?

Yes, sir.

His figures contemplated it would bring that the year around?

Yes, sir; I so understood it.

As a matter of fact, the secondary horsepower would be figured liberally if you estimated it at one-third of the price of the primary power, would it not?

I would say so.

And then, would it not be sound, conservative business judgment to again divide that by three as what you might ultimately get out of the secondary power?

That is my opinion.

So that it all depends on the figures presented as to what the ultimate result is.

Yes, sir.

In other words, you have heard of the man who figured on a little sawmill. He figured that he could produce 10,000 square feet of lumber a day, which would bring him on the market \$1,000, and that he could buy that lumber standing for \$50, and he figured he would have a net profit of \$950, failing to take into account the overhead, the expense of logging to the mill, the expense of maintenance, and the expense of labor.

And whether he could get it all to the mill or not, and then sell it.

Mr. Wright. Yes. Mr. Miller further figures against the interest charges that the Government would receive from Mr. Ford or his company and the amounts for maintenance of the dams, etc., this approximated value that Mr. Ford would get for the primary and secondary power, does he not?

Yes, sir.

Without taking into account what it would cost to produce that power?

Yes, sir.

Or whether there would be a market for it or not. There are various contingencies attending any enterprise, are there not, Mr. Mayo?

We have found it so.

You know how that gentleman came out who made the calculation on the sawmill. He said that he broke so badly that he could not have paid his debts if he had had the money.

Now, Mr. Mayo, would you object to giving to the committee your view of the advantages of a 100-year lease rather than a 50-year lease, and why a long lease would be necessary at this particular plant?

Well, on account of the size of the project and the immense amount of capital necessary to develop it to such an extent that we can use all the power, Mr. Ford felt that in 50 years he would perhaps only have made a good start.

First of all, you would have to take into account the time that would be required to equip these plants, complete the dams, and install the power houses and the apparatus?

Yes, sir.

Mr. WRIGHT. What would be the next element of delay in using the power—would you not have to develop industries?

Mr. MAYO. We would have to develop industries to consume it; yes, sir.

Mr. WRIGHT. And you figured 15 to 20 years would be required in doing that?

Mr. MAYO. Probably.

Mr. WRIGHT. Are there any other elements that would argue in favor of a long lease, from Mr. Ford's standpoint?

Mr. MAYO. It would give him a good chance to make part of the secondary power primary.

Mr. WRIGHT. In other words, if he had some industry right there on the ground that might stand idle part of the time and be run part of the time with some profit, he could utilize at least some of this secondary power.

Mr. MAYO. Yes; and it would give him time to develop other dams up the river and increase the primary or secondary power.

Mr. WRIGHT. That would inevitably result in an increase in primary power—the construction of other dams above there?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Tell the committee why that would be true?

Mr. MAYO. It increases the pondage and storage capacity available for regulating the flow of the river.

Mr. WRIGHT. The storage of the water?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. And instead of its going to waste, it is stored or impounded.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Speaking about interest, if it is true that the Government has already expended on these projects, in round numbers \$105,000,000, is not that amount lying there idle today, except for the small amount the Government may be receiving from the Alabama Power Co. for some of this power?

Mr. MAYO. That is as I understand it; yes, sir.

Mr. WRIGHT. What would be the annual interest at 4 per cent on \$105,000,000? Of course that is a matter of calculation, and it would be \$4,200,000, would it not?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Is not the Government losing that?

Mr. MAYO. It strikes me so.

Mr. WRIGHT. In addition to that, is there not necessarily a heavy charge in maintaining or watching this property and keeping guard over it?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. That would amount to several hundred thousand dollars a year.

Mr. MAYO. Around \$750,000 a year.

Mr. WRIGHT. Then in addition to that, Mr. Mayo, is it not true that any plant, especially this nitrate plant No. 2, which is kept in a standby or idle condition, will deteriorate very rapidly.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. And finally rust out?

Mr. MAYO. The Ordnance Department has figured it on a 5 per cent annual depreciation basis.

Mr. WRIGHT. So that all of those elements would enter into the amount the Government is now losing.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Mr. Mayo, on yesterday this clause in the proposal of Mr. Ford was touched upon. It is the clause which obligates Mr. Ford to maintain and operate nitrate plant No. 2 during the life of this proposed contract.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Can you turn to that section—section 14, is it not?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. I want to call your attention to the language employed there:

"The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control," etc.

Now, do you not understand from that provision that Mr. Ford would be bound during the entire 100-year period to produce something which was equivalent to 110,000 tons of ammonium nitrate per annum.

Mr. MAYO. I do.

Mr. WRIGHT. Something which would contain that much fertilizer properties?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. At this nitrate plant No. 2?

Mr. MAYO. That is the intent.

Mr. WRIGHT. Although the form of producing might change or the method might change?

Mr. MAYO. We expect it would.

Mr. WRIGHT. He would be bound to employ something there that would produce the equivalent of this 110,000 tons.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. You were asked, if that could not be done at a profit, whether Mr. Ford would be bound to continue under the provisions of section 14 to manufacture this ingredient.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Do you understand that would have anything to do with his obligation to comply with this provision, even if he did have to sustain a little loss?

Mr. MAYO. I think if he were forced to make it at a serious loss that probably the Government would not require him to do it; no.

Mr. WRIGHT. Or he would adopt some other method.

Mr. MAYO. I expect that after he had tried every other method, if he still continued to manufacture at a loss and there was no chance, or it would seem to be beyond human possibility, then he would be relieved of that duty.

Mr. WRIGHT. Do you contemplate any such situation arising?

Mr. MAYO. Certainly not.

Mr. WRIGHT. Now, I want to ask you about the provision here in section 17 of the contract, about which Mr. Hill asked you. Does not that simply mean that at the expiration of the 100-year lease, if the Government does not actually desire to own and operate this plant, but desires to sell it or lease it, that the Ford company will be given the option or the privilege, first, to negotiate with the Government to secure as much power as it may need.

Mr. MAYO. That is the way I take it.

Mr. WRIGHT. And the very words of that provision indicate that the terms will have to be agreed upon.

Mr. MAYO. Yes, sir.

Mr. WRIGHT. Not only the price but the length of time the company might be permitted to use the power.

Mr. MAYO. I would say so; yes, sir.

Mr. WRIGHT. So that is simply an open question, the only thing being that Mr. Ford would have the preference, all other things being equal?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. You were asked by Mr. Parker about the right of Mr. Ford to mortgage or alienate or encumber these properties to which he is to receive title. Of course, we understand he does not get title to Dam No. 2 and Dam No. 3?

Mr. MAYO. No.

Mr. WRIGHT. But the Government is to convey to him all the other properties?

Mr. MAYO. Yes, sir.

Mr. WRIGHT. But it is conveyed in accordance with the terms of this proposal?

Mr. MAYO. That is my understanding.

Mr. WRIGHT. This being a matter of public record that will go into an act of Congress, would not the whole world be charged with notice of the manner in which Mr. Ford held that property?

Mr. MAYO. I would say so.

Mr. WRIGHT. And whether it was put in the deed, in the first instance, and then in the mortgage, would not whoever dealt with Mr. Ford in reference to these properties deal with him in reference to the provisions in this contract?

Mr. MAYO. I should certainly say so.

Mr. WRIGHT. In other words, he could not convey any greater title than he had acquired from the Government?

Mr. MAYO. No, sir.

Mr. WRIGHT. And if he undertook to mortgage or encumber the property in any other way these same provisions would attach to it?

Mr. MAYO. I would say so.

Mr. WRIGHT. I would say so.

Mr. STOLL. Mr. Mayo, under Mr. Ford's offer relative now solely to dams 2 and 3, as I understand it, he requires of the Government three things; the first

is to acquire the necessary lands and flowage rights, including land for railroads and terminal connections?

Mr. MAYO. Yes, sir.

Mr. STOLL. Have you estimated what that would cost?

Mr. MAYO. The flowage rights for Dam No. 3 were estimated at a maximum of \$1,500,000. The flowage rights and practically all of the railroad rights of way for Dam 2 have already been secured. They go with Dam No. 2.

Mr. STOLL. So that there would be under that item about \$1,500,000 required?

Mr. MAYO. There might be a half million dollars more, possibly. There are some leased properties at Dam No. 2 which were never purchased.

Mr. STOLL. The second requirement of the offer on the Government is to repair, operate, and maintain the dams, locks, and gates. For this Mr. Ford offers to pay \$35,000 and \$20,000, respectively, for dams 2 and 3. Will that be sufficient to operate, repair, and maintain the dams, locks, and gates?

Mr. MAYO. We think it will. That is not including the power houses and its apparatus. That is taken care of under a separate fund.

Mr. STOLL. The third requirement is to furnish the necessary money to complete Dam No. 2 and install the machinery and to build Dam No. 3 and install the necessary machinery. You estimated that, I believe, to cost about \$40,000,000.

Mr. MAYO. Yes, sir.

Mr. STOLL. Under Mr. Ford's offer the United States gets very little in return on its investment for the first three years, as was brought out by Mr. Miller's questions.

Mr. MAYO. Yes, sir.

Mr. STOLL. To look at that properly, is it not really a problem in arithmetical progression, does not the Government as the years go by get more by the creation of this sinking fund that Mr. Ford proposes to establish?

Mr. MAYO. The sinking fund finally wipes out the entire cost.

Mr. STOLL. That is what I know, and so I say that as the years go by the Government has a smaller amount invested. For instance, at the end of 20 years, with the sinking fund going to the Government, it would be a smaller investment than the Government had at first.

Mr. MAYO. Yes, sir; that is correct.

Mr. STOLL. And in 50 years it would still be less, and so on until it is finally wiped out.

Mr. MAYO. Yes, sir.

Mr. STOLL. Would it be possible for you to have a table made showing the way that decreases? It may be impracticable to do that; I do not know.

Mr. MAYO. I think that can be very readily done; yes.

Mr. STOLL. I wish you would have that statement put in the record.

Mr. MAYO. All right, sir.

Table illustrating decrease in net investment of Government due to operation of a sinking fund.

Assume: Payments into sinking fund total \$46,746 annually, sinking-fund investments to bear 4 per cent interest, payable annually. Government investment taken at \$48,000,000.

Life of fund.	Total amount in sinking fund.	Striking a balance at the end of each period the Government's net investment is—
25 years.....	\$2,024,560	\$45,975,431
50 years.....	7,421,862	40,578,138
75 years.....	21,806,346	26,190,654
90 years.....	40,250,643	7,749,357
100 years.....	60,163,271

NOTE.—If the sinking-fund investments bore interest at 4 per cent payable semiannually, the amount in the sinking fund at the end of 100 years would be \$61,973,977. In Mr. Ford's offer the sinking fund for Dam No. 3 runs 94 years and that for Dam No. 2 runs 97 years. The above table is intended simply as an illustration of the amortising effect of a 4 per cent sinking fund over several periods of years, maintained by annual payments equal to the payments offered by Mr. Ford.

Mr. STOLL. Because the figures as Mr. Miller presented them I do not think carry the correct idea as to the expense the Government is put to in this project under Mr. Ford's offer.

Mr. MAYO. The offsets to the expenses, as I brought up before, are very great during the first few years.

Mr. STOLL. Yes; I understand that; but to my mind, as the years go by, this decreases.

Mr. MAYO. Yes, sir.

Mr. STOLL. The Government gets more return and has less money invested.

Mr. MAYO. The Government's net investment is steadily decreasing.

Mr. STOLL. Do you know how many tons of sulphate of ammonium can be produced under your plan annually?

Mr. MAYO. It all depends. We would have to put in a sulphate plant to make any sulphate of ammonia. We would have to put in a sulphuric acid plant to start with. If we use the same amount of nitrogen that the plant is now equipped for, it runs to 190,000 tons annually.

Mr. STOLL. Under section 19 of Mr. Ford's offer he agrees to enter into a contract to effectuate the purposes of his agreement. Do you understand that to mean he will put in the necessary guaranties that are usually required in business contracts, to do what he promises to do?

Mr. MAYO. What would you term as a guaranty?

Mr. STOLL. First, he binds himself—

Mr. MAYO (interposing). He pays the money. He does not receive title until he pays the purchase price. That would, of course, guarantee the purchase. After that he would have to put in the necessary amount of working capital to make it operative.

Mr. STOLL. I understand, but here is what he says:

"Upon acceptance, the promises, undertakings, and obligations shall be binding upon the United States, and jointly and severally upon the undersigned, his heirs, representatives, and assigns, and the company, its successors, and assigns; and all the necessary contracts, leases, deeds, and other instruments necessary or appropriate to effectuate the purposes of this proposal shall be duly executed," and so on.

He promises to do certain things. Is any guaranty contemplated in the contract? What do you mean by "effectuate"?

Mr. MAYO. The passage of the proper papers and deeds and everything that go with settling the titles. Did you have in mind a bond or something of that sort?

Mr. STOLL. I did not know a bond or paid-up capital or something that would make it a real business contract.

Mr. MAYO. The amount of the purchase price, the amount of money that has to be put in as working capital to start with, I think is a sufficient guaranty.

Mr. STOLL. But this is silent as to what that would be.

Mr. MAYO. It is silent because it is problematical how much it will take.

Mr. STOLL. I understand. I am not complaining about the offer as it stands, but I am speaking of how it will be consummated. Do you not think something ought to be in there more definite than that.

Mr. MAYO. I do not think so.

Mr. STOLL. You think that is sufficient.

Mr. MAYO. He has to carry out the terms of that contract, and when he does he at least has to operate the nitrate plant No. 2 at full capacity, which will require sufficient added capital to have plenty to reimburse the Government for any breach of contract.

Mr. STOLL. Do you think it probable that Mr. Ford will increase the production of fertilizer over the present capacity of plant No. 2.

Mr. MAYO. I think it is very probable.

Mr. STOLL. And it is his intention, of course, to give the consumers the benefit of the cheap power.

Mr. MAYO. Yes, sir.

Mr. STOLL. What will be saved by the Government in constructing Dams Nos. 2 and 3 if the work is done by Mr. Ford without any profit to himself rather than if they follow the usual plan.

Mr. MAYO. We were of the opinion it could be done much quicker on account of not being bound up with the ordinary governmental red tape, and he could also handle the contracts to much better advantage as a private party instead of as the Government.

Mr. STOLL. And there would be considerable saving in money?

Mr. MAYO. Yes, sir; both money and time.

Mr. STOLL. Do you have any idea of how much that would amount to, unless that is shown by the estimates made by the Engineers and by you? Is that a fair estimate of what the saving will be?

Mr. MAYO. That is a fair estimate. That is a difference of approximately \$16,000,000.

Mr. STOLL. Is there any way you could use or sell the maximum horsepower for the first few years of operation at Muscle Shoals?

Mr. MAYO. No, sir; no possible way.

Mr. STOLL. You would have to develop the business to use it?

Mr. MAYO. Yes, sir.

Mr. STOLL. Following Mr. Miller's questions asked you on yesterday, did you prepare any figures?

Mr. MAYO. We prepared a sheet of figures; yes, sir.

Mr. STOLL. Relative to what?

Mr. MAYO. Relative to the cost to the Government and the credits during the first six years.

Mr. STOLL. I would like to have that put in the record.

Mr. MAYO. All right, sir.

Mr. STOLL. Would you mind reading it?

The CHAIRMAN. I was just going to say that probably it is short and could be read.

Mr. MAYO. It is not very long.

(The statement which Mr. Mayo read is as follows:)

Government balance sheet at Muscle Shoals during first 6 years of Ford lease of Dam No. 2.

[Assume, as stated by Secretary Weeks, that the net revenue from leases of steam plants pays the cost of maintenance of nitrate properties.]

Items. ¹	Debit.	Credit.
Interest during construction:		
Account Dam No. 2.....	\$1,368,800	
Account Dam No. 3.....	1,480,000	
	\$2,878,800	
Interest on Government investment during first 6 years of Ford lease of Dam No. 2:		
Account Dam No. 2.....	4,648,000	
Account Dam No. 3.....	3,040,000	
	7,688,000	
Payments by Mr. Ford, first 6 years of Ford lease of Dam No. 2:		
Account Dam No. 2, 6 payments at \$200,000.....	1,200,000	
Account Dam No. 2—		
3 payments at \$160,000.....	\$480,000	
3 payments at \$760,000.....	1,520,000	
	2,000,000	
		\$3,200,000
Depreciation on nitrate plant No. 2 for 7 years ² at \$2,350,000 (see letter of Maj. J. H. Burns to Congressman Fields, Feb. 6, 1922).....		16,480,000
Total.....	10,556,800	19,680,000

¹ For details regarding interest figures see p. 248.

² Since the Ford lease of Dam No. 2 begins when the first 100,000 horsepower is installed, and since it is estimated that there will be one year construction period prior to the installation of 100,000 horsepower at Dam No. 2, there will be a 7-year period of depreciation of nitrate plant No. 2, which is assumed by Mr. Ford and must be carried by him prior to the expiration of the first 6 years of the Ford lease of Dam No. 2.

NOTE.—Ordinance Department figures depreciation on nitrate plant No. 2, 5 per cent.

Mr. STOLL. Mr. Mayo, have you ever seen the Gorgas steam plant?

Mr. MAYO. I have not; no, sir.

Mr. GARRETT. Mr. Mayo, I want to get a little more specific information in regard to this fertilizer. In this contract you agree to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control. I want to get in figures

now the number of finished tons of fertilizer ready for use by the farmer that that would be equivalent to per annum.

Mr. MAYO. That depends, of course, upon the process you use, the kind of fertilizer you are making, and the percentage of plant food.

Mr. GARRETT. Well, we will say you are making a tobacco grower; how many tons of average tobacco grower, about a 2-4-8 compound or something like that?

Mr. MAYO. You are getting me kind of astray, because I do not know much about tobacco growing. I know a little about smoking. What percentage of nitrogen would you want?

Mr. GARRETT. I would want 2 per cent of nitrogen and the other ingredients in the usual proportions in such compounds, 4 per cent and 8 per cent.

Mr. MAYO. It would run almost 2,000,000 tons with 2 per cent nitrogen.

Mr. GARRETT. The 2,000,000 tons of average tobacco grower is distributed over the country by the other companies. That would be about 2,000,000 tons per annum?

Mr. MAYO. Yes, sir.

Mr. GARRETT. There has been a good deal said here about whether or not Mr. Ford or his company would continue to manufacture this fertilizer in the event he could not do so profitably. There is nothing in this contract about excusing Mr. Ford from making fertilizer whether he is making it profitably or unprofitably. The only limit in here that I find is that he agrees to make it and not charge more than 8 per cent profit.

Mr. MAYO. Yes, sir.

Mr. GARRETT. Where does the idea spring that Mr. Ford, with the single exceptions pointed out here, that is being prevented by strikes, fires, accidents, or other causes beyond his control, etc., that there is anything in there that would relieve Mr. Ford from making fertilizer at the rate of 2,000,000 tons per year of the finished product, if he was not making it at a profit, but simply making it for cost or below cost?

Mr. MAYO. Oh, I think if he was only making it at cost, he would have to continue.

Mr. GARRETT. Where is he excused from this condition, if it is below cost, according to this contract?

Mr. MAYO. You can not do the impossible.

Mr. GARRETT. Suppose he should not make a profit for one year, the conditions might change in another year, do you not think there should be some construction of that contract as to just what it means. If he should operate at a loss for one year, could he discontinue the manufacture of fertilizer?

Mr. MAYO. I do not think he could, sir.

Mr. GARRETT. That is a very essential thing in this investigation, Mr. Mayo.

Mr. MAYO. I realize that.

Mr. GARRETT. You have developed about the power and what that means and what it means to the Government to have plant No. 2 maintained there for military purposes. All that has been gone into, but you have not got the facts in the record just like I would like to see them in the record on this fertilizer question.

Mr. MAYO. As we look at it, Mr. Ford would not be excused until he had exhausted every known effort to make cheap fertilizer, using any reasonably good process.

Mr. GARRETT. You stated in answer to a question by some gentleman here this morning that you thought he could make fertilizer 50 per cent cheaper than it is being made to-day.

Mr. MAYO. We think so; yes, sir.

Mr. GARRETT. On what do you base that statement.

Mr. MAYO. Well, we base that on a number of processes, any one of which we may adopt.

Mr. GARRETT. You mean that you have in mind processes for the manufacture of fertilizer that have not yet been developed by any of the other companies?

Mr. MAYO. Yes, sir; or partly developed by some of them.

Mr. GARRETT. What I want to get at is this: Regardless of that, because that is something we do not know about now, but we do know that fertilizer is being made, and how it is being made, and how it is being distributed now.

Mr. MAYO. Yes, sir.

Mr. GARRETT. And what I want to get in the record is how much cheaper can Mr. Ford, in your opinion, make the fertilizer at this plant, if the Government

accepts his offer, at the rate of about 2,000,000 tons per year than it is now being made generally throughout the country.

Mr. MAYO. Of course, we are green at the fertilizer business, and I could not exactly say, but Mr. Washburn, in his statement, said he thought it could be made there at about one-half the price.

Mr. GARRETT. Do you think you would be safe in saying to the committee, as the spokesman of Mr. Ford, that it would be made 33½ per cent cheaper than it is being made and distributed to the farmer now?

Mr. MAYO. Yes, sir.

Mr. GARRETT. And of equally good quality?

Mr. MAYO. I think it is perfectly safe to figure on that.

Mr. GARRETT. If your plant makes about 2,000,000 tons of finished fertilizer, speaking in round numbers, and there is only about seven and a half or eight million tons consumed in the country, you would control at that plant about one-third or one-fourth, at least, of the total output of fertilizer in the United States, would you not?

Mr. MAYO. If the rest of the country stood still, we would; yes, sir.

Mr. GARRETT. And if the rest of the country moves on, you would move at the same pace that they did; so that your proposition now, as I understand it, on the fertilizer question, is that you will make as much finished fertilizer as will be equal to something like one-fourth of the present output in the United States, and that you believe you can represent to this committee that you will make it 33½ per cent cheaper and get it to the farmer 33½ per cent cheaper than it is now being gotten to the farmers in this country.

Mr. MAYO. Yes, sir.

Mr. HULL. Mr. Mayo, as I stated to you before, the big, compelling thing in this contract is in section 14:

"(b) To maintain nitrate plant No. 2 in its present state of readiness, or its equivalent, for immediate operation in the manufacture of materials necessary in time of war for the production of explosives."

I am not a lawyer and I may be wrong, but I think that the lawyers would say that that would be a condition that would have to go in the deed in order to make it binding on the company in the future. If the lawyers said that it was necessary, would there be any objection on your part or on the part of your company to placing that in the deed as a condition of the deed?

Mr. MAYO. I do not think there would be any objection.

Mr. GREENE. Following the replies you gave to Mr. Garrett, of course, as a business man you would not hold that your present statement as to the proportion of fertilizer that you could furnish would be likely to hold good through a century of development in this country?

Mr. MAYO. No, sir; you can not tell how the quantity would change. It would change with the processes.

Mr. GREENE. In other words, you may furnish 20 per cent of the total production of the country with the maximum output of this plant to-day if the base holds at the same figure of total production for the country, but if, as is quite probable, the country resorts more and more to intense fertilization as the century goes on, it would be more difficult for you to keep up the same relative proportion of fertilizer to the total, would it not?

Mr. MAYO. I do not think so; no.

Mr. GREENE. You think you can bring the capacity of that plant up to that proportion and maintain it?

Mr. MAYO. I am of the opinion that if the demand would require it Mr. Ford might possibly double up the plant.

Mr. GREENE. With the same power?

Mr. MAYO. Yes, sir.

Mr. GREENE. You think, then, that there is a reasonable expectation that you could hold to about the same relative production as compared with the total now?

Mr. MAYO. My opinion is that Mr. Ford has only stated his minimum amounts here.

Mr. GREENE. This morning Mr. Hill was inquiring about your interpretation of section 15, as to the right you had to the use of power after the expiration of the 100-year lease.

Mr. MAYO. Yes, sir.

Mr. GREENE. Mr. Hill suggested that in the century to come it was possible that the public policy of the United States might change with regard to the ownership of these natural resources and public utilities and things of that

kind and that we might adopt the policy of either owning or controlling all the water powers. In that case, what would you say of such a public policy that had already mortgaged the Government to give away certain power to one certain concern, no matter what the other demands of the other people and the other agencies throughout the country might be; the Government was held in perpetuity to give one certain concern, one certain power. Do you regard that as very good public policy?

Mr. MAYO. I do. I think it would be entirely unfair to Mr. Ford to have very extensive operations all built up to consume this power and then have it taken away from him.

Mr. GREENE. Mr. Ford is presumed, of course, in his own interests, to have so provided in this contract that he gets back what he puts in in the course of the century, but the Government is entirely a different proposition from an individual investor, because the Government is the guardian of the interests of the Nation as a whole for all time. I appreciate that this proposition is a matter somewhat close to your professional interests, and I do not want to ask any improper questions, but would you think, as a matter of public policy, this Nation, through its Government, should bind itself for all time, no matter what the future might develop as the necessary changes in public policy, so that one specific water power should always go to a certain identified concern?

Mr. MAYO. I think so, when that one concern was the means of building it up and bringing it into the condition it was or might be in at that time.

Mr. GREENE. Would that, then, justify the people who opened and owned and developed the coal mines to have a perpetual right to their use and their product even though the Government a century from now took over the operation of such public utilities?

Mr. MAYO. If the Government took over the Ford plant as well as the water power it would be quite another thing.

Mr. GREENE. I am simply suggesting, as I did yesterday, in questioning you, the possibility of tremendous revolutionary changes in public policy within the century. I dare say nobody here at this table or in this room now approves of the idea of public ownership and control of these natural resources, but we do know that it is quite within the possibilities, and it is already being urged and has been for a good many generations, for that matter, and a century might see a complete change. We are custodians of the property of the people of the United States, and to that extent the custodians of their future. Would we be justified in so tying up the future that our children's children back into several further degrees might not dispose of their own property because a dead hand had tied it up for them?

Mr. MAYO. I think the Government has every right to dispose of it as though this contract did not exist, in so far as price goes.

Mr. GREENE. I am not talking about price; I am talking about the actual control of the administration of the power. The price is immaterial to that.

Mr. MAYO. It plainly says, "Terms that may then be agreed upon."

Mr. GREENE. When people who are lawyers, and probably it is not necessary for me to say that I am not a lawyer—

Mr. MAYO. I am not, either.

Mr. GREENE. I am a layman and read this only as the English language would suggest and not as a lawyer would read it. It seems to me, as it did to my friend, Mr. Hill, this morning, that there are two statements in this paragraph which may be taken up separately and considered, and if the English language means what has been written down here, it does seem to me that upon the failure of a lease or a sale, Mr. Ford has the first right to the power that is developed there. The question of your coming to terms might be enforced by whatever court should decide the case, but he has a prescriptive right on that power.

Mr. MAYO. I think he should have all that he has asked for. I think a man who has the courage he has to make this offer, if he can make a successful run of this plant for 100 years and at that time hand this project back to the Government, cost free, practically, he should at least have a preferential right to get the power at the same going price that anybody else would get it.

Mr. GREENE. Now, Mr. Mayo, this question is suggested merely in our common interests as citizens.

Mr. MAYO. Yes; that is my personal opinion.

Mr. GREENE. And we are approaching it from that point of view. Mr. Ford and the public to-day may be well disposed toward one another, as doubtless

they are, and there may be great and immediate practical benefits to all the country in the Government accepting Mr. Ford's offer under present-day conditions. Those conditions may more or less continue throughout the generation and possibly the generation to follow, and yet Mr. Ford will be gone and all of these people who consent with us to-day to this contract are all gone and an entirely new economic and sociological situation confront their grandchildren, all within the century, because we are still a pioneering civilization in a continent which even physically is still being pioneered.

Now, all at once, those people are confronted with new economic conditions and with entirely new social relationships which perhaps we can not conceive, but we know that what we live in now is a tremendous advance over what our own grandfathers had on this very soil. Those people suddenly find that the policy of the Government is to administer these natural resources and these public utilities in its own hands, and it may do so with respect to all the water power in the land except one, and that one is bound up in the hands of this company.

Mr. MAYO. I do not agree with you on that, because there are a number of other water powers with perpetual rights.

Mr. GREENE. But they are now in private ownership.

Mr. MAYO. Yea.

Mr. GREENE. I am speaking about the water powers that Uncle Sam owns and controls.

Mr. MAYO. Yes.

Mr. GREENE. Would you think, as a matter of public policy, it was desirable notwithstanding the immediate benefits to be gained by this arrangement, which I am not arguing at all, or the benefits perhaps for a generation or two, still, as a matter of public policy, do you think we should commit the Government beyond the lifetime of three generations and beyond a century—in perpetuity?

Mr. MAYO. Well, I will come back to my former statement and say that if the development is such at the expiration of 100 years the company is consuming all the power (and, of course, it only has a chance to get what it does consume on an average during the last 10 years), and if the conditions are such, for the sake of the argument, that a vast investment had been made, nothing should happen to take that power away from the plants and wreck that big development.

Mr. GREENE. I think I will not prolong the discussion of the matter, because it is simply a question, you realize, that will be dwelt upon from the very nature of things by and by, and I think the people will be more likely, if you will permit me, Mr. Mayo, to regard it as a matter of principle rather than a confusion of identities and property interests. It does not make any difference who did own it or the antecedents of the owner, the presumption is that if this is a reasonably successful business speculation or investment, it will have repaid for itself several times, so that the people who may own this power 100 years from now will have made no original outlay from their own pockets and will have nothing to recoup themselves for on account of the original investment because that will have been paid back long, long before.

Mr. MAYO. Yes, that may all be true, yet it might be that at that very period when there might be a new set of owners who have had their money invested only a few years.

Mr. GREENE. Exactly; and the people who conceived this thing, assuming that Mr. Ford should carry out his original intention, would be gathered to their fathers many, many decades, and the people who come on later do not partake of the original, personal element engaged in this thing at all, but are mere automatic heirs in some way, either by law or by birth and descent, of certain property, which they never had a part in forming, and they find that they can stand out against the whole Government of the United States with a prescriptive right that no power on earth can take away from them in the use of certain water power; is that your interpretation?

Mr. MAYO. I think you put it in more or less of an arbitrary light. A great deal of thought was given in drawing that particular paragraph, and it was tried to be drawn in a fair form. The line of thought that was used was that this project can not continue without being successful, and if so, it should be a continually growing one, and if so, it should finally absorb all the power, and a contract should never be so drawn that some day, no matter when, somebody should be able to cut its feet right out from under it by robbing it of all its

Mr. MAYO. It is to show the intent of what we are trying to do.

Mr. FIELDS. This article 17 that has been discussed was prepared by or submitted to you by the Judge Advocate General's Department, was it not? It was prepared by the Judge Advocate General's Department and the representatives of Mr. Ford?

Mr. MAYO. Yes, sir; that is, they took our offer and revised it.

Mr. FIELDS. And this is the revised form as it came from the Judge Advocate General's Department?

Mr. MAYO. Yes, sir.

Mr. FIELDS. Returning to the question of the probability or the possibility of Mr. Ford discontinuing the manufacture of fertilizer if he should find it was unprofitable—he could not discontinue the production of fertilizer by just locking up the shop and quitting, could he?

Mr. MAYO. No, sir.

Mr. FIELDS. Would he not have to make a showing to the proper authorities and get the necessary relief?

Mr. MAYO. Yes, sir.

Mr. FIELDS. That is your understanding?

Mr. MAYO. Yes, sir; that is my understanding.

Mr. FIELDS. I desire to ask you, Mr. Mayo, if Mr. Ford or his representatives, or both, discussed this contract as now before us with Mr. Weeks, the Secretary of War?

Mr. MAYO. Several times; yes, sir.

Mr. FIELDS. Is it your opinion that Mr. Ford emphasized the fact to Mr. Weeks that this is his proposition or was as far as he could go toward meeting his demands.

Mr. MAYO. Yes, sir.

Mr. JAMES. Mr. Mayo, how much money do you expect Mr. Ford will put into this fertilizer plant?

Mr. MAYO. My opinion is it will keep increasing from time to time.

Mr. JAMES. About how much?

Mr. MAYO. To start with?

Mr. JAMES. Yes; to start with.

Mr. MAYO. My guess is that it would amount to some \$5,000,000.

Mr. JAMES. How many tons of fertilizer per annum do you think Mr. Ford will distribute to the farmers?

Mr. MAYO. It depends on the kind of fertilizer you make to start with, which, of course, controls the capacity of the plant.

Mr. JAMES. Well, about how much?

Mr. MAYO. I can only answer that by saying the equivalent of 110,000 tons of ammonium nitrate.

Mr. JAMES. About how many tons approximately will that make?

Mr. MAYO. As we said before, almost 2,000,000 tons of complete fertilizer—say a 2-8-2 mixture.

Mr. JAMES. Under the proposition submitted by Mr. Ford, what is the least amount in number of tons of fertilizer that Mr. Ford is bound to manufacture?

Mr. MAYO. What is the least number of tons?

Mr. JAMES. Yes.

Mr. MAYO. That would be the amount, if it was made as it is made at present by other fertilizer manufacturers.

Mr. JAMES. About how many tons under this contract?

Mr. MAYO. Approximately 2,000,000 tons.

Mr. JAMES. Mr. Ford binds himself under this contract to produce the equivalent of 2,000,000 tons of fertilizer per year?

Mr. MAYO. No, sir.

Mr. JAMES. How many tons does he bind himself under his contract?

Mr. MAYO. That all depends on the mixture and whether you carry a filler or not.

Mr. JAMES. About how many; the least number of tons?

Mr. MAYO. In my judgment it would run from a minimum of possibly 200,000 tons up to a maximum of about 2,000,000 tons, depending upon the class of fertilizer, whether it carried a filler or not, and the proportion it did carry, if any.

Mr. JAMES. You consider that under the contract the least number of tons that Mr. Ford would manufacture would be 200,000 tons?

Mr. MAYO. I think so; yes, sir; that is, of sulphate.

Mr. JAMES. What section of the contract is that in? Where you bind yourselves to produce at least a minimum of at least 200,000 tons.

Mr. MAYO. It is in section 14.

Mr. JAMES. What is the language?

Mr. MAYO. That is the equivalent of 110,000 tons of ammonium nitrate annually, "said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum."

Mr. JAMES. That would not bind him to produce fertilizer; that is the equivalent to be used for that purpose.

Mr. MAYO. Fertilizer equivalent to that amount. That is expressed in that manner because the plant was built originally to make ammonium nitrate, and that is based on the amount of nitrogen the plant would produce.

Mr. JAMES. Is there any objection to our making an amendment in the offer providing, in effect, that Mr. Ford guarantees to produce at least 200,000 tons a year?

Mr. MAYO. I think he does guarantee that. I think the present form of guaranty is the best form you can get in there.

Mr. JAMES. Will he object to our rewriting that so that it will be positive that there is a guaranty?

Mr. MAYO. I do not think there would be any objection if it carried out the intent of that paragraph.

Mr. JAMES. It is the intent of Mr. Ford to produce fertilizer itself? Under the terms of the contract there is not any guaranty that general fertilizer will be manufactured.

Mr. MAYO. Oh, yes.

Mr. JAMES. What is the language?

Mr. MAYO. In the production of nitrogen and other fertilizer compounds.

Mr. JAMES. That is not fertilizer, is it?

Mr. MAYO. You do not mean to say it is not a fertilizer; it is not complete fertilizer.

Mr. JAMES. Mr. Ford's proposition, you have said, is that he expects to distribute this fertilizer himself to the farmers through an agency he will create having the fertilizer ready for use?

Mr. MAYO. Yes; I do not think he would have any objection to clarifying the language so that it would mean complete fertilizer.

Mr. MILLER. Mr. Mayo, are we to understand from you that we are to assure our colleagues on the floor of the House that Mr. Ford agrees to make a commercial fertilizer, irrespective of the cost, through the life of the lease, or are we to impart to our colleagues on the floor of the House the information that he is only to produce it if he can produce it profitably?

Mr. MAYO. The only provision that would let him out of having to make it would be the exhausting of every known effort.

Mr. MILLER. Your proposition has this absolutely binding language, without any exceptions or qualifications: "That company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control." Now, we are getting in there a very important exception, providing he can make it at a profit.

Mr. MAYO. That paragraph is there, and it can stand.

Mr. MILLER. Then if that paragraph means what it says it is unequivocally, without any condition whatever, providing that Mr. Ford is to operate nitrate plant No. 2 and put out 110,000 tons of ammonium nitrate, which is a fertilizer element, during every year of the lease period of the 100 years.

Mr. MAYO. He is willing to stand by the paragraph that is there.

Mr. MILLER. Then it is without any equivocation, condition, or exception as to whether it would be a paying proposition or not.

Mr. MAYO. I do not think so.

Mr. MILLER. What does that mean, that he does not have to do it?

Mr. MAYO. In my opinion, he would not have to do it, as I have said before, if he exhausted every known effort, and still could not make it except at a great loss.

Mr. MILLER. He can make it whether he makes it at a loss or not, can he not?

Mr. MAYO. I do not think he could do it very long.

Mr. MILLER. That is like the story of the old clothier who sold goods at a low cost because he sold so many of them. You can make this fertilizer just as well if you make money out of the proposition, or if you can not, so far as the physical manufacture is concerned, but when you approach it from a

financial angle, it is not wholly impossible even from that angle. What we are after is to assure our colleagues on the floor of the House that Mr. Ford's company agrees unequivocally and without condition throughout the time of the lease to produce yearly at that plant 110,000 tons of ammonium nitrate.

Mr. MAYO. It does not seem to me it would be good judgment to try to pass that sort of an idea along. You can not expect the impossible of him. I can best answer the question by saying that he is willing to let the paragraph stand as it is.

Mr. MILLER. Without any condition attached to it. I observed the statement you filed when Mr. Stoll asked you a question. Did you prepare that statement?

Mr. MAYO. Yes; Mr. Waldo and myself together prepared it.

Mr. MILLER. I would like to analyze it because I heard it and I am much interested in it.

Mr. MAYO. That is what it was made for.

Mr. MILLER. Mr. Mayo, how much will be the aggregate amount you will pay in on your amortization fund during the lifetime of your lease? You pay \$46,746 a year, do you not? You pay \$19,868 on Dam No. 2, semiannually, and you pay \$3,505 on Dam No. 3, semiannually.

Mr. MAYO. I think that is right; yes, sir.

Mr. MILLER. So you pay \$46,746 per year. The period of your lease is 100 years.

Mr. MAYO. Yes, sir.

Mr. MILLER. If you multiply that amount by 100 you will get how much?

Mr. MAYO. It is approximately four and a half million dollars.

Mr. MILLER. All you pay for your amortization fund for the 100 years is \$4,670,600, is it not? You were speaking of the investment of the Government gradually being decreased.

Mr. MAYO. Yes, sir.

Mr. MILLER. In your statement you referred to that. It will be decreased \$46,746 a year on a \$42,000,000 investment?

Mr. MAYO. Plus the interest?

Mr. MILLER. Plus what interest?

Mr. MAYO. Plus the interest it makes.

Mr. MILLER. Do not compound against the Government. You are compounding against the Government.

Mr. MAYO. I think not; no, sir.

Mr. MILLER. The straight interest you will pay is \$46,746 a year for that period?

Mr. MAYO. That is not interest; that is the retirement fund.

Mr. MILLER. Or the amortization fund. That is what I am speaking about.

Mr. MAYO. To be put out at interest.

Mr. MILLER. Yes; but you said it would decrease the amount so much.

Mr. MAYO. I say so again.

Mr. MILLER. It will decrease it \$46,746 a year, will it not?

Mr. MAYO. And plus the interest.

Mr. MILLER. If you place that out at compound interest and compound it against the Government, it will amount to \$49,000,000 at the expiration of your lease, will it not?

Mr. MAYO. I do not understand the language you use when you say "against the Government."

Mr. MILLER. You are getting the benefit of that compound interest if you amortize this proposition.

Mr. MAYO. Certainly.

Mr. MILLER. And the compounding is against the Government.

Mr. MAYO. I do not so understand it.

Mr. MILLER. It is not against you, is it? You are getting the benefit of it. are you not?

Mr. MAYO. But the Government gets the money.

Mr. MILLER. You are getting the benefit of the compound interest in figuring your amortization fund, are you not?

Mr. MAYO. So is the Government.

Mr. MILLER. I say you are getting the benefit of that?

Mr. MAYO. I am saying so is the Government.

Mr. MILLER. Then, if the Government has that amortization fund equal to the cost of the dam, it is compounding it against itself; there can not be any other interpretation to it.

Mr. MAYO. I can not see it; I may be dense.

Mr. QUIN. Mr. Mayo, the Government is in this business of loaning money to the farmers through the Farm Loan Board, is it not?

Mr. MAYO. So I understand.

Mr. QUIN. Then, this money you pay this Government as a rental or for amortization could ordinarily be loaned to the farmers at 5 per cent. could it not?

Mr. MAYO. I expect so.

Mr. QUIN. They are now crying for money, and the banks can not let them have it. There would be no trouble about investing the funds, would there, after it was paid in?

Mr. MAYO. I do not think so.

Mr. PARKER. Mr. Mayo, referring again to this question of being unable to manufacture profitably, no matter how hard you might try, I find that section 14 says that the company shall operate "except as it may be prevented by strikes, accidents, fires, or other causes beyond its control." Do you mean to say you consider its inability to manufacture profitably a cause beyond its control?

Mr. MAYO. I am not a lawyer, but that is a usual phrase in usual commercial contracts. Mr. Ford stands by that paragraph and is willing to take the consequences.

Mr. PARKER. I again ask the question: Do you consider the inability to manufacture profitably a cause beyond the company's control, under that clause?

Mr. MAYO. I can not definitely say.

Mr. PARKER. It is a very common thing, I believe, to have construction contracts on which money is paid out from time to time to the contractors and the whole thing is funded when the construction is done.

Mr. MAYO. Yes.

Mr. PARKER. Is it not universal that interest is allowed on the moneys paid out in construction when the funding is done and included in the funding?

Mr. MAYO. It all depends on the arrangement.

Mr. PARKER. Is not that the ordinary arrangement?

Mr. MAYO. Well—

Mr. PARKER (interposing). It is to be paid out of a fund in the end?

Mr. MAYO. It is to be paid out of something.

Mr. PARKER. Under those circumstances, interest has to be added upon the amounts paid upon the initial construction?

Mr. MAYO. Yes, sir.

Mr. PARKER. Have you built dams in a limestone country?

Mr. MAYO. We have built small dams in our country, which is a limestone country.

Mr. PARKER. You know the dangers of a dam being undermined? Especially in a limestone country, with hidden channels forming under the limestone.

Mr. MAYO. I think that trouble is liable to occur at the start, if at all.

Mr. PARKER. You do not think it is liable to occur during the hundred years?

Mr. MAYO. I do not think so.

Mr. PARKER. If during the hundred years floods or an earthquake should destroy that dam the Government would have to replace the dam without getting a thing for that security?

Mr. MAYO. Yes, sir.

Mr. HILL. I have just one question I want to ask you, Mr. Mayo, in reference to paragraph 14. If Mr. Ford's company should produce annually 110,000 tons of ammonium nitrate, that would be in full compliance with the contract, would it not?

Mr. MAYO. It is not proposed to make ammonium nitrate at all, as such. That is not a fertilizer ingredient.

Mr. HILL. Let us put it in another way. If Mr. Ford's plant should produce annually nitrogen or other fertilizer compounds equivalent to 110,000 tons of ammonium nitrate per annum, that would be in full compliance with the contract, would it not?

Mr. MAYO. I would say so.

The CHAIRMAN. We are very much obliged to you, Mr. Mayo. You have given us a great deal of very enlightening information.

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Tuesday, February 14, 1922.

STATEMENT OF DR. RICHARD C. TOLMAN, DIRECTOR FIXED NITROGEN RESEARCH LABORATORY, DEPARTMENT OF AGRICULTURE.

Dr. Tolman. Mr. Chairman, I represent the fixed nitrogen research laboratory of the Department of Agriculture. We have carried out a large number of investigations as to the best methods of utilizing the Muscle Shoals plant for the manufacture of fertilizer, and I shall be glad to make a statement, if you desire, concerning the kinds of material that can now be manufactured at that plant, the kinds of material that could be manufactured in the future or might be manufactured in the future; then I would like to make a tentative statement as to the commercial possibilities; and then I have an authorized statement from the Secretary of Agriculture as to the attitude of the Department of Agriculture toward the Ford proposition.

The CHAIRMAN. You may proceed in your own way to discuss these questions.

Dr. Tolman. The Muscle Shoals plant is now designed to produce two materials, it is designed to produce 220,000 tons of cyanamid per annum, which is later transformed into ammonium nitrate, amounting to 110,000 tons, as the final product of the plant. I have here a chart which shows the stages by which this transformation of nitrogen is carried out. This particular line [indicating on chart] represents the raw materials which come into the process, air, limestone, coke, and a certain amount of coal for drying and heating purposes, and power, which might come either from the Wilson Dam or from the steam power plant. The final product which the plant now makes is ammonium nitrate, which was to be used, mixed with T. N. T., in explosives, and that is represented by this pile of material here. The size of the pile represents the approximate daily tonnage.

Besides this final product, ammonium nitrate, which is now the product that the plant is designed to make, it can make a variety of other products. If the committee desires, I can tell you briefly about the different possibilities as to what the plant might make as well as ammonium nitrate.

The first material is ammonium sulphate, and that would be made from the ammonia by setting up sulphuric acid units which were shipped from the Old Hickory plant to make that material. Another product, in the making of which we would employ phosphoric acid, would be ammonium phosphate. Another product which could be made there by a method which we have worked out at the fixed nitrogen research laboratory is urea. Then we have ammonium nitrate, which might well be made in certain quantities even during peace time, because it is used in peace time in permissible explosives and might work to some extent into fertilizer products.

The CHAIRMAN. What is urea used for?

Dr. Tolman. That material is manufactured at the present time in Germany and has been manufactured to some extent in this country. It is used at the present time, in the largest quantities, as a stabilizer for celluloid, and because of the size of the moving picture industry considerable quantities of urea are used for that purpose. It is our belief that this material is being imported from Germany. We have tried to work out at our laboratory a process for this material which we believe is somewhat similar to the process used in Germany, although we believe we have some improvements over the process used by the Germans.

I have here a number of small bottles containing some samples of these chemicals which the members of the committee may examine at their leisure.

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Tuesday, February 14, 1922.

STATEMENT OF DR. RICHARD C. TOLMAN, DIRECTOR FIXED NITROGEN RESEARCH LABORATORY, DEPARTMENT OF AGRICULTURE.

Dr. Tolman. Mr. Chairman, I represent the fixed nitrogen research laboratory of the Department of Agriculture. We have carried out a large number of investigations as to the best methods of utilizing the Muscle Shoals plant for the manufacture of fertilizer, and I shall be glad to make a statement, if you desire, concerning the kinds of material that can now be manufactured at that plant, the kinds of material that could be manufactured in the future or might be manufactured in the future; then I would like to make a tentative statement as to the commercial possibilities; and then I have an authorized statement from the Secretary of Agriculture as to the attitude of the Department of Agriculture toward the Ford proposition.

The CHAIRMAN. You may proceed in your own way to discuss these questions.

Dr. Tolman. The Muscle Shoals plant is now designed to produce two materials. It is designed to produce 220,000 tons of cyanamid per annum, which is later transformed into ammonium nitrate, amounting to 110,000 tons, as the final product of the plant. I have here a chart which shows the stages by which this transformation of nitrogen is carried out. This particular line [indicating on chart] represents the raw materials which come into the process, air, limestone, coke, and a certain amount of coal for drying and heating purposes, and power, which might come either from the Wilson Dam or from the steam power plant. The final product which the plant now makes is ammonium nitrate, which was to be used, mixed with T. N. T., in explosives, and that is represented by this pile of material here. The size of the pile represents the approximate daily tonnage.

Besides this final product, ammonium nitrate, which is now the product that the plant is designed to make, it can make a variety of other products. If the committee desires, I can tell you briefly about the different possibilities as to what the plant might make as well as ammonium nitrate.

The first material is ammonium sulphate, and that would be made from the ammonia by setting up sulphuric acid units which were shipped from the Old Hickory plant to make that material. Another product, in the making of which we would employ phosphoric acid, would be ammonium phosphate. Another product which could be made there by a method which we have worked out at the fixed nitrogen research laboratory is urea. Then we have ammonium nitrate, which might well be made in certain quantities even during peace time, because it is used in peace time in permissible explosives and might work to some extent into fertilizer products.

The CHAIRMAN. What is urea used for?

Dr. Tolman. That material is manufactured at the present time in Germany and has been manufactured to some extent in this country. It is used at the present time, in the largest quantities, as a stabilizer for celluloid, and because of the size of the moving picture industry considerable quantities of urea are used for that purpose. It is our belief that this material is being imported from Germany. We have tried to work out at our laboratory a process for this material which we believe is somewhat similar to the process used in Germany, although we believe we have some improvements over the process used by the Germans.

I have here a number of small bottles containing some samples of these chemicals which the members of the committee may examine at their leisure.

The main problem with ammonium nitrate as a fertilized compound is that although it is an excellent plant food, nevertheless it is a very deliquescent substance, in other words, it picks up water. We have made a number of experiments in regard to the various possibilities of ammonium nitrate as a useful component of fertilizer products. We have gotten up methods for graining and oil coating the ammonium nitrate, and you might sell it in that form. We have also experimented with a compound of ammonium sulphate and ammonium nitrate, which is a double salt. This double salt is less deliquescent than the ammonium nitrate, although not perhaps entirely satisfactory. Another method is to take potassium chloride and mix it with ammonium nitrate. The two salts react together to form a mixture which is nondeliquescent, and that material contains two substances which are useful in fertilizer, and which are used in fertilizer practice. Still another method is to mix ammonium nitrate and potassium sulphate together.

Mr. QUIN. I would like to know the meaning of that term, nondeliquescent.

Dr. TOLMAN. A deliquescent salt or material, is a material which, when exposed to the air will pick up water and become so moist that you can not use it in a fertilizer because it makes the fertilizer cake. I have here a sample of ammonium nitrate and if you expose that material it will take up moisture.

This pile on the chart represents a certain daily production of cyanamid fertilizer. That is made from the first product that is produced, namely, cyanamid, by hydrating and oil coating it. It is a material which is already used to some extent in fertilizer practice. The capacity of the American Cyanamid Co. at Niagara Falls is believed to be 64,000 tons per annum, and it is believed that the largest quantity of cyanamid used in a single year in America was in the neighborhood of 40,000 tons.

The CHAIRMAN. When was that?

Dr. TOLMAN. That was before the war; the exact year I do not remember. The figures were stated by the company.

Since the total capacity of this plant in the form of cyanamid, which is the cheapest form of nitrogen, which it produces, would be 220,000 tons, it is not believed that any large proportion of the product of the plant could be sold as cyanamid. The material can not be used in mixed fertilizers in large amounts, for the following reasons: If used in large amounts it reacts with the acid phosphate to destroy its availability and it is also liable to produce dicyanodiamide, which is a poisonous substance to plant life. It can, however, be used in quantities of about 50 pounds to the ton of mixed fertilizer, but that would not absorb anywhere near the whole production.

We have made experiments which show that it can be more successfully mixed with basic phosphate, a material now produced by the Tennessee Coal & Iron Railroad Co. in Birmingham, and that it can be mixed with Thomas slag, a material which has been imported from Europe, and that it can be mixed with calcined phosphate, a new material which is not yet on the market.

This small building with the string of bottles is a plant where we think special chemicals should be manufactured. Nitrogen, when mixed in the form of cyanamid, is combined directly with the carbon atom, and that leads to the possibility of the production of a variety of chemicals which could not be produced by other methods of nitrogen fixation, and we believe the plant could produce quite a variety of organic chemicals.

The CHAIRMAN. That is what is being produced at the present time?

Dr. TOLMAN. The plant at the present time is shut down.

The CHAIRMAN. Or it could be produced at the plant if it were put into operation?

Dr. TOLMAN. The plant as it now stands is a real plant. One year after they started breaking ground their first product came through, but the plant as it stands will only manufacture as its final product, ammonium nitrate.

Additions to the plant would have to be made in varying amounts to manufacture this variety of products. Some of the additions would be relatively unimportant, such as putting in hydrating and oiling equipment for treating the cyanamid. To put in phosphoric-acid furnaces to make the ammonium phosphate would be more expensive. Those are some of the possibilities for the future.

I have a set of samples showing the different stages in the process, a set showing the various fertilizer materials which could be manufactured, and a set of samples of the special chemicals. I will not stop to explain these unless the committee desires me to do so.

The CHAIRMAN. You might explain that.

Dr. TOLMAN. This first case shows the stages of the process as now designed to be used at Muscle Shoals. You start with limestone, and coke, and nitrogen as your raw materials. You burn the limestone to form burnt lime and mix it with the coke and make calcium carbide. That is then ground up and put into a furnace through which nitrogen is passed, and you get your material which is called lime-nitrogen pig. Your other steps continue until you get the present product now made there, which is ammonium nitrate. If instead of treating your ammonia with nitric acid you treated it with sulphuric acid you will get ammonium sulphate.

Then I have here another case which shows a considerable variety of fertilizer materials which could be made with various additions to the plant. These are the varieties of the materials which could be made and I will leave these here with the committee. Here, for instance, is cyanamid mixed with calcined phosphate. That is a form of phosphate which could be successfully mixed with cyanamid, and here is the mixed salt that could be made from ammonium nitrate and potassium chloride. That would be a satisfactory material.

This case shows you some special chemicals which can be made with the help of nitrogen in the cyanamid form. There are only two substances which I would like to call special attention to.

One is nitroguanidine, which is a substance that the Ordnance Department is now experimenting with as a constituent of smokeless powder. Nitroguanidine can only be obtained from nitrogen in the cyanamid form. It is believed that there is a considerable possibility that nitroguanidine will be an important constituent of smokeless powder in the future. It was used by the Germans to some extent during the war. At the present time the only place on this continent where you can get the material to make nitroguanidine is the plant of the American Cyanamid Co. at Niagara Falls, Canada. If the smokeless powder used in the future should contain 50 per cent of nitroguanidine, which is perhaps an upper limit, the amount necessary to keep 100 divisions in the field per annum would be far larger than the total output possible at the Muscle Shoals plant. The reason why this material is a desirable substance for smokeless powder is because it has a high explosive force, and yet explodes with a very low temperature rise, is a pure chemical substance, and is nondeliquescent. In smokeless powder made out of nitrocellulose the character of the smokeless powder will depend to some extent on the character of the cotton. Nitrocellulose is not nondeliquescent and is not as dependable a substance as a pure chemical.

Another substance is veronal, a material used in sleeping tablets and that is also manufactured by using cyanamid.

Turning now to the value of the fertilizer compounds which could be made at Muscle Shoals, these are merely samples showing experiments which have been made. I have quite a number here. For instance, this photograph [indicating photograph] shows the yield of corn without any fertilizer being used, and this photograph [indicating photograph] shows the yield of corn when there were 80 pounds of phosphoric acid and 40 pounds of potash used to the acre. The yield has gone up. In this case [indicating photograph] nitrogen was used as well as phosphate and potash. Here [indicating photograph] 40 pounds of ammonia were supplied in the form of cyanamid.

The CHAIRMAN. Let me ask you a question right there. In the first basket, which is overflowing, was there no fertilizer used?

Dr. TOLMAN. No fertilizer was applied.

Mr. GARRETT. What was the percentage of increase there?

Dr. TOLMAN. This yield was 33.6 bushels of corn per acre without fertilizer, this one was 40.4 bushels, obtained by the use of phosphate and potash, and this one was 48.6 bushels, obtained by the use of phosphate, potash, and 40 pounds of ammonia to the acre in the form of cyanamid [indicating respective photographs]. These were experiments which we carried out at Muscle Shoals.

(At this point the witness exhibited a number of other photographs showing the increased yield of corn and cotton obtained by the use of nitrogen.)

Dr. TOLMAN. Mr. Chairman, I would like to try to make a tentative statement as to the possibilities of commercial success in the operation of the Muscle Shoals plant for the production of commercial fertilizer. You realize this is a difficult field because it is trying to make predictions with regard to the future. This is the way that the fixed nitrogen research laboratory feels about the possibilities there.

With ammonium sulphate at its present market price, in the neighborhood of \$50 a ton, if the Muscle Shoals plant is to be run commercially to produce ammonium sulphate as its main product, the plant can not be run and made to pay expenses.

If you regard the Muscle Shoals plant as mainly producing ammonium sulphate, then with the price of ammonium sulphate at \$65 a ton, the fixed nitrogen research laboratory feels that the plant can just about pay expenses, and perhaps make a little profit, provided whoever runs the plant charges himself with a low enough figure for the water power which he uses, and does not make his capital charges too high. You might about break even, with ammonium sulphate selling at \$65 a ton, if you charge yourself for power about three-quarters of a mill per kilowatt hour and do not take your capital charges on a sum larger than five or ten million dollars. I have to say these are our best guesses, because you can not make precise predictions in a field of this kind.

I would also like to make a statement as to the possibilities of the Muscle Shoals plant if you do not make ammonium sulphate your main product. If you go ahead and develop a plant for a variety of materials, including ammonium nitrate, ammonium phosphate, urea and special chemicals of various kinds, under these circumstances, I think the plant can be made a commercial success, provided the man who obtains the plant surrounds himself with the proper chemical and scientific talent.

The CHAIRMAN. You spoke about having an authorized statement from the Secretary of Agriculture.

Dr. TOLMAN. Yes, sir.

The CHAIRMAN. Are you ready to give that to us?

Dr. TOLMAN. Yes, sir; I have just reached that point. I have the authority of the Secretary of Agriculture to present the following statement:

"The Department of Agriculture believes that the farmers of the United States would be benefited by the operation of the Muscle Shoals plant to produce fixed nitrogen for use in fertilizers.

"The department understands that Congress has already decided against the operation of this plant by a Government-owned corporation, and that operation must be by a private individual or corporation.

"The department has collected a great deal of information as to the utilization of the plant and as to the possibilities for its future development, and stands ready to cooperate to the fullest extent possible with any agency which may secure the plant.

"Concerning the Ford proposal, if its terms are sufficiently definite and binding to make sure that the plant will be operated continuously for the manufacture of fertilizer, the department looks with favor upon its acceptance, believing that it will result in making available a considerably increased supply of fertilizer in time of peace and give us assurance of adequate supplies of explosives in case of need. The department does not undertake to pass upon the terms of the contract, or venture an opinion as to whether they are sufficiently definite and enforceable to guarantee the continuous manufacture of fertilizer."

Mr. CROWTHER. I would like to ask one question. Is there any opportunity for the production of nitrates at plant No. 1 which proved a failure?

Dr. TOLMAN. Yes, sir.

Mr. CROWTHER. That is a possibility?

Dr. TOLMAN. Do you mean the plant or the process?

Mr. CROWTHER. The process.

Dr. TOLMAN. The Haber process. I should like to say that I believe the Haber process is a very important one.

Mr. CROWTHER. There is quite a plant there, is there not, that cost about \$13,000,000?

Dr. TOLMAN. Quite a plant, but it is not at all on the same scale that plant No. 2 is on, and is not yet successfully developed.

Mr. CROWTHER. Do you think that would be the plant that Mr. Ford refers to in connection with experimentation and further production?

Dr. TOLMAN. I believe it would be very important to carry out further experimentation on the method of fixing nitrogen by the Haber process. In fact, there are many people who believe the Haber process will replace the cyanamid process. There is already more capacity for nitrogen fixation in Germany by the Haber process than by the cyanamid process.

Mr. CROWTHER. I do not understand that this contract binds Mr. Ford to undertake that in plant No. 1; his specification is confined to plant No. 2 entirely.

Dr. **TOLMAN**. Yes, sir.

We have carried out a considerable number of investigations at our laboratory on the Haber process. The main step of that process is to obtain a catalyst which will cause the union of the nitrogen and hydrogen to form ammonia. This is a sample of our catalyst, which we know is superior to any catalyst in America, and we believe it is superior to any in the world. It produces 16 per cent ammonia at 100 atmospheres, while the Germans were getting in their plant about 5 per cent ammonia at the time of the armistice.

The **CHAIRMAN**. There was an explosion in the German plant about a year ago.

Dr. **TOLMAN**. There was an explosion at one of the two German plants that use the Haber process, the smaller of the two that use that process.

The **CHAIRMAN**. The loss of life in that explosion was something terrific.

Dr. **TOLMAN**. I believe so.

The **CHAIRMAN**. I think our newspapers went on to say there were about 6,000 people injured and killed in that explosion. Would you consider that a safe process?

Dr. **TOLMAN**. We do not know what it was that exploded at the plant. A committee has just been formed in this country at the call of the president of the National Academy to undertake an investigation of the explosibility of the substances involved at that plant, and we have not yet received sufficient information to tell what the causes of the explosion were. Until we get that information I think in any case it would not be wise to condemn the Haber process. I feel sure it can be operated with reasonable safety.

The **CHAIRMAN**. There is one other company that is using that process at the present time in Germany, but it is a comparatively small company, is it not?

Dr. **TOLMAN**. No; it is my understanding that both plants are owned by the same company and the one which did not explode at Merseburg is much the larger of the two. The Oppau plant was the smaller of the two. It was nearer the allied lines, and is within the territory taken at the time of the armistice.

The **CHAIRMAN**. I was of the impression that the plant which did not explode was the smaller of the two.

Dr. **TOLMAN**. I think it is the other way around.

Mr. **PARKER**. The Haber process is used by the Syracuse plant?

Dr. **TOLMAN**. At Syracuse, I believe, they are making about 12 tons of ammonia a day by the Haber process.

Mr. **GREENE**. Speaking of processes, Dr. Tolman, these questions which follow will be those of a layman. I do not understand the chemistry of this business, but I would like to get a little information in regard to the general principles. It is reasonable to assume that you chemists of agriculture have pretty well established what might be regarded as standard definite formulæ for the future regarding the necessities of the soil in the way of fertilizer.

Dr. **TOLMAN**. Prof. Whitney, of the Bureau of Soils, is here to testify and he is qualified to speak on subjects of that kind. I am a chemist and not an agronomist or a water power expert and I can not answer that question, or questions in regard to the agricultural use of fertilizers in general, or questions in regard to water power.

Mr. **GREENE**. You have made some reference to a term which is comparatively new to most of us; that is to say, urea. What is the percentage of nitrate in that?

Dr. **TOLMAN**. Forty-six and six-tenths per cent nitrogen.

Mr. **GREENE**. How does that compare with the ingredients now commercially employed?

Dr. **TOLMAN**. It is very much higher. It has a very much higher content of nitrogen than any in the substances now used in fertilizer practice.

Mr. **GREENE**. Approximately, what will be the difference in the percentage?

Dr. **TOLMAN**. In ammonium sulphate the percentage is 21.2. In the Chile nitrate the percentage of nitrogen is 15.7; that is, 95 per cent pure Chilean nitrate.

Mr. **GREENE**. Then it is the recommendation of you people who have made experiments with these things that any process or formula that makes for the development of this more highly concentrated form like urea is an advantage?

Dr. **TOLMAN**. I would say they have certain advantages, but I would not like to see anything done which would crowd out of the fertilizer market certain low-

grade materials which have a definite economic place in the market at the present time.

Mr. GREENE. That would have its peculiar trade advantages?

Dr. TOLMAN. It would have advantages in the case of shipping from place to place.

Mr. STOLL. How many tons of ammonium sulphate can be gotten from the 110,000 tons of the nitrate you would produce at Muscle Shoals?

Dr. TOLMAN. If we were going to make ammonium sulphate there we would not make ammonium nitrate. The total capacity of that plant for making ammonium sulphate would be in the neighborhood of 190,000 tons.

Mr. STOLL. That is in the shape of a fertilizer ingredient.

Dr. TOLMAN. Ammonium sulphate is a material which is now used in standard fertilizer practice.

Mr. STOLL. In what other forms do you use ammonia in the sulphate?

Dr. TOLMAN. Nitrate of ammonia—

Mr. STOLL (interposing). Ammonia for fertilizer?

Dr. TOLMAN. We consider fertilizer nitrogen as so much ammonia, even though the nitrogen is not contained in the exact form of ammonia. We speak of the organic ammoniates, such as dried blood, fish scrap, and garbage tankage, etc. We speak of it as containing so much ammonia.

Mr. STOLL. Is ammonia a scarce element, hard to get?

Dr. TOLMAN. There are at the present time two main sources of ammonia—from coke-oven by-product recovery and from city gas manufacture. The coke-oven by-product recovery is much the larger of the two.

Mr. STOLL. Those are the only sources we have now?

Dr. TOLMAN. Except the Muscle Shoals plant and other nitrogen-fixation plants.

Mr. STOLL. Through the air or from the coke ovens?

Dr. TOLMAN. Either through the air or from the coke ovens, and a small amount from gas manufacture for city gas.

Mr. STOLL. Do you know the amount that is being made from coke ovens and from gas?

Dr. TOLMAN. Prof. Whitney can tell you about that.

Mr. HULL. Doctor, I judge from your answer to a question asked you some time ago that you think we should have something specific in the contract we make with Mr. Ford in order to protect the people in regard to overcapitalization on increased overhead in this proposition, in order to make a success of the commercial production of fertilizer; is that true?

Dr. TOLMAN. I do not think that is quite what I said.

Mr. HULL. I know you did not say it, but you suggested it.

Dr. TOLMAN. I think what I said was that you could not manufacture sulphate there at a profit if you charged yourself too large a quantity for the water power and too much for the working capital which you put into the business. With regard to the form of the contract which the Congress should require I have no suggestions to make, because that is entirely outside of my field.

Mr. HULL. You spoke of the Government having decided not to develop it as a Government proposition. You would not recommend that, would you? You are acquainted with the difficulties we would confront if we undertook to do that?

Dr. TOLMAN. I think it would be very difficult to operate the plant by a Government department. That is somewhat different from operating it by a Government-owned corporation. But so far as my ideas on either of those subjects are concerned, I have not had enough experience to make any suggestions to you.

Mr. HILL. Doctor, I understood you to say this plant had a capacity of about 190,000 tons of ammonium sulphate.

Dr. TOLMAN. If you should turn the fixed nitrogen into ammonium sulphate.

Mr. HILL. Has ammonium sulphate any place in explosives at all?

Dr. TOLMAN. No.

Mr. HILL. I think I also understood you to say that to make ammonium sulphate you do not first create ammonium nitrate. Is that correct?

Dr. TOLMAN. That is correct.

Mr. HILL. The ammonium sulphate is an ingredient essential to certain types of fertilizer?

Dr. TOLMAN. It is used in mixed fertilizers.

Mr. HILL. If this plant were run at its maximum capacity for fertilizer, which would be 190,000 tons of ammonium sulphate, it would not have at the same time any capacity for the production of nitrate, would it?

Dr. **TOLMAN**. If the units for making ammonium nitrate were left there, it would have.

Mr. **HILL**. Then you could not get 190,000 tons of ammonium sulphate?

Dr. **TOLMAN**. Yes, sir; if you did not operate the ammonium nitrate units.

Mr. **HILL**. If you had the two separate units, it would be a question of where you turned the power in; is that right?

Dr. **TOLMAN**. If you are going to make ammonium sulphate or ammonium nitrate, down to this part of your process here [indicating], taking in this general range, your process is the same. Then when you get ammonia gas you can run it into sulphuric acid to make ammonium sulphate, or you can take a part of the gas and run it into nitric acid and make ammonium nitrate. If you are going to make ammonium sulphate and have to keep the capacity of the plant for making ammonium nitrate you could cease to operate a part of the plant.

Mr. **HILL**. Then it would be a comparatively simple matter to make ammonium nitrate if it were necessary?

Dr. **TOLMAN**. Yes, sir.

Mr. **HILL**. In the meantime the plant could be producing ammonium sulphate?

Dr. **TOLMAN**. Yes, sir.

Mr. **MILLER**. It is very desirable, is it not, Doctor, from an agricultural point of view, that the production of ammonium nitrate be encouraged in this country?

Dr. **TOLMAN**. Ammonium nitrate or ammonium sulphate.

Mr. **MILLER**. Those things that go into the fertilizer.

Dr. **TOLMAN**. You say is it desirable?

Mr. **MILLER**. I say it is desirable that there should be encouragement given to the manufacture of those substances.

Dr. **TOLMAN**. That is a question?

Mr. **MILLER**. Yes.

Dr. **TOLMAN**. That is my belief. Prof. Whitney will testify as to the need of nitrogen; but that is my belief; yes.

(Thereupon, at 4.25 p. m., the committee adjourned to meet to-morrow, Wednesday, February 15, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS.

HOUSE OF REPRESENTATIVES.

Wednesday, February 15, 1922.

The committee met at 10.20 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The **CHAIRMAN**. Gentlemen, I expected this morning to begin with the other representative of Mr. Ford, but he has sent me word that he is ill this morning and will not be able to come down until to-morrow morning. Dr. Whitney, of the Department of Agriculture, will be here in a very short while. The governor of Tennessee is here to testify before the committee to-day, and I will ask Mr. Taylor to say a few words in presenting the governor.

STATEMENT OF HON. J. WILL TAYLOR, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF TENNESSEE.

Mr. **TAYLOR**. Mr. Chairman and gentlemen of the Military Affairs Committee, it certainly affords me a very distinct and peculiar pleasure to present to the committee this morning Hon. A. A. Taylor, governor of Tennessee. Perhaps some of the members of this committee who have been in congressional service a number of years remember Alf Taylor, as he served here as a Member of Congress for three terms from the first congressional district of Tennessee. As I said in the opening, it is a very great pleasure to me to present him to the committee this morning.

STATEMENT OF HON. A. A. TAYLOR, GOVERNOR OF THE STATE OF TENNESSEE.

The **CHAIRMAN**. Gentlemen, Gov. Taylor, of Tennessee, will give his views on this Muscle Shoals proposition to the committee. We will be very glad to hear from you, Governor, in your own way.

Mr. TAYLOR. Mr. Chairman and gentlemen of the committee, before proceeding I wish to thank the chairman and this committee on behalf of my State for the great courtesy that has been extended to us by your granting us the privilege of appearing before the committee at this hearing. I have a statement that I wish to read, and I hope you will pardon me for reading it, because I did not want to make any mistake, and I have therefore reduced the statement to writing.

I must tell the committee that I feel a sorrow to find upon arrival here that a power company in my sister State of Alabama, known as the Alabama Power Co., is perhaps delaying and disturbing this committee's approval of Mr. Ford's offer for Muscle Shoals. I am sorry that my brother governor of Alabama, Mr. Kilby, is not here, for I believe he would agree with me that the Alabama Power Co. ought to withdraw its contentions, however righteous they are, or the Alabama Power Co. ought to change its name. No corporation should bear the name of Tennessee and Alabama which oppose the immediate acceptance of the Ford offer by this committee, and while I always will and shall hope not to strain Tennessee's hospitality to any corporation desiring to build up the State of Tennessee, yet I must say that no corporation or individual is welcome in Tennessee which opposes the immediate adoption by Congress of the Ford offer. I am further informed that the street railway troubles in two cities of my State, Memphis and Knoxville, are being adjusted and refinanced by interests in New York which are identified with and may be in control of the Alabama Power Co., and while I welcome their efforts to establish the street railway transportation of Memphis and Knoxville on a sound financial basis, I must tell them that if they are opposed to the Ford offer I hope they will excuse me for saying that they are not welcome in Memphis or Knoxville—not welcome in Tennessee. No man, no interest, no corporation can oppose the Ford offer and be a friend to Tennessee and Alabama and their people and the people of the South.

We who are here from Tennessee to-day are deeply interested, and this is our reason for seeking to appear before this committee.

The Tennessee River is obstructed by the dam that has been built. We used to carry our products down the river into the Ohio River to market, but all navigation is done away with by reason of this obstruction.

It is doubtless true that the original intention of the project was to generate power to operate machinery to manufacture the munitions of war, but now that the war is over, it is easy to convert it into a plant for the manufacture of the implements of peace.

It is located in the heart of a great agricultural country; in the heart of a great mineral country and timber section; perhaps the only virgin hardwood forests left in the United States. The only reason these vast resources have not been developed fully has been the lack of machinery and cheap power to operate it.

The Muscle Shoals project is, as you all understand by this time, unfinished. The Government has expended a great deal of money, which will be lost, lost forever, if the project remains unfinished. In the nick of time there steps forward a man who proposes to lease it and operate it if the Government will finish it.

It is my privilege to be acquainted with that gentleman, and my conduct with him has given me confidence in him as a very superior man. If I needed an indorsement of him to increase my confidence in him, the indorsement of one man would be sufficient for me. Mr. Edison said in my presence that the immensity of the power to be generated by that plant when completed was impossible to conceive of, and the results, industrially, to the United States, of the completion and operation of that plant, were inconceivable also. At the same time he said that Mr. Ford is the man to take hold of it and operate it. He is the man because of his ability, because of his business sound judgment, and because he has the money.

Now, this is the indorsement of Thomas A. Edison, whom I regard as the greatest man alive to-day. If invention is the chief civilizer of mankind, Thomas A. Edison has done more to advance civilization than any living man, for he is unquestionably the greatest inventive genius of the age.

The completion, gentlemen of the committee, of this dam means a great deal to the United States and to us; in fact, it means almost everything. We are down in the dumps. We are depressed. We want this Congress to start something to give us hope. I doubt if you have—I know that this committee has not

had before it a question of so great and of such far-reaching importance as the question now before you since this committee had under consideration the proposition to provide an American army to participate in the World War.

Why, the completion and operation of the Muscle Shoals project, gentlemen, means new enterprises. It means new fields for the employment of labor. It means the creation of new wealth. It means the enlargement of the basis of taxation. It means new life, new hope.

One of my brothers remarked that it was in the South and "what do we care for the South; we are taking care of our own section."

Now, gentlemen, we are here not to try to champion the cause of any particular State or any particular section. We are Americans and we believe that whatever is good for one section is good for all. When the Government of the United States was expending \$116,000,000 in the interests of irrigation in the different sections of the West, we of the South rejoiced. We said amen! We did not object to the building of the Roosevelt Dam, which cost so many millions. We did not object to the Government of the United States donating about 120,000,000 acres of the public domain to induce the building of railroads into those undeveloped sections, to secure to them transportation. We said amen! What is good for the great West is good for the South. What is good for New England is good for the whole country.

We ought not to allow these local prejudices to have any weight, and, of course, they will not before this patriotic, intelligent committee.

We were divided once. Thank God, we are all together now. There have been two periods in this country since we were divided and hostile when we were absolutely a unit. We were united in sentiment and in purpose, North, South, East, and West, in the Spanish-American War, when the first blood spilled in that war was the blood of a son of the South. We were absolutely a unit in the recent World War when the sons of the West, and of the South, and of the North, and of the East marched shoulder to shoulder to the front, and turned the tide of battle; and I do not mean any reflection upon any other military aggregation in that great army, because any division of the American Army could have done the same thing, but it so happened that the Thirtieth Division, composed of South Carolinians, Georgians, and Tennesseans, were first to cross the Hindenberg line.

Now, gentlemen, pass this measure, start the wheels of industry to work, create this new wealth, broaden this basis of taxation, National, State, and county; do this thing, accept this Ford proposition, and I guarantee to you that every vestige of any lingering sectional prejudice that may exist will be obliterated forever.

I have detained you long enough. There are other gentlemen here with me who are better able to impart information than I am. I want to again thank you for this great privilege you have granted this delegation from Tennessee.

The CHAIRMAN. Governor, would you object to answering any questions that members of the committee desire to ask?

Mr. TAYLOR. If I can not answer them, I have gentlemen with me who can.

Mr. HULL. Governor, not to embarrass you at all, I would like to ask one question for my own information. I have not been to Muscle Shoals, but I have read some articles about Muscle Shoals and have tried to inform myself. My information is that the shoals at the present time and in the present state of the development prevented any navigation, commercially, up the Tennessee River above the shoals. I judge from your remarks that there was navigation through the shoals.

Mr. TAYLOR. Yes, sir.

Mr. HULL. To what extent was there commercial navigation? I understand that there is not over 2 feet of water and that it is a very rapid fall of some 100 feet.

Mr. TAYLOR. That is true, and if we had very large boats we have to wait a little for a tide, but we got along pretty well. I remember that my father 60 years ago sent flatboats down the river loaded with iron to the Ohio River by way of the Muscle Shoals.

Mr. HULL. Yes. We used to navigate on the Mississippi when we had low water, but we have found recently that unless you keep over 2 feet of water in the river the year around that there is no commercial navigation; is not that true on the Tennessee?

Mr. TAYLOR. We could always float flatboats loaded with grain and loaded with iron down the river over the shoals.

Mr. HULL. I understand that, but was there any real navigation? I am trying to be informed on this matter. Were there any commercial companies transporting grain down the Tennessee River and transporting other things up the river through these shoals?

Mr. TAYLOR. There was a canal, sir, 5 feet deep. It was not large enough for a very large boat, of course.

The CHAIRMAN. Is not your condition down there somewhat like the condition over in Canada, where they have boats especially to go through the rapids?

Mr. TAYLOR. Yes, sir.

The CHAIRMAN. And so you could always get through with a man who understood where the rapids were and so on?

Mr. TAYLOR. Yes, sir.

Mr. GARRETT. Governor, unfortunately, I did not get here until after you had started your statement. As I understand it, you indorse this proposition made by Mr. Ford, in its entirety, regardless of any other criticism.

Mr. TAYLOR. I certainly do; yes, sir, and I speak the sentiments of every man, woman, and child in my State.

The CHAIRMAN. Gentlemen, this morning I expected to be able to call Mr. Worthington, of the Ford forces, but Mr. Worthington this morning sent me word that he was ill and in bed and was not able to be out. Therefore, Dr. Whitney, of the Department of Agriculture, has kindly consented to tell his story regarding the Muscle Shoals matter.

Dr. Whitney, the committee will be very glad to hear you, and you may proceed in your own way, stating for the benefit of the record your name and the position you occupy.

STATEMENT OF DR. MILTON WHITNEY, CHIEF OF THE BUREAU OF SOILS, UNITED STATES DEPARTMENT OF AGRICULTURE.

Dr. WHITNEY. Mr. Chairman, as Chief of the Bureau of Soils, which has the consideration of the fertilizer material problem, we have for a long while studied the materials available for use on the soil in increasing crop production.

Some 20 years ago Sir William Crooks in addressing the British association made the announcement that if we did not work out methods of supplying ourselves with fixed nitrogen the limit of the production of wheat would soon be reached. This put the world on record, gave them notice that there was one very material step to be taken to find some way to get an independent supply of nitrogen, additional to anything that we now have, in order to keep pace in our crop production with the needs of the world.

When the European war first started, before we got into it, we recognized the importance in this country of finding a method of fixing nitrogen for the use of our farmers. We knew that a great amount of the nitrogen that was available would be diverted to war purposes. We therefore constructed in the Bureau of Soils at the Arlington farm one of the first, if not the first, unit of the Haber process of fixing nitrogen. We investigated other proposed methods but decided that this was the best. When this country went into war we had the unit in operation as a testing plant, as a small unit, and the War Department took that over, enlarged it somewhat, and after the signing of the armistice moved it from the Arlington farm to the American University, where we have continued to cooperate in the perfection of this exceedingly difficult method.

Regardless of what any interests say, it is the deliberate feeling of the scientific men of the world that the time has come when it is essential for agriculture that we have an independent source of supply of fixed nitrogen.

The fertilizer industry, as you all know, is a comparatively new industry. We discovered our first phosphate-rock deposits in 1865, and others shortly afterwards; and the potash deposits of Germany in about the same time. Nitrates and nitrogen were not used for agriculture until the early part of the last century.

The first shipload of nitrate of soda sent over to London at the instigation of Humboldt, or as a result of his travels, lay in the vessel until it was dumped overboard. No one would venture to try this new fertilizer for crops.

In 1830 a second shipment was sent over, which was sold, distributed, and used. Gentlemen, after all the years of civilization, the use of nitrate of soda—that is, the use of something that comes from outside the farm, from outside the country—was started in 1830.

The fertilizer industry was started a little bit earlier by the digesting of bones in sulphuric acid. They were mainly the bones of the farm that were

cracked up and treated with sulphuric acid. This was started, I think, by some person in Scotland about 1780. Now, you have the beginning of the fertilizer industry.

You can see that it is not a very old industry. The fertilizer industry has grown up as a scavenger industry. They have collected old bones; they have searched the plains for buffalo bones; they have gathered up all of the bones from domestic slaughterhouses. Those were the first things that were commonly used. The industry has now attained very large proportions, but it has never been put on a real chemical basis.

This material that is gathered up from the cities and as waste materials from the factories and either used as it is or processed has been the chief source of our supplies.

The time has come, however, gentlemen, when we must look to large and more independent sources. We can not depend upon the waste products. Let me tell you what we are depending upon now, and which is only sufficient to fertilize the crops of the Eastern States. Our great commercial crops of corn and wheat are not fertilized at the present time. They have got to be, if we keep pace with the needs of the world.

In ammonia we have nitrate of soda, which comes from Chile and for which we depend upon a foreign source. That is the only source of nitric acid also, and that supply, which is scraped up off of the arid plains and crystallized out, is the only source of nitric acid for the entire world. All the world is bidding for that.

Then we have sulphate of ammonia which is produced in our coke ovens, but the supply of sulphate of ammonia is limited by the amount of iron civilization needs. No one would think of coking coal for the value of the ammonia. It is a mere by-product, and the amount that we get is strictly limited by the amount of coal that is coked for use in the iron industry. Then we have cottonseed meal which is a very low carrier of ammonia. It has about 7 per cent of nitrogen, or a little over 8 per cent of ammonia. The amount of that is limited by the amount of cotton we need for our clothing. We would never think of growing cotton for the cottonseed meal.

Furthermore, while the amount of nitrogen is low as compared with other materials that we use for fertilizers, the protein content of the cottonseed meal is quite high. It is 35 to 40 per cent of protein which we need for stock-feeding purposes. So that as a feeding material cottonseed meal is one of the high-grade materials that we are using more and more for feeding purposes.

Now, we in the Department of Agriculture recognize that cottonseed meal is an admirable fertilizer, but if it can be used for feed and the material is fed directly to the animals, you do not have the uncertainties of the climate that we have when we apply cottonseed meal to the soil in the hope and expectation that we will raise a larger crop. We have the feeding value in itself, and it is better to use it as feed than as fertilizer. The same thing is true of animal tankage or dried blood which we get from our slaughterhouses. The amount of nitrogen that we draw from that source is limited by the amount of cattle we slaughter. We will never raise cattle and slaughter them for fertilizer uses.

Now, it happens that the animal tankage and the dried blood, while they have a larger nitrogen content than cottonseed meal, are also valuable as feedstuffs, and the tendency now is, and the desire of the department is, to favor the use of tankage and of dried blood for feeding purposes rather than for fertilizers.

During the war the question was debated in the department whether we should issue an order that no cottonseed meal and that none of the organic materials that we use for fertilizers now that are fit for feeding cattle—that they all should be debarred from use for fertilizers, and the question was put up to me. I said it would be a very desirable thing, "but you have got to give the farmers a source of nitrogen supply to take the place of what you propose to withdraw from them."

This gives you an idea, gentlemen, of the limitations on the nitrogen supply for the farmers now, and upon the need that we can make of those things if we apply them to other things, provided we can get a fixed supply of nitrogen from some other source.

I think you will find—I know you will find that it is the sentiment of the scientific men of the world and of all those who have looked into these matters

that the world now needs an independent supply of fixed nitrogen for fertilizers to maintain the yield of crops.

Now, at the same time that we were considering the nitrogen supply, we looked into the phosphoric-acid supply at the Bureau of Soils. We found that the methods of mining and of treating the phosphate rock were exceedingly crude and very wasteful. I think you will find in some instances that something like 68 or 70 per cent of the rock that was mined of this valuable deposit upon which the world is dependent for all time, that 68 or 70 per cent of the rock was thrown on the dumps because it was not suitable for the manufacture of acid phosphate by the sulphuric-acid method.

Furthermore, when you have a phosphate rock that carries 68 per cent of tricalcium phosphate and 32 per cent of phosphoric acid, the commercial method is to mix it in about equal weights with sulphuric acid of a certain concentration. One part of rock, one part of acid brought together, a chemical reaction sets in, and you have the ordinary 16 per cent acid phosphate made out of a 32 per cent rock. So that you have diluted it, you have added something to it. You have increased its weight twice in order to distribute the material that you want. This is uneconomical.

Now, the method we used for treating this rock, which I think I may say is the beginning of this talk about concentrated fertilizer, was to take the phosphate rock and add to it some common sand, and add to that some powdered coke. There is another advantage in this. If we take the high-grade rock which is selected for treatment with sulphuric acid, we have to add sand. If we take the run of mine rock, part of which is rejected because of its impurities, we do not have to add the sand, except possibly just to finish off the proper proportions. So that we can often take rock that has been rejected by the miners and mix it with coke and heat it in an electric furnace, using the Cottrell precipitator, which we were the first ones to try, and we can get a phosphoric acid that looks very much like the sulphuric acid, but which has different properties. This is brought down in a form more or less concentrated. This [indicating] is 76 per cent of phosphoric acid, and the rest is water. If we get the phosphoric acid out at a proper concentration and cool it, we get the crystallized phosphoric acid which is 100 per cent pure. All of the impurities have been left behind in the slag, and we have this beautiful crystallized phosphoric acid. I think the committee would like to see this. I doubt if they have ever seen it because I had never seen it until we had prepared it.

An interesting thing in this connection is the fact that this phosphate rock is treated commercially with sulphuric acid, and the rock has to be pure, otherwise it will use up so much sulphuric acid that its manufacture will be unprofitable.

In the treatment of the phosphate rock with sand, we have another acid here, ordinary sand silica, and that, when liquid—and it liquefies at a temperature of about 1,500 or 1,600 degrees, has the same acid properties that the sulphuric acid has at ordinary temperatures. So that by using this in a liquid form, it acts on the phosphate rock. It combines with the lime and sets free the phosphorus or phosphoric acid, and we get a complete recovery of the phosphorus, and a complete separation of all the impurities which we do not get with the sulphuric acid.

Now, Mr. Chairman, we have then a phosphoric acid which in its present form is not adapted to plants at all; plants would be entirely unable to live in this solution as it is now.

From the Haber process or from the cyanamid process we get ammonia gas which is perfectly colorless. You would not think there was anything there until you removed the stopper, and then you have a very, very pungent odor, similar to the ammonia of commerce. This also, in its present form, is not adapted for use, but if this ammonia gas is led into this liquid phosphoric acid, then you get a salt, an ammonium phosphate which has 12 per cent of nitrogen, and 61 per cent of phosphoric acid. Eliminating all impurities, you just have a salt, all of which will pay its freight.

The ordinary method of taking care of this ammonia gas is to lead it into sulphuric acid, and if you pass this gas into sulphuric acid, you get ammonium sulphate; you get crystals of ammonium sulphate. This is what you use on your crops. This is something with which you are all familiar [indicating].

Now, let me call your attention to the wasteful method of the manufacturer. To make this sulphuric acid he has to bring pyrites from Spain or sulphur from Louisiana, burn it, and in the burning has to use a considerable amount of nitrate of soda and other things to get sulphuric acid. He has this very

corrosive mixture, sulphuric acid, which will destroy this table or anything with which it comes in contact; but he does get ammonium sulphate, but the sulphuric acid is simply a fixer, is simply a carrier, is simply something that puts it in condition under which plants will take it up. They will not take it up in this form.

Now, instead of using sulphuric acid, which is merely a carrier, which has no value in itself, which pays no freight, and which adds an impurity, gypsum, to the phosphate rock, if that ammonia gas is led into phosphoric acid, which also can not be used by itself, then you get this concentrated ammonium phosphate which can be used and which is more valuable, pound for pound, than ammonium sulphate, because it has the nitrogen and it has the phosphoric acid, while the ammonium sulphate has only the ammonia and the sulphuric acid, which has no value at all.

Now, Mr. Chairman, in considering the fertilizer industry and in considering the possible changes in the methods of the fertilizer manufacturers, many of which are exceedingly wasteful, for example, in order to make up their particular brands of 2-8-2, or 4-8-4, they have to get materials that they can mix together; that is, with no chemical change and no loss from mixing. They also have to get low-grade materials because they can not make out of high-grade fertilizer materials low-grade mixtures without adding fillers. The fertilizer manufacturers are very sensitive about this question of adding filler, but what they do is to import kainite from Germany. Kainite has 12 per cent of potash.

The CHAIRMAN. What is that?

Dr. WHITNEY. Kainite. They import kainite which has 12 per cent of potash and 88 per cent of worthless material. They pay the freight on it and they use it in their low-grade mixtures. They could just as well import muriate of potash which carries 50 per cent of potash and 50 per cent of impurities, but if they use muriate of potash in their low-grade fertilizers, they have got to add that 88 per cent of filler that was left over on the German soil. If they bring that high-grade potash and do not bring the low-grade, then they would be compelled to use a filler; that is, sand or peat or anything that would dilute it up, so that they could conform to their formula of 2-8-2 and have so much in a ton of 2,000 pounds.

The CHAIRMAN. What does that formula mean, two parts of what?

Dr. WHITNEY. Two parts of ammonia, 8 per cent of phosphoric acid, and 2 per cent of potash.

The CHAIRMAN. Does that simplify the matter so that the scientific men who are working on this thing can understand it better?

Dr. WHITNEY. Yes, it is intelligible to them, and it is, I think, to the farmers, because they have come to speak in those same terms.

The CHAIRMAN. Would it not be better if you could speak of the products themselves without referring to the component parts.

Dr. WHITNEY. Possibly so. I may have to do both, and I will be sure to do both if I use the one.

Mr. GREENE. Doctor, very likely some of us who do not understand about fertilizers and are profiting greatly by your instruction, would like to know why this vehicle containing the fertilizer compound is necessary; in other words, why add this great bulk of useless matter to it? Why is it not distributed upon the ground in its pure form?

Dr. WHITNEY. That is the point I am coming to.

Mr. GREENE. All right.

Dr. WHITNEY. The possibilities of that have not been realized until the researches of the Bureau of Soils have shown the possibilities.

I am going to propose to you now a formula here, a complete fertilizer, that can be made from fixed nitrogen and from phosphoric acid, and from potash in one and the same plant.

It is possible to get the ammonia from the Haber process or from the cyanamid process. That is admitted. Then it is also admitted that that ammonia can be oxidized to nitric acid so that we can make both ammonia and nitric acid in the same process in the same factory. If ammonia and nitric acid are combined, you get ammonium nitrate. Now, this can be made in the same process. It can be made at Muscle Shoals.

Ammonium nitrate has a nitrogen content of 35 per cent, exceedingly concentrated; 35 per cent against 7 per cent for cottonseed meal. It also has nitrogen present, in both the ammonia form and in the nitric acid form, which is considered of importance by the farmers. Now, if we have ammonium

nitrate and if we have ammonium phosphate, which I have already shown you that you get by leading ammonia gas into phosphoric acid prepared by the furnace method, then you can get potassium phosphate into this mixture. The potassium phosphate can be made in several ways. One of the proposed ways—and I am not sure that it will be successful because we have not finished our investigations—is instead of using sand in our mixture of phosphate rock and coke, to use the potash shales that carry about 8 per cent of potash; just dump that in with the phosphate rock and the coke in proper proportions, and the theory is that we will obtain potassium phosphate in that way, in one and the same operation.

Mr. QUIN. Could you answer this question? Is there a relationship between potash and this potassium phosphate?

Dr. WHITNEY. Yes; the potash goes into combination with the phosphoric acid and gives a potassium phosphate. Here is the salt [indicating]. It is proposed to manufacture that, but the details of manufacture have not yet been worked out as well as these others.

Now, if we take a mixture, therefore, of ammonium nitrate, of ammonium phosphate, and of potassium phosphate, which can be mixed in any proportion, and I have mixed them here in this bottle, so that in this sample of fertilizer there is 12.29 per cent of nitrogen, 49.17 per cent of phosphoric acid and 12.29 per cent of potash.

You now have a mixture which has the fertilizer materials in the proportion of 2-8-2; that is, 2 per cent of nitrogen, 8 per cent of phosphoric acid, and 2 per cent of potash; but if you wanted to dilute this in accordance with the custom in the fertilizer factories, you would have to add 83.73 per cent of a filler, and you would have to pay the freight and the tonnage on 84 per cent of material that is of no value to anyone except possibly to enable them to spread it more uniformly on the ground. There are not any impurities in this material, there is no filler necessary, and every part of this mixture carries its own freight, and none of it occupies useless space in the freight car.

The CHAIRMAN. Let me understand you. Can you simply use the product and spread it over the soil without any filler or anything added to it? If so, will it then act just as well as a fertilizer?

Dr. WHITNEY. Oh, yes. This has all the necessary properties. The filler you may put in if you want to. Now, that brings up a question which the fertilizer men have asked—

The CHAIRMAN (interposing). Could you tell us why they put the filler in?

Dr. WHITNEY. They put it in because it has become a custom, because they have sold these brands which, as I have told you, have generally been made of scavenger material. They have put this up in this form and have gotten the farmers used to it. The farmer is now beginning to get away from that practice. He is himself buying nitrate of soda. He knows how, and he is capable of using the concentrated form of nitrate of soda, which has 19 per cent of ammonia. He can be trusted to apply that. He is also using acid phosphate—16 per cent acid phosphate. This formula I suggest has doubled that amount of phosphoric acid. I think if he can use it in the one strength he can use it in the other.

The CHAIRMAN. Suppose he were to use it in excess of the strength that you give?

Dr. WHITNEY. We have these different mixtures.

The CHAIRMAN. What I mean is this: You say he can use it without the filler?

Dr. WHITNEY. Yes, sir.

The CHAIRMAN. Suppose in spreading that over the soil he gets too much of the concentrated stuff in any particular portion of his farm; what would happen?

Dr. WHITNEY. He will very likely injure his crops, just as he injures his crop now if he puts on too much acid phosphate or lets the seed get too close to the acid phosphate, or if he puts on too much of the nitrate of soda.

The CHAIRMAN. Then it would be necessary for him to study this proposition very carefully so that it would work out properly on his farm?

Dr. WHITNEY. O, yes; he has had to do that.

Mr. FIELDS. The farmer can do the same thing by using it with filler, by applying too much of it, can he not? I have seen farmers burn up their crops in that way.

Dr. WHITNEY. Yes.

Mr. GARRETT. As I understood the inquiry of the chairman it was this: According to your formula, out of a ton of so-called fertilizer as now distributed by the manufacturers, you would have 320 pounds of that mixture in a ton, and 1,680 pounds of filler?

Dr. WHITNEY. Yes.

Mr. GARRETT. The process of distribution by the farmers now is by machinery that has been adapted to that work, so that he can so drill and arrange his machinery as to distribute any number of pounds he wishes over an acre of ground. Now, then, I understood from the chairman's inquiry it was whether by the use of machinery it would be possible for the farmer now to readjust himself and distribute 320 pounds of concentrated fertilizer where he had heretofore to distribute 2,000 pounds?

Dr. WHITNEY. That is a very fair question. It has to be met in one of two ways. Our fertilizer distributors are not very satisfactory as we have them now. The makers of farm machinery have got to devise better machines for applying fertilizers. You all know that those we have are none too satisfactory. If it is desired to mix a filler with this so as to get it more dilute, this can be mixed with sand or with peat, or any material you want. It can be mixed on the farm, it can be mixed at the distributing point, by the dealer, or it can be mixed by the farmer.

The **CHAIRMAN.** That explains my point of inquiry. If you will kindly proceed, we will be obliged to you. I am very sorry to have interrupted you.

Dr. WHITNEY. There have to be adjustments. This is not going to take place all at once. This is looking to the future; this is looking to the time when, instead of 8,000,000 tons of fertilizer we may have to produce 16,000,000 tons, or even more than that. It is a question of providing the material and putting it in concentrated form, and the question of how it is to be applied has to be worked out by the farm machinery men or by the manufacturers, or the farmers themselves.

Mr. FIELDS. The farmer, in applying this concentrated fertilizer to the soil, will have to follow the instructions, just as he follows the instructions now in applying the fertilizer which he gets from the dealer.

Dr. WHITNEY. Yes; he has to take care.

Mr. FIELDS. He has to be careful to follow instructions under the present system?

Dr. WHITNEY. Yes. Of course, in getting a ton of fertilizer now you pay all the freight on 2,000 pounds. You get an equivalent amount of fertilizer material and pay the freight on 320 pounds by this other method.

Mr. GARRETT. That is what I wished to develop there in connection with the process of mixing after it gets to the farmer. He would have to pay freight on 1,680 pounds of filler in each ton of fertilizer.

Dr. WHITNEY. That is what I mean now in reference to concentrated fertilizers. Of course, there are intermediate grades. For instance, when you take this rock phosphate and treat it with phosphoric acid you can get a double or a triple superphosphate that carries 45 to 50 per cent of phosphoric acid. That is a great advance over what we have been doing over the method we have been pursuing. But, strange to say, that concentrated phosphate is in very little demand. If we leave more of the filler in Florida or in Tennessee and deliver to Baltimore a concentrated acid phosphate that contains 45 or 50 per cent of phosphoric acid, the manufacturer in using it in his mixtures is obliged to restore to it, in order to get his formula, the impurities that equal those that have been left in Florida or Tennessee.

I have spoken of the formula 2-8-2. I have here also mixtures of other kinds. Here is one of 10 per cent nitrogen, 8 per cent of phosphoric acid, and 4 per cent of potash. That is equally satisfactory as a mixture.

The **CHAIRMAN.** Is that referred to as 10-8-4?

Dr. WHITNEY. That would be 10-8-4, and it is a highly nitrogenous fertilizer. Here is one which is called 4-8-10, which contains 4 per cent of ammonia, 8 per cent of phosphoric acid, and 10 per cent of potash, which would be something like what they use in the potato fields of Maine. And they can be mixed in all proportions.

Mr. FIELDS. The character of the mixture, or the proportion of the mixture, is determined by the character of the soil to which it is to be applied?

Dr. WHITNEY. Yes.

Mr. FIELDS. And the crop to be grown?

Dr. WHITNEY. Yes. Mr. Chairman, there is a situation in the fertilizer industry now that is difficult to explain and difficult to understand.

When the war came on we knew that potash would be denied us by an embargo on the German potash salts. Congress authorized investigations to find possible sources of potash in this country. We found that we have an

ample supply of potash in this country for our needs. It is a question of manufacturing costs.

The Bureau of Soils feels that we will eventually be able to supply our needs, but that is a prediction that I want you to take with caution, because it is tied up with manufacturing enterprises, and the potash is generally a by-product. So that while we know we can get the potash under stress, the question of how much we can produce in competition with the foreign supply is one that we can not answer.

At the present time, or in 1920, the fertilizer manufacturers estimated a tonnage for 1921 of around 8,000,000 tons. As you will remember, the break in the business markets of the world, in the farmers' prices which they were able to get for their products, and the manufacturers' prices for their products began to appear in Washington about February, 1920. The indications were not sure, but we rather looked for a break to come.

In March, the manufacturers contracted for their ammonium sulphate at prices then prevailing. They contracted for their ammonium sulphate in March of 1920 for the season of 1921. Now, by May and June, the break was very pronounced. The farmers had experienced their losses of revenue, and by the time the fertilizer men decided, or were deciding on their prices, from November to December, 1920, the market in fertilizer materials had broken and had gone to pieces, and by the time the farmers began to buy in the spring of 1921, the market was completely demoralized. The actual sales of fertilizer materials which it was anticipated would be about 8,000,000 tons in 1921, was approximately 4,500,000 tons, due to lack of buying power. That left the manufacturers with a large amount of material, of high-priced material, to carry over in 1922. Now, the difficulty of bringing down prices where material has been carried over for two years is very great. But it happens if their anticipations are correct, that the market for 1922 will not be much larger than the market for 1921, then they have a large part of their material that they will need in 1923, which was actually bought under contract prices of the spring of 1920.

Now, there is no price for fertilizers. There is no price for fertilizer materials. It is a buyer's market; you can get the material for what you are willing to give. At the present time there is a large excess of nitrate of soda in this country; there is a large excess of ammonium sulphate, although the dealers will tell you there is a great activity. But there is an excess of ammonium sulphate, although it is less than it would have been if there had not been a shut down of the iron and coke ovens. There is a large excess of potash salts in this country, imported. They imported last year about the same amount as they imported in 1913, but the purchasing power was gone and the price now is down below the 1913 price. To make any statement, to make any prediction of the amount of material that will be needed right now is very difficult. We have these surplus conditions in all lines of business; it is admittedly abnormal. What we must look at here is not what the conditions are to-day, but what they will be when we return to a normal situation. They anticipated 8,000,000 tons of fertilizers to be called for last year. If it had not been for the intervention of the war and the fact that during the war period we saw no increase in fertilizer production, instead of having 8,000,000 tons we should have expected a market of about 10,000,000 tons, because there is a pretty steady increase of about $7\frac{1}{2}$ per cent per annum in the consumption of fertilizers. That is as close an estimate as can be made, so that we should be looking for 10,000,000 tons of fertilizers before very long, and we would have had them if it had not been for the war. When the demand is increasing at that rate it is becoming more and more difficult to get adequate supplies of ammonia, and that is the limiting condition. We have plenty of phosphoric acid, and we are searching very diligently for potash. We can get it anyway from European sources. But the nitrogen is the limiting condition.

If we have the fixed nitrogen products we have got to change our fertilizer system in order to use those fixed nitrogen products to the best advantage, and now is the time, in the United States, to change the whole system and adopt a new standard.

The CHAEMAN. Doctor, the members of the committee will probably like to ask some questions in reference to the statement you have made. Is it your opinion that the Muscle Shoals nitrate plant No. 2 would, therefore, be of essential value in the fertilizer business in the United States, if it is carried on constantly?

Dr. WHITNEY. Mr. Chairman, I would rather not answer that question for the reason that I have had nothing to do with the Muscle Shoals project, except in an advisory capacity in regard to what might be made there. I know nothing of the plans of operating it. I can only say that the fixed nitrogen products that we obtain from either the Haber process or the cyanamid process we consider essential to the future welfare of this country. Those things are made there, but whether the Muscle Shoals plant should be continued under Government ownership or private ownership I would not like to pass an opinion on.

The CHAIRMAN. The testimony before the committee is to this effect, as I recall it. Mr. Ford is willing to buy nitrate plant No. 2 and also nitrate plant No. 1, the Waco quarry, the transmission line, which is about 88 miles long, and one or two other things; but his representative stated yesterday before the committee that he proposed to use nitrate plant No. 1, not for the manufacture of fertilizers but for the manufacture of automobiles. Nitrate plant No. 2, which uses the cyanamid process, Mr. Ford is willing to use for the manufacture of that material which is necessary in fertilizers. So that Mr. Ford's offer is not really for continuing both plants for the manufacture of nitrates. He wants to use only the one plant for that purpose. That is the testimony before the committee at the present time, as I recall.

Dr. WHITNEY. Mr. Chairman, knowing nothing about the plans of Mr. Ford, and knowing nothing about the Muscle Shoals outfit, I can only say that from the agricultural point of view there is all the appearance of fitness for the manufacture of concentrated fertilizers, and any plans that will make possible the manufacture of nitrogen fixed products and the concentrated fertilizer you can get by that would be a great thing for the American people. If we do not get it at Muscle Shoals, we will have to get it somewhere else. As the building is erected and as the factory is completed, it would seem to me if arrangements can be made they should be made to encourage the production at that point.

Mr. GREENE. Doctor, I suppose the basis of all farm fertilization now, in the light of modern science, must be soil analysis?

Dr. WHITNEY. No; it is the results obtained from the trying of fertilizer on the soil. Soil analysis has failed us completely as a method of determining what fertilizer is required.

Mr. GREENE. So then it is determined simply by localized and specialized experimentation?

Dr. WHITNEY. Yes, sir.

Mr. GREENE. One man's farm, after some experience, demonstrates the result that it needs certain kinds of fertilizer.

Dr. WHITNEY. It is one man's farm extended over a similar type of soil. We would go as far as that, and in the soil surveys we are making we anticipate that there will be certain fertilizer treatments for certain types of soils. But provided always that the farm has been handled in a thorough-going, up-to-date manner. Gentlemen, regardless of your farm, regardless of your soil, you must remember that the market needs a product of the joint effort of a man and of a soil. The man is the intelligent and directing head of that partnership, and he is responsible for the maintenance of conditions in the soil, just the same as you say he is responsible for maintaining your animal in a good condition.

Mr. GREENE. What I wanted to get at was whether you have some more or less fundamental basis upon which every man fertilizes his farm; that is to say that there are certain recognized principles which vary with localities and character of soil, and start right in on the use of fertilizers, with his knowledge of the local conditions.

Dr. WHITNEY. It is based upon empirical information at the present time, and it has been based upon empirical information, no matter what the claims of the scientists may be. It has been based upon trials made here and there.

Mr. GREENE. We will assume that after such experimentation the farmer arrives at what may be regarded as a safe standard for the fertilization of his soil. Does he experience any change in that standard through the accumulated use of fertilizers that have this large content which is merely a vehicle for the introduction of new soil and new elements?

Dr. WHITNEY. Mr. Chairman, the experiences of the scientists of the world in respect to the fertilizer trials on land has been very peculiar, and it is very interesting. It forms a very interesting chapter in the narrowness of view with which we start out. Seventy years ago Sir John Laws, who was then interested in making superphosphates of lime by sulphuric acid treatment of

bones, in association with Liebig, and in controversy with Liebig as to the value of things, started a series of experiments with a large number of fertilizer materials. Those have been running continuously for over 70 years. Now that we are looking at this intently, the fertilizer men or soil men are studying things as they never have studied them before. This is what we find, that the Rothamsted station has shown: The wheat in the unfertilized plot has decreased rather steadily from about 18 bushels per acre to about 9 bushels per acre. On the plots where complete fertilizers have been used for each one of these 70 years the yield shows an increase over the check plot, a continuing increase for about 10 years, and then there is a sudden break, and the yield follows the check plot; that is, the increase is maintained, but as the check plot is decreasing so are the fertilized plots decreasing after the first 10 years in proportion to the decreasing yield of the unfertilized plot.

This matter has recently come out. It has not been recognized. Very recently a gentleman was here from the Rothamsted station to confer with us about these and other matters, and I said, "You, in your wisdom, thought you could establish a method or could find out a method 70 years ago, a treatment which, if projected, would continue to serve you throughout all time. You find now that over a paltry 10 years you obtained an increase, but that since that time your soils have been going down." Now, as I said, the English gardener has met that situation by a change of method of handling his soil. The English gardener started, or the English farmer, 300 years ago, with an average yield of 12 bushels of wheat per acre. If he had adopted the Rothamsted scheme at that time he would have gone up to a certain amount and then he would have gone down. Now, instead of that, he has continued to go up; he has not been satisfied with the methods that he was using 300 years ago, but he has changed his methods so the yield on the English farm as increased from 12 bushels, 300 years ago, to 32 bushels at the present time, and they have done better than they have done at the Rothamsted experiment station, by meeting the conditions.

Now, I said to this gentleman, "What are your experiences during the 70 years? Look back and tell me what it is you have noted?" He said there have been great changes in the appearance of the soil; there have been changes in the character of the weeds, of native vegetation. Some of them have become so foul with weeds that we can not handle them. We have to get laborers to pick the weeds out by hand, and some of the soils have run together where nitrate of soda has been used, and where the soils have run together during these 70 years they are less easily worked. I said, "Now, an English gardener would have seen those changes as they came up; he would not have waited 70 years; he would have met the situation, he would have seen those indications of change and would have remedied it." That is the difference.

MR. GREENE. What I wanted principally to get at was whether you people are now satisfied yourselves, by such experience as has been had, that with the constant fertilization and refertilization of a given plot of ground under the old method in which the real fertilizer compound is a comparatively small percentage and the rest is a great vehicle to convey it, the addition of that useless matter from other soils from other places, such as sand, eventually accumulates in such proportion on the soil that it changes the character of the soil and therefore ought to lead to new kinds of fertilization of it.

DR. WHITNEY. I would not say that; we have no reason to say that.

MR. GREENE. Then are we as laymen to be satisfied that so far as the present knowledge runs in the chemistry of the earth, the great laboratory that the farmer employs has arrived at an approximate safe standard so far as we can see, as to the use of certain elemental chemical compounds?

DR. WHITNEY. Yes.

MR. GREENE. And is not likely to vary from them?

DR. WHITNEY. There will be some variation, but we think, after our experience in all these years, that this is a safe thing. We may improve them; I have no doubt in the world that we will improve them. This is just the first step in our knowledge of the soils. We know that these fertilizers increase the yield, but we do not know how they increase it. That is a very important study, the question of how the fertilizers get on the soils. That is a very important subject that we have got to understand.

MR. GREENE. That leads to the only question that I could propose to you, with my limited information, that might give me light on the present problem. Have we reason to expect that for the century ahead of us we shall depend upon nitrates?

Dr. WHITNEY. Yes; we have.

Mr. GREENE. That at least is an elementary proposition?

Dr. WHITNEY. Yes. We will depend on nitrates or phosphoric acid, and on potash.

Mr. GREENE. And the changes are likely to be such derivatives of certain chemicals of that character, or a form of adaptation and mixture, or their application?

Dr. WHITNEY. Yes; those are the changes.

Mr. GREENE. The basic will possibly be the same?

Dr. WHITNEY. That is what we believe.

Mr. GREENE. So that this present contract, which appears very attractive for the manufacture of nitrates, is not likely to become depreciated in the course of time by some subsequent discovery of science as will beyond question put that product out of further use?

Mr. WHITNEY. No; we do not see any signs of it.

Mr. GREENE. I believe you said you were not familiar with the mechanical side of the proposition down there and as to whether Mr. Ford would probably be able to follow up those changes, you do not feel qualified to speak?

Dr. WHITNEY. No; I know nothing about his plans.

Mr. PARKER. Dr. Whitney, you spoke of the good experience of the English farmer. I have always understood that the English farmer got nitrogen by rotation of crops and stall feeding of cattle. Does he?

Dr. WHITNEY. Yes; he gets part of it in that way.

Mr. PARKER. He uses that much more than our farmers do, does he not?

Dr. WHITNEY. He uses it more intelligently.

Mr. PARKER. Our farmers neglect rotation of crops very much, do they not?

Dr. WHITNEY. Yes. Our farmers have been on their farms but a short time, too short a time to really become acquainted with their soil type. The English farmer has been on his farm through generations. They have come down on the same type of soil. Still more striking is the situation in the case of the Japanese farmer. The Japanese farmer values his oldest soils, and I asked one of them what he meant by old. I asked that question of a professor of the University of Tokyo, and he said, "Our history goes back to 8,000 years ago." They value the older soils more than they do the new ones, because they have a knowledge; they have that under control, and it is safer. The last census—that is, the census of 1910—showed that 54 per cent of our farmers had not been on their farms five years. See what a contrast that is. Less than five years on their farms! They can not have acquired that knowledge, that skill, that intuition, that control over their soil that is necessary in that time. Does that answer your question?

Mr. PARKER. It does; but yet it does not get to the point I would like to bring out. What are the methods they use; that is, the Japanese and the English? They are perfectly open, are they not?

Dr. WHITNEY. Oh, yes.

Mr. PARKER. Those methods have been successful, continuously, while the application of chemicals failed after 10 years?

Dr. WHITNEY. Yes.

Mr. PARKER. What are those methods?

Dr. WHITNEY. Those methods are the result of experience.

Mr. PARKER. What are they?

Dr. WHITNEY. It is intuition.

Mr. PARKER. What particular means do they use?

Dr. WHITNEY. No one can tell. It is like the care of an animal. A gentleman came to me not long ago with a sad tale about a Holstein cow from which he had been deriving seven gallons of milk a day, which was more than his family needed. It had gone down to less than a gallon a day. I asked him if his cow was sick or showed any signs of distress. He said no; that the cow was feeding all right. I said, "Have you changed your man?" "Yes," he said; "I remember about six months ago I changed." "Now," I said, "you had better get rid of the man you have and get back the man who understands the nature of that cow." It is a matter of experience. You can not lay down a line of development.

Mr. PARKER. I can ask you as to some of the methods I have heard of. What is the effect of the use of turnips and rutabagas on the soil?

Dr. WHITNEY. It changes the style of cultivation.

Mr. PARKER. Does it add either nitrogen or phosphorus or potash?

Dr. WHITNEY. No.

Mr. PARKER. As to the use of beans and peas; they add nitrogen, do they not?

Dr. WHITNEY. Yes; they are the leguminous crops.

Mr. PARKER. And add nitrogen in quite large quantities?

Dr. WHITNEY. Yes; in considerable quantities.

Mr. PARKER. Do they cost as much to use as the chemicals we buy?

Dr. WHITNEY. That is rather difficult to answer. If they can be raised, and if they are of value in themselves, it is all right. But when they are used as a seasonal crop and have in themselves no particular value, no market value, they do. For instance, if you grow cowpeas and give up the use of the land for an entire season to grow cowpeas, it would be cheaper to buy chemicals.

Mr. PARKER. Does not the English farmer always insist upon the rotation of crops?

Dr. WHITNEY. Oh, yes; but they have different ones for different types of soil.

Mr. PARKER. They have rotation of crops lasting through four or five years, have they not?

Dr. WHITNEY. Oftentimes they do.

Mr. PARKER. What about the Japanese?

Dr. WHITNEY. They also rotate their crops. They have a much more intense system of rotation. They often raise four crops on the same soil in a year.

Mr. PARKER. All different crops?

Dr. WHITNEY. Yes; different crops.

Mr. PARKER. Those methods do add nitrogen, do they not; that is, the use of cowpeas, etc.

Dr. WHITNEY. Yes.

Mr. PARKER. As to the stall feeding of cattle, that adds the nitrogen—that is, the use of manure?

Dr. WHITNEY. Just a moment. It is a question as to just what you mean. The stall feeding of cattle does not necessarily mean the adding of nitrogen from a source outside of the farm.

Mr. PARKER. I see that perfectly; but they add the nitrogen that goes into the crops that they eat?

Dr. WHITNEY. Yes.

Mr. PARKER. And some of that comes out of the air, does it not?

Dr. WHITNEY. If you have the leguminous crops, but if you take the ordinary pasture grasses and the grains grown on a farm and feed the animals with that you would get very little nitrogen.

Mr. PARKER. You save it?

Dr. WHITNEY. You save it, and you return it in a condition in which it is quite active.

Mr. PARKER. How about the phosphorus? Is there any phosphorus saved by stall feeding?

Dr. WHITNEY. Yes; you save all of the phosphorus taken up by the crop from the soil.

Mr. PARKER. How about potash?

Dr. WHITNEY. The same thing would apply; but you add nothing that comes from outside the farm unless you deliberately buy something and bring it in.

Mr. PARKER. I am speaking of the things not bought and brought in. They do add the nitrogen that comes from the leguminous crops?

Dr. WHITNEY. Yes.

Mr. PARKER. Do these English farmers who have had such a successful experience use much outside fertilizer, or do all of them go without it?

Dr. WHITNEY. They use fertilizers very freely.

Mr. PARKER. What about the Japanese?

Dr. WHITNEY. They are using fertilizers now.

Mr. PARKER. I mean in their olden days.

Dr. WHITNEY. No; there were no fertilizers at that time; that is, there were no fertilizers in the sense in which we understand them.

Mr. PARKER. I mean chemical fertilizers.

Dr. WHITNEY. No; there were not any.

Mr. PARKER. During the period of growth of the English production from 12 bushels to 32 bushels an acre did the English farmer use much fertilizer?

Dr. WHITNEY. He did not have it.

Mr. PARKER. And yet he made his crop grow from a yield of 12 bushels to a yield of 32 bushels an acre?

Dr. WHITNEY. Yes; the fertilizers that have come up in modern times have given us another and an additional method to use in increasing crops.

Mr. PARKER. I am speaking of the men who make the real progress, the English and Japanese farmers. The English farmer, when he was bringing up his production, did not use outside fertilizers, and the Japanese, when he was maintaining his production, did not use outside fertilizers?

Dr. WHITNEY. No.

Mr. PARKER. Are you familiar with the Haber process and the cyanamid process, so far as the cost of material is concerned?

Dr. WHITNEY. No; not on a commercial scale.

Mr. PARKER. You do not speak, therefore, on the question as to whether nitrates can be made here so as to compete with the Chilean nitrates?

Dr. WHITNEY. No.

Mr. PARKER. Nor whether, by mechanical processes we can make potash to compete with the German potash?

Dr. WHITNEY. In a general way only.

Mr. PARKER. You can not speak as to the costs?

Dr. WHITNEY. No.

Mr. PARKER. The electrical furnace has to be used in some of these processes?

Dr. WHITNEY. Yes.

Mr. PARKER. Is it a cheap or expensive way of getting heat?

Dr. WHITNEY. It would depend largely on the cost of the power. We have operated an electrical furnace, and we are now operating a fuel furnace, and we have been studying the cost of production, but the cost of production in our laboratory experiments, of course, can not be applied to the commercial plant.

Mr. PARKER. In your laboratory experiments, how did the cost of the fuel compare with the cost of the electricity?

Dr. WHITNEY. The fuel is generally cheaper than electricity.

Mr. PARKER. How much?

Dr. WHITNEY. It is generally considered about half as much. But that all depends entirely upon what you pay for your power.

Mr. PARKER. But I am talking generally.

Dr. WHITNEY. In Hoboken, where we carried on some of our experiments, we were paying \$25 per horsepower, and with that cost of power we considered that we could cut the cost of producing phosphoric acid something like half, and cut the cost of power something like half, if we used the fuel furnace.

Mr. PARKER. In producing phosphoric acid the fuel costs half as much as the other power?

Dr. WHITNEY. At those rates; yes.

Mr. PARKER. Do you know enough about the cost of making these materials you have mentioned to know whether they can be made so as to compete with the phosphate rock and the German potash?

Dr. WHITNEY. We believe they can.

Mr. PARKER. Have you any warrant, on a commercial scale, for saying that you can?

Dr. WHITNEY. I think we have.

Mr. PARKER. You have not mentioned that.

Dr. WHITNEY. I would rather not speak of that because I am not an authority.

Mr. PARKER. Who would be able to speak on that?

Dr. WHITNEY. Dr. Tolman has been in direct contact with that.

Mr. PARKER. He said yesterday, as I recall, that as far as he can understand, sulphate of ammonia could not be made at present at Muscle Shoals and compete with the sulphate of ammonia sold in the market.

Dr. WHITNEY. I do not believe we want sulphate of ammonia.

Mr. PARKER. He spoke of that as the simplest thing that could be made. These mixtures you have spoken of here have not been used in commerce, have they? They have not been used except in laboratory experiments?

Dr. WHITNEY. They have been used in field experiments, but they have never been available for use in commercial work.

Mr. PARKER. These are propositions you think might come in?

Dr. WHITNEY. Yes.

Mr. PARKER. That is all you can say about them?

Dr. WHITNEY. Yes.

Mr. CROWTHER. Doctor, there is some little difference, it seems to me, between the statement you made to-day and the statement made by Dr. Tolman yesterday, and by some of the other witnesses, in regard to the fact as to whether this plant at Muscle Shoals is presumed to make and was originally

constructed to make ammonium nitrate. The question has been asked several times, how much ammonium sulphate, which they say is a component part of fertilizer, can be produced there. You say you do not think we want any ammonium sulphate, that the advantage is in the more highly concentrated nitrogen product.

Dr. WHITNEY. Yes.

Mr. CROWTHER. Then we do not need them?

Dr. WHITNEY. I should not think so.

Mr. CROWTHER. It has been said that this plant has a capacity of 110,000 tons of ammonium nitrate, which was to be treated by sulphuric acid and developed into ammonium sulphate for fertilizer purposes.

Dr. WHITNEY. That is one way; that is the easiest way; it is the best known way.

Mr. CROWTHER. As I understand you, you said it was rather a wasteful procedure?

Dr. WHITNEY. That is my opinion.

Mr. CROWTHER. What is the use of starting in on what is acknowledged by authorities to be a very wasteful proposition?

Dr. WHITNEY. I think in working out their plans it will be a long while before they can get that into operation.

Mr. CROWTHER. I realize that.

Dr. WHITNEY. I have been working on these matters quite a little while. I made a statement before the Graham committee on war expenditures of the House (hearing before subcommittee No. 5 (Ordinance), 66th Cong., 2d sess., serial 6, pt. 50, p. 2878), and also made a statement before the Senate Committee on Agriculture and Forestry in hearings on the production of atmospheric nitrogen. This matter has been available, and all of us are thinking along these lines. I could not tell you what should be done without considering the whole thing. The methods available down there and the materials available down there and the fertilizer need, marketing possibilities and things of that kind are matters to be taken into consideration. I have only sketched before committees of Congress just the idea that the concentrated fertilizer has got to be adopted to dispose in the most ready way and the most efficient way of fixed nitrogen products. The ammonium nitrate is not a good fertilizer itself; it is not a satisfactory fertilizer. It will not mix in large proportion with our acid phosphate as we have it to-day. Cyanamid, as Dr. Tolman told you yesterday, is not a satisfactory fertilizer; because it will not mix with our fertilizer materials.

Mr. CROWTHER. Are these materials soluble; could they be used with a sprinkler?

Dr. WHITNEY. These concentrated fertilizers are.

Mr. CROWTHER. Then they could be used with sprayers, just as we use sprayers in orchards?

Dr. WHITNEY. Yes.

The CHAIRMAN. Will you kindly cite the title of the volume you referred to a moment ago, so it will be in the record?

Dr. WHITNEY. This is a copy of a hearing on the production of atmospheric nitrogen. The hearing was held before the Senate Committee on Agriculture and Forestry in the second session of the Sixty-sixth Congress, and this is in part 2 of that hearing, beginning April 8, 1920.

Mr. FIELDS. Doctor, what is the extent of our deposits of phosphate rock in the United States?

Dr. WHITNEY. Very great. The first deposit was developed in South Carolina. That was a small deposit, a river deposit. That has been practically used up; at least, they are not working it now very much. The Florida phosphate was next discovered. Those deposits are very large. The Tennessee deposits are also large, although not quite as available to the fertilizer-using country. Then there are the western phosphates, which are enormous. Nobody knows the extent of those. They are tremendous.

Mr. FIELDS. Have we large quantities of the potash shale you referred to in the United States?

Dr. WHITNEY. Yes; we have a great deal of the insoluble potash rock; not so much of the potash shale, perhaps, but we have a great amount of potash material that could be used. The difficulty has been the cost of handling it. It is low-grade material and is not worth working over by itself.

Mr. FIELDS. In what section of the country is that found?

Dr. WHITNEY. You mean the potash shale?

Mr. FIELDS. Yes.

Dr. WHITNEY. It has never been mapped, particularly. There are known deposits in Alabama and Georgia, and there are deposits of shale near the Muscle Shoals that carry, as I understand it, about 8 per cent of potash. They have been called to our attention by the War Department. Then there are deposits in Illinois and throughout the country. Then there are the green sands of New Jersey, which carry about 7 per cent of potash. They were used as fertilizer in New Jersey before potash became so common and so cheap. These green sand marls were used, but they are so relatively insoluble that they can not carry the cost of transportation.

Mr. FIELDS. I know there are great quantities of shale in my own State of Kentucky, and I am wondering if this product is contained in all shales, or only in certain kinds.

Dr. WHITNEY. No; the composition of shale varies considerably. It is the high-grade potash shale that we want to get.

Mr. FIELDS. I have read that it is possible to produce gasoline from shale. If the process is perfected, this would probably be a by-product of the potash, would it not?

Dr. WHITNEY. That would depend. The oil-bearing shales are in different localities. They are also a class by themselves.

Mr. FIELDS. At any rate, we have advanced far enough with this subject to know that we have all the fertilizer compounds within the United States, if we will but develop them.

Dr. WHITNEY. Yes, sir.

Mr. FIELDS. And in the fertilization of the soil we are not dependent upon the products of foreign countries?

Dr. WHITNEY. No; we have the products here; but there is an exchange value. It is at present cheaper for us to get nitric acid from Chile and muriate of potash from Germany, because we have not developed our own processes here.

Mr. FIELDS. The process of development is what I am talking about. It is possible for us to develop it within the United States?

Dr. WHITNEY. Yes.

Mr. FIELDS. What is the annual increase in the demand for fertilizer, Doctor?

Dr. WHITNEY. It is rather difficult to say. The best figures we have show that it is about 7½ per cent per annum.

Mr. FIELDS. Have you made an estimate of the annual percentage of the depreciation of the soil that is under cultivation—that is, without the use of fertilizer, I mean?

Dr. WHITNEY. No; we have not. We have made a few experiments that show that on certain soils of the United States the yields of our principal crops are increasing.

Mr. FIELDS. Yes; and I understand from my study of the subject that it is possible to increase the production of the soil by rotation of proper kinds of crops, proper plowing of the soil, etc.

Dr. WHITNEY. Yes; and better methods. That has counted for more in the present improved state of agriculture in England than anything else. It is better methods, including tillage, drainage, rotation, selection of seed, keeping up live stock, and things of that kind, that have increased production.

Mr. FIELDS. It is possible that our failure to realize earlier the necessity of the fertilization of the soil has been due to the fact the soil was new and the farmers had a virgin soil to cultivate and did not realize that it was then or would become necessary in the future to employ fertilizer so as to keep up their production.

Dr. WHITNEY. The farmer has felt the pinch of necessity. The great thing that stirred up the English agricultural interests was the pinch of necessity. When they were growing 12 bushels of wheat it was during the Baronial period, when the country was not so thickly settled as this country is or was 10 years ago. They had about 3,000,000 people in England. But at the close of the Baronial period, when they began to acquire ownership of the land, then they were unable to move as they had been doing before, because, from all accounts, during the Baronial period the peasants moved, constantly shifting their homes, and their lands would get foul with weeds, and their yields would go down, and they would move their garden or their fields to some other locality.

But with the desire for settlement and the acquiring of title to their lands, they began to feel the pinch of necessity, and they had to produce more per acre because they did not have the increased acreage to take up.

Mr. FIELDS. Is it not a fact that practically every State of the Union now is feeling, as you say, the pinch of necessity for fertilizer to the same extent?

Dr. WHITNEY. Yes; we are feeling that, but it is not so very stringent yet.

Mr. FIELDS. But with an increase of $7\frac{1}{2}$ per cent per annum it will be felt more and more each year?

Dr. WHITNEY. Yes. In the Congressional Record of January 7, 1921, Senator Smith of South Carolina published a letter that I had sent out to the commissioners of agriculture and the directors of the experiment stations in regard to what they thought of the necessity for fixed nitrogen compounds, especially those that could be obtained through the Muscle Shoals method. It might interest you, Mr. Chairman, to have that information in your record.

Mr. FIELDS. I will ask, Mr. Chairman, that that be put in the record at this point, so that we may have the benefit of it in considering this question.

The CHAIRMAN. Without objection, the letter will be inserted in the record.

Dr. WHITNEY. In this connection I estimated at the time that we were using 227,888 tons of ammonia. I estimated that if the country as a whole used fertilizers in proportion to the use in Georgia we would require 751,945 additional tons of ammonia. The use in Georgia, the intensity of the use of commercial fertilizers I show in this letter to be 160 pounds of fertilizer per acre of land in crops.

Now, the intensity of the use of fertilizer in Germany at that time was 180 pounds of fertilizer per acre of land in crops; in England it was about 160 per acre of land in crops. So that the intensity of use in Georgia was about the same as English practice.

I show furthermore that there were seven States that were using fertilizer more intensively than Georgia, including Maine, and quite a number of other States mentioned in the letter. Based on those figures, which I thought were fair because according to our own methods of use it was not thought excessive compared with the French, German, and English pounds used. If we should extend the use of fertilizer over the remaining acres of land in crops it would require 751,000 tons increase over the 227,000 tons we are now using. I think that is a conservative figure, and yet it is looking long into the distance.

(The letter above referred to is as follows:)

UNITED STATES DEPARTMENT OF AGRICULTURE,

BUREAU OF SOILS.

Washington, August 14, 1920.

DEAR SIR: The Bureau of Soils would like to have your opinion on certain important problems connected with the fertilizer industry of the country, and I am inclosing a list of questions which I should be very glad to have you, after careful consideration, answer and return.

The application to the soil of the modern fertilizer materials, which started about 60 years ago, has been one of the important means of increasing the acre yields of crops. It has grown to large proportions, especially in Europe and in the United States.

In this country the supplies of potash have been obtained mainly from Germany, phosphate rock mainly from Florida and Tennessee, and ammonia, the most costly ingredient, has been derived in part from nitrate of soda imported from Chile, from sulphate of ammonia obtained from the by-product of coke ovens and from city gas works, and by the use of castor pomace, cottonseed meal, animal tankage, dried blood, and fish scrap. Garbage tankage is also a small but rather important source; and factory wastes, such as leather scrap, horn shavings, etc., have been processed so that their nitrogen has been made available. The organic ammoniates have been valued not only for their nitrogen supply but also as containers for the minerals that have been used.

Some 20 years ago the world was startled by a statement made by Sir William Crooks before the Royal Society of England that the future of agriculture and food supply of the world was threatened by the relatively decreasing supply of ammoniates. Since then the scientists of the world have been actively studying methods for the fixation of atmospheric nitrogen for an independent source of nitrogen supply for fertilizers.

It has been foreseen by many that if we are to increase the food supply with the increasing demand for food the fertilizer industry must eventually be put on a chemical basis; that is, while use will always be made of wastes and by-products for fertilizer, the industry must be able to look for a dependable supply to chemical plants manufacturing fertilizer materials as their primary product. The European war has sharply emphasized the importance of this

subject and has tended to bring about changes in the fertilizer industry much quicker than they would otherwise have developed. The increasing demand for meat and animal products has resulted in the increasing use of the organic ammoniates for direct feeding purposes, with the result that the organic ammoniates to-day are hard to obtain for fertilizers, as they bring higher prices for feeding stuffs and their direct use for feeding purposes is saner than their indirect use as fertilizers. The war has also stimulated the production of fixed-nitrogen products, so that the world is equipped to-day to fix the nitrogen of the air and make it available for fertilizer material.

Under the stress of war conditions the War Department has erected a great nitrogen fixation plant at Muscle Shoals, Ala. The primary product made at the Muscle Shoals plant is calcium cyanamide. This is a basic nitrogenous product, which is capable of being transformed into the commercial fertilizer material bearing the trade name of "cyanamid." The latter is a product in whose use difficulties have been encountered, and whose action under certain conditions is deleterious. Cyanamide is not an ideal substance to use in mixed fertilizers, as it can only be mixed in small proportions with the ordinary form of acid phosphate. The Muscle Shoals plant is equipped to convert the nitrogen of the crude calcium cyanamide into ammonia and to oxidize part of the ammonia into nitric acid, from which ammonium nitrate may be obtained, a very important material for explosives. Ammonium nitrate gives good results when used as a fertilizer. It is rather deliquescent and therefore somewhat objectionable for this reason as an article of commerce. It is likewise not adapted for use except in small proportions in mixed fertilizers, as it reacts with the acid phosphate and readily decomposes. One can convert the nitrogen of crude calcium cyanamide into ammonia and absorb it in sulphuric acid, making ammonium sulphate, and this is the plan, in case Congress authorizes the operation of the plant in peace times for the manufacture of fertilizer material. How it shall dispose of this product and the price to be charged with reference to the commercial prices is a matter which need not be discussed here.

The Bureau of Soils has been working for a number of years on the problem of fixing atmospheric nitrogen and also on the conservation of our phosphate deposits. Ordinarily the phosphate rock is treated with about an equal weight of sulphuric acid to convert the insoluble calcium phosphate into a soluble form of calcium phosphate and a considerable amount of gypsum. This product (acid phosphate) is being sold to the farmers usually in a form which contains 16 per cent of available phosphoric acid (P_2O_5). The sulphuric-acid treatment requires a rock of rather high purity and low in iron, alumina, and carbonate of lime. In getting out rock of sufficient purity for the acid-phosphate manufacturers about two-thirds of the rock that is mined is thrown on the dump as waste material.

The Bureau of Soils has been working for several years to conserve and use this wasted phosphate material. If cheap water power were available, the wasted phosphate rock could be smelted in an electric furnace and collected as a liquid and the phosphate extracted, resulting in the saving of most of the rock now mined and at present thrown away. In the absence of cheap water power the bureau is experimenting with a furnace using oil as a fuel, and we think that the cost of production can be brought down to a point where the phosphoric acid can be produced in competition with the sulphuric-acid treatment.

This phosphoric acid, like the ammonia gas from the Muscle Shoals plant, is in itself not adapted to fertilizers and is not, strictly speaking, a fertilizer material, as neither of them can be used in this form. The ammonia gas has to be fixed by absorption in an acid, and the phosphoric acid has to be fixed by neutralizing it with a base. The obvious thing to do with the phosphoric acid is to fix it by passing in ammonia gas and form ammonium phosphate, which is a concentrated and valuable fertilizer material. Here the proposals of the War Department and of the Bureau of Soils come together. The ammonia to be produced at Muscle Shoals will need to be fixed, and phosphoric acid will be more valuable for this purpose than sulphuric acid, while such phosphoric acid as may be produced in plants adopting the furnace method, which the Bureau of Soils has been developing, will need to be fixed, and the Muscle Shoals ammonia will be most suitable for this purpose.

Ammonium nitrate can probably be mixed in all proportions with ammonium phosphate. Furthermore, it seems likely that potash can be put into the mixture in the form of potassium phosphate which, it is believed, could also be mixed in any proportion with ammonium nitrate and with ammonium phos-

phate. This would give the most concentrated fertilizer that it is possible to make.

There are two important questions to solve before such investigative work can be applied on a commercial scale. If concentrated fertilizers are made on a commercial scale, will the farmers be willing to use them, and can the country absorb the amount of ammonia that can be produced by the Muscle Shoals plant without disorganizing existing commercial sources?

The farmers have always been inclined to criticize the fertilizer manufacturers for selling fertilizers that contain a considerable amount of valueless material which they class as filler. When they buy acid phosphate they only get 16 per cent phosphoric acid figured as P_2O_5 . The rest is inert and more or less valueless material. When they purchase ammonium sulphate, the ammonia equivalent is not over 25 per cent; in nitrate of soda, the ammonia equivalent is not over 20 per cent; in muriate of potash, the actual potash equivalent is not over 50 per cent; and in cottonseed meal, the ammonia equivalent is about 8 per cent. If there was put on the market a concentrated fertilizer made of the materials above described a standard formula containing 2 per cent of nitrogen, 8 per cent of phosphoric acid, and 2 per cent potash would contain in the concentrated form and, without filler, about 12 per cent of nitrogen, 49 per cent of phosphoric acid, and 12 per cent of potash. If this were diluted to correspond with the formulas the farmer has been accustomed to buy, it would require nearly 84 per cent of filler. A fertilizer containing 10 per cent of nitrogen, 8 per cent of phosphoric acid, and 4 per cent of potash in concentrated form would carry 24 per cent nitrogen, 19 per cent of phosphoric acid, and about 10 per cent of potash. It would require to dilute it to the present concentration 59 per cent of filler.

In applying concentrated fertilizers considerably more care has to be exercised than in applying the ordinary commercial fertilizers of commerce. The farmer would save freight on the filler unless he desired to have the fertilizer manufacturer put in the filler at the factory. The railroads would save car space if concentrated materials were shipped. If the farmer purchased a concentrated fertilizer he could apply it as such, but he would have to use more care and not let it come in direct contact with the seed, at least if it were applied in the drill. He could dilute the concentrated fertilizer by adding dry sand or finely divided and dried peat or soil of any kind, or he could dilute it with water, if he had conveniences to apply the fertilizer in a spray. The question is whether the farmer would adapt himself to concentrated fertilizers and whether there would be a market for such material.

I have asked you to express an opinion as to whether the country could absorb the ammonia that could be produced at the Muscle Shoals plant without seriously disturbing the present commercial production of ammonia in its different forms. In order that you may judge this question intelligently let me say a few words about the present supplies and present markets for fertilizers.

The rated capacity of the Muscle Shoals plant is 56,716 tons of ammonia (NH_3) per annum. It is not contemplated for the present, however, to run the plant at full capacity, as only 8 of the 10 units will be run at any one time. This would mean a capacity of 44,440 tons per annum of ammonia, equivalent to 168,000 tons of ammonium sulphate. If this ammonia, instead of being made into ammonium sulphate, were made into concentrated fertilizers, the output would be equivalent to some 2,000,000 tons of mixed fertilizer of average grade, but it would, of course, be far less in actual weight, though quite the equivalent in crop-growing value, as they would contain no inert material.

In 1909 the production of ammonium sulphate was about 106,000 tons, while in 1904 the production was something less than 55,000 tons. The present rated capacity of the by-product coke ovens and city gas plants is probably between 500,000 and 600,000 tons of ammonium sulphate per annum. The actual production in 1919 was only about 423,000 tons, of which about 140,000 tons were exported. On account of the coal strike, the railroad strike, and the car shortage the supply has been inadequate, and would have been inadequate if the 140,000 had not been exported. It is believed that the maximum recovery of ammonium sulphate from coke ovens may in the course of a few years be increased to 700,000 tons per annum, but that this is the limit of capacity unless the demand for pig iron is constantly and largely increased. The increased production of ammonium sulphate has been used to a considerable

extent in replacing the ammonia from the organic ammoniates which have been rapidly absorbed as feed.

From a thorough survey of the fertilizer industry made by this department in 1917 and 1918 it appears that of all the materials sold by the fertilizer manufacturers in 1917, 3.3 per cent was ammonia. This figure has been used in the preparation of the table which follows.

It has been estimated by the War Department that for 15 years (1899-1914) the annual rate of increase of fertilizer production was $7\frac{1}{2}$ per cent compounded annually; that is to say, that each year the production of fertilizers was approximately $7\frac{1}{2}$ per cent larger than for the year before. The capacity of the coke ovens has nearly reached its maximum. The proportion of the organic ammoniates available for fertilizers is rapidly decreasing. The importation of nitrate of soda is limited by the shipping facilities, so that the time must soon come, if in fact it has not already arrived, when the country must turn to the use of fixed-nitrogen products to supply the ammonia for the increasing amounts of fertilizers that will be needed.

The situation may be presented from another point of view. The war interfered with the fertilizer trade as it has with many other industries. If the normal increase of $7\frac{1}{2}$ per cent yearly in the fertilizer output had continued from 1914, the production of fertilizer in 1919 would have been about 10,500,000 tons. In 1914 the production is given as 7,367,528 tons, in 1915 it was 5,586,212, in 1916 it reached its low point of 5,407,549 tons. From then it began to rise. In 1917 it was 6,224,548 tons, in 1918 it was 6,779,743 tons, in 1919 it was 6,927,322 tons, or somewhat less than 1914. It would appear, therefore, that the production in 1919 was less than it would have been on the basis of the normal increase by some 3,849,717 tons.

This decrease of fertilizer production during the war period was not due to lessening demand, but was due to the inability to obtain material. The foreign potash supply was cut off, the phosphate rock could not be mined or transported, the sodium nitrate and ammonium sulphate were diverted in large part to munitions, and the organic ammoniates were used to a large extent for feeding purposes. In 1919 the potash situation had not recovered its normal volume. The strikes in the Florida phosphate fields and the car shortage made acid phosphate hard to obtain, and it was found that the organic ammoniatets had not been released by the feeders. If the fertilizer manufacturers had been required to produce 3,500,000 tons more fertilizer in 1919 than was actually produced, it is not apparent where the ammonia supply would have been drawn from. The phosphate rock that was not used for fertilizers is still in the ground, the potash that was not used is still in the mines, but the organic ammoniates have been completely used up, either as fertilizers or as feeds. It seems apparent, therefore, that the country has been short of fertilizer material for the past five years, and if this shortage is to be made up and provision made for a resumption of even the normal annual increase additional sources of ammonia must be found. The only place to look for this increased supply of ammonia is in fixed-nitrogen products.

The latest comparable figures showing the intensity of use of commercial fertilizers in European countries and in the United States pertain in 1912. From the figures obtainable for that period it appears that Germany was using 188 pounds per acre of land in crops; Great Britain, 162 pounds of fertilizer per acre of land in crops; France 79 pounds; Italy, 77 pounds; the United States, 40 pounds; Spain, 31 pounds; and Russia in Europe, 6 pounds per acre.

The following table shows the acres in crops as determined by the Bureau of Crop Estimates (Crop Reporter for March, 1920), the tonnage of fertilizers sold in each State (the American Fertilizer Handbook, 1920), the estimated amount of ammonia contained therein (estimate, 3.3 per cent), and the additional amount of nitrogen that would be required to bring the practice in the several States at least up to the present rate of use in Georgia. There are nine States that use more fertilizers per acre of land in crops than Georgia. Georgia was selected as a basis of comparison, because the intensity of use is nearly the same as in the United Kingdom, and is less than the practice in Germany in 1913, and because of the general agriculture practiced as against the specialized use in Florida and in some of the other coast States.

Total acreage in crops in 1919, the tonnage of fertilizers sold in each State, and the additional amount of ammonia required to bring the intensity of use at least up to the present practice in Georgia.

State.	In crops.	Fertilizer used in 1919.		Ammonia used.	Additional required.

We have always thought of the agriculture at least of northern Europe as being of the most intensive kind with the use of a relatively large amount of fertilizers. It appears from this table, however, that already in 10 of the States of this country the use of fertilizers is more intensive than in the European countries.

The following table shows the fertilizer tonnage in 1913 and in 1919 as taken from the American Fertilizer Handbook, together with the increase or decrease in 1919 based upon the 1913 figures:

State.	Fertilizer tonnage.		Per cent.	State.	Fertilizer tonnage.		Per cent.

¹ Exclusive of Porto Rico.

NOTE.—Increase or decrease (—) in 1919, compared with 1913.

From the first table showing the intensity of use and from the second table showing the actual sales it would appear that the intensity of use in the so-called fertilizer States has already reached the maximum application. It has long appeared to students of agriculture that the future development in the fertilizer industry would be in its extension westward into the so-called corn and wheat States and the Central and Southwestern States. The increase shown both by tonnage and by percentage in the East North Central States as compared with the New England, the Middle Atlantic, and the South Atlantic States is significant and appears to show the westward trend in the use of fertilizers while individual States, such as Oklahoma, Arkansas, Kentucky, Tennessee, and Missouri, appear to emphasize the same fact.

With this data before you and the knowledge of local conditions, I should be very glad to have you give me your best judgment in answering the questions on the inclosed questionnaire. The questions which the bureau has to answer and which we hope to be able more intelligently to answer from your questionnaire are as follows:

(1) If the Muscle Shoals plant operated by the Government or by private enterprise should within a period of three years be prepared to produce annually 168,000 tons of sulphate of ammonium, could this country absorb this, either for straight application to the soil or in mixed fertilizers, without seriously interfering with production by private capital?

(2) If the Muscle Shoals plant instead of producing sulphate of ammonium produced concentrated fertilizer materials such as ammonium nitrate, ammonium phosphate, and potassium phosphate, which could be mixed in many proportions by the farmers themselves or at Muscle Shoals or by fertilizer manufacturers, would the farmers be willing to use such concentrated materials either in mixed fertilizers or in straight application just as he employs nitrate of soda, ammonium phosphate, acid phosphate, and would he take the pains which he must now take with nitrate of soda to use it so that it will not damage the crop by coming undiluted into intimate contact with the seed at planting time?

(3) If the farmers would accept the concentrated form of fertilizers, could the country absorb the equivalent of 2,000,000 tons of fertilizers carrying 44,440 tons of ammonia in addition to what is now produced?

I have purposely refrained from discussing prices as these are relative and are dependent upon many conditions in the business world. It must be assumed that the fixed nitrogen products will have a relative value comparable with the ammonia derived from other natural sources.

Very truly, yours,

MILTON WHITNEY,
Chief of Bureau.

QUESTIONNAIRE.

1. With this information before you and your knowledge of local conditions, is it your opinion that if fertilizer material, especially the ammoniates, were produced in large amounts, through the operation of the Muscle Shoals plant, there would be a larger market in your State for fertilizers or fertilizer material; and if so, approximately how much greater than in 1919?

Increase, per cent, _____.

Decrease, per cent, _____.

2. If suitable methods can be developed for the manufacture of concentrated fertilizers at Muscle Shoals, would you favor the manufacture of ammonium sulphate, or of concentrated fertilizers, or of fertilizer materials at that point?

Ammonium sulphate, _____.

Concentrated fertilizers, _____.

3. If the Muscle Shoals plant, instead of producing sulphate of ammonium, produced concentrated fertilizer materials, such as ammonium nitrate, ammonium phosphate, and potassium phosphate, which could be mixed in any proportion by the farmer himself, or at Muscle Shoals, or by fertilizer manufacturers, would the farmer be willing to use such concentrated material either in mixed fertilizers or as straight applications just as he now employs the commercial grades of nitrate of soda, ammonium sulphates, acid phosphates, or other readily soluble fertilizer salts in straight applications, and would he take the pains to use it so that it will not damage the crop by coming undiluted into intimate contact with the seed at planting time?

Answer yes or no.

Please write on a separate sheet other information or discussion you desire to give and inclose in the penalty envelope without postage and return to the Bureau of Soils.

Following is the list of States, showing the consumption of fertilizers for the fiscal years ending in 1912, 1913, 1914, 1915, 1916, 1917, 1918, and 1919, compiled from the most reliable statistics that are obtainable. In some of the States there are absolutely no accurate figures available. For the States indicated by an *, estimates have been made based on information obtained from State officials and fertilizer manufacturers.

SEPTEMBER 27, 1920.

Col. J. H. BURNS,

Nitrate Division, Ordnance Department, Washington, D. C.

DEAR COL. BURNS: In line with the cooperative work we have been carrying on concerning the operation of the Muscle Shoals plant, as well as the Haber process, and after consultation with you, I addressed a letter on August 14, 1920, to the commissioners of agriculture and directors of the experiment stations of the several States to obtain their opinions on certain phases of the problem. It seemed to me that they were in a position to advise in regard to fertilizer problems, as they either have charge of the administration of the fertilizer laws of the respective States or have been vitally interested through their investigational work in the general fertilizer problem.

In this letter I laid before them in some detail the present status of the fertilizer industry and the relative intensity of use in the several States, asking them to give their judgment, so far as their State is concerned, as to whether, and approximately how much, additional fertilizers would be used in their States in the event that a larger supply of fertilizer material, especially nitrogenous material, were made available through the operation of the Government plant, in order that I might determine whether the production of 168,000 tons of ammonium sulphate could be absorbed by the country without seriously upsetting the present industrial relations.

I sent these letters to representatives in 48 States. I have received up to date replies from 37 States. These 37 States represent 89 per cent of the tonnage of fertilizers in 1919. I sent out 85 letters and have received to date 46 replies.

Three States did not express an opinion as to whether or not there would be an increase in fertilizers used in these States if larger amounts of nitrogenous material were supplied. These States in 1919 had a total consumption of 22,937 tons out of a total of 6,927,322 tons used in all States in 1919. Three States which consumed 29,000 tons looked for no increase in use in their States. Eight States which consumed 1,053,102 tons in 1919 expressed the opinion that there would be an increased use, but did not state how much. Twenty-three States which consumed 5,070,744 tons gave the probable per cent of increase. The average weighted increase to be expected, according to the judgment of the officials of these 23 States, is about 17.2 per cent. This, applied to the total tonnage of 1919, would indicate that 1,191,499 additional tons of fertilizers could have been consumed if the fertilizer material had been available. If we use the factor 3.3 per cent for the ammonia content, it would be equivalent to 157,276 tons of ammonium sulphate. This is close to the estimated capacity of the Muscle Shoals plant. In no case was any doubt expressed by the officials that the product of the Muscle Shoals plant could be absorbed without serious disturbance to commercial production.

My opinion, previously expressed to you, that the production of 168,000 tons of ammonium sulphate could be absorbed into the fertilizer industry of this country is thus confirmed, as, if I had taken their maximum estimates, the amount stated by them which could be used would considerably exceed this figure.

The general opinion of the correspondents is that there is at present and has been for a long time a serious shortage of fertilizer materials, especially of the nitrogenous materials, and they seemed to feel very strongly that the operation of the Muscle Shoals plant, with the production of fixed-nitrogen compounds, would be of great benefit to agriculture.

I called the attention of the State officials to some of the difficulties in the use of fixed-nitrogen products, such as cyanamid and ammonium nitrate, in the system that has always prevailed in this country of depending largely upon mixed fertilizers. I also called attention to the waste of phosphate-rock material in the present system of acidulating with sulphuric acid. I suggested that this waste could be eliminated by the preparation of liquid phosphoric acid from mine-run material and from low-grade rock, which could then be fixed by introducing potash or ammonia, with the formation of potassium phosphate or ammonium phosphate, to which ammonium nitrate could be added without chemical change taking place. I told them that in my judgment the time had come to put the fertilizer industry on a real chemical basis.

After laying before them such details and such opinions of my own, I asked them whether, in their judgment, the Muscle Shoals plant should produce ammonium sulphate or should produce concentrated fertilizer material of the above kinds. Four States, which used in 1919 a total of 17,000 tons, expressed no opinion on this point. Two States, which used 46,500 tons, advised that

ammonium sulphate be produced. Thirty-one States advised the manufacture of concentrated fertilizer materials. These 31 States represent practically 99 per cent of the tonnage of 1919 from those States reporting and about 87 per cent of the total tonnage of all States in 1919.

I further asked my correspondents if in their judgment, if concentrated fertilizers are produced, the farmers would take pains to apply them with the same care that they now have to exercise in applying straight nitrate of soda or acid phosphate so that they will not come into direct contact with the seed at planting time. All of the correspondents who favored the production of concentrated fertilizers expressed the opinion that with suitable warning and a campaign of education the farmers could and would use concentrated fertilizer materials safely.

I trust this information will be of interest and value to you.

Very truly, yours,

MILTON WHITNEY,
Chief of Bureau.

Mr. FIELDS. Doctor, from your study of the subject, what has been the average increase in the production of corn by the use of fertilizer? If you will put in the hearing a table showing the average increase in the yield of the staple crops of the country by the use of fertilizer it will be of great assistance to the committee.

Dr. WHITNEY. I think it will be very difficult to state that in any fair way. We have not the information in regard to general use. We have the information in regard to some of the fertilizer experiments that have been carried on in this country, but it is hardly fair to apply those to general use.

Mr. FIELDS. Any figures you could give us to show the benefit of fertilizer applied to the soil in the production of crops would help us.

Dr. WHITNEY. I will try to get up some data that will be satisfactory.

Average increase per acre of all fertilizer experiments in the United States published up to 1910, with the number of experiments reported up to that time.

Fertilizer.	Corn.		Wheat.		Potatoes.		Cotton.	
	Number of experiments.	Average increase in bushels.	Number of experiments.	Average increase in bushels.	Number of experiments.	Average increase in bushels.	Number of experiments.	Average increase in pounds.
Mineral fertilizers:								
Single fertilizer materials containing ammonia, from mineral sources, acid phosphate, or potash.....	1,622	3.7	799	2.0	295	10.5	559	54.0
Minerals in combination of two of the above elements.....	1,036	11.0	378	4.6	254	29.6	280	82.5
Complete mineral fertilizer containing all three of the above elements.....	1,233	14.5	534	8.9	226	48.5	311	160.4
Organic fertilizers:								
Single organic fertilizer material..	302	4.6	151	2.2	60	23.7	209	72.0
Organic fertilizer material in combination with acid phosphate or potash.....	364	7.2	161	3.7	128	49.3	469	109.4
Complete fertilizer containing ammonia in organic form, acid phosphate, and potash.....	1,037	10.8	377	7.5	269	53.5	730	130.3

These summaries include all published records regardless of the character of the soil, the climatic conditions, or the length of time fertilizers have been applied, or the previous treatment of the soil. They are, however, the best summaries that can be presented at this time.

Mr. Chairman, there is a great deal of information regarding that matter. The Bureau of Soils compiled all the results from all the experiments that had been made with fertilizers about 10 years ago and has published a bulletin analyzing the whole question. But it is very hard to draw a general comparison because we do not know the soils that they were used on, and we know nothing except the figures. We have to accept those as they come.

Mr. FIELDS. I want to get back to the subject of the filler used in the fertilizers. Did I understand you to say early in the hearings that much of the filler used in fertilizer was contained in the product shipped from Germany?

Dr. WHITNEY. It is used in products from our own country. For example, we use acid phosphate that carries only 16 per cent of phosphoric acid. The rest of it is filler. In our ammonium sulphate we absorb our ammonia in sulphuric acid.

Mr. FIELDS. Do we get potash from Germany in concentrated form?

Dr. WHITNEY. Yes; potash comes to us in two forms—as muriate of potash and sulphate of potash, each having 50 per cent of K_2O . That is as concentrated as we can get it unless in making these concentrated fertilizers we get the potash in the form of phosphate of potash, potassium phosphate. Then it would not be a filler, but it would be a valuable constituent. Now, the sulphate and the chloride in which we get it from Germany are unnecessary, but they are the most concentrated forms we have unless we can make them in this country.

Mr. FIELDS. At any rate, if a farmer buys 2 tons of fertilizer of 16 per cent phosphoric acid, he is getting 640 pounds of fertilizer and 3,360 pounds of filler. In addition to the freight charges, he must pay for the handling of all this bulk.

Dr. WHITNEY. Yes; and also for the sacks.

Mr. FIELDS. And also the drayage, the expert men and the labor in handling it, which is a very large item in this type of fertilizer.

Dr. WHITNEY. Yes.

Mr. FIELDS. I believe you have referred to two or three methods for the application of this highly concentrated fertilizer that you have showed us here.

Dr. WHITNEY. Yes.

Mr. FIELDS. It could possibly be mixed with sand, as the phosphoric acid seems to be, and put on the soil by the farmer under instructions given, just as he must follow the instructions given in connection with the fertilizer he now buys?

Dr. WHITNEY. Yes; or it could be put on in its concentrated form. Or where large quantities are used, as on the truck soils and the citrus-fruit soils, it could be put on by sprays.

Mr. FIELDS. Judge Parker questioned you about the fertilization of the soil by stall feeding of cattle. My experience has taught me that that is a splendid way, but it does not supply enough fertilizer to meet the requirements of the farmer.

Dr. WHITNEY. No; the amount is insufficient, and besides that the difficulty and the expense of transporting such a bulky material as manure is very great. It is not practicable, except for intensive agriculture in the market gardens.

Mr. FIELDS. Take, for instance, the fertilizer from a 40-acre field of corn. If it is handled with the greatest care it would not fertilize that same number of acres. It would only fertilize a small part of that.

Dr. WHITNEY. Yes.

Mr. FIELDS. Put on by the most scientific methods, and, we will say, by the best manure spreader that could be had.

Dr. WHITNEY. Yes.

Mr. FIELDS. It probably would not fertilize one-fifth of that area. Judge Parker also referred to the fertilization of the soil by the growing of cowpeas, which is another splendid method, if you need to produce cowpeas as an agricultural product.

Dr. WHITNEY. Yes.

Mr. FIELDS. But it is a very expensive method if you are producing that for the fertilization of the soil alone.

Dr. WHITNEY. Yes.

Mr. FIELDS. In countries which are not adapted to the production of cowpeas, where it is difficult to save the seed, the farmer must buy his seed as is the case in my country largely. My experience has been that if he buys the seed, then the cowpea seed will cost more than the fertilizer, and in addition to that there is the cost of plowing the land and planting the crop.

Dr. WHITNEY. And losing the use of the land for other purposes.

Mr. FIELDS. For one year.

Dr. WHITNEY. Yes.

Mr. STOLL. The main object of plants like plant No. 2 at Muscle Shoals, I believe you stated, was to make fixed nitrogen. What do you mean by fixed nitrogen?

Dr. WHITNEY. It is really the free nitrogen of the air, which is very inert and very difficult to react, to fix that in some form in which it will be active and beneficial to the crops.

Mr. STOLL. What form must it be in to be beneficial to the crops? What do you call it when it is in the shape that will be beneficial to crops?

Dr. WHITNEY. In a general way we speak of it as ammonia, because that is the simplest form.

Mr. STOLL. That is what I thought.

Dr. WHITNEY. But it may be put into the form of cyanamid, or urea, or nitrate of soda, or ammonium sulphate, but we fix it in a way so that we designate it as a fixed nitrogen product.

Mr. STOLL. The farmer understands it as ammonia.

Dr. WHITNEY. He would value it as ammonia.

Mr. STOLL. In what form is ammonia used for fertilizer? Is it in the sulphate?

Dr. WHITNEY. It is used in the form of ammonium sulphate; but it is referred to as ammonia, even when it is present as nitric acid in sodium nitrate, or as in organic forms of nitrogen in cottonseed meal or tankage.

Mr. STOLL. What I am after is to find what you get out of the air. It would be sulphate of ammonia you would get out of the air, would it not?

Dr. WHITNEY. No; in the case of the Haber process, it would be straight ammonia gas. In the case of the cyanamid process, it would be, as Dr. Tolman told you yesterday, cyanamid from which ammonia can be made by heating it under pressure by steam.

Mr. STOLL. Dr. Tolman, who testified yesterday stated, I believe, that nitrate plant No. 2, if it makes 110,000 tons of nitrate would yield about 190,000 tons of sulphate of ammonia.

Dr. WHITNEY. No; it will make either. It will not make both. You can get your ammonia out from your cyanamid and you can convert part of it into nitric acid and dissolve the rest of the ammonia gas into nitric acid and make ammonium nitrate, or you can dissolve some of the ammonia gas into sulphuric acid and make ammonium sulphate.

Mr. STOLL. But what I am especially after now is the statistics. If we get 190,000 tons of sulphate of ammonia, that would be in form to be used as fertilizer.

Dr. WHITNEY. Yes.

Mr. STOLL. What per cent of fertilizer now used is sulphate of ammonia?

Dr. WHITNEY. That is very difficult to tell; very difficult. In 1917 and 1918 the proportion of ammonia used in fertilizers that was derived from ammonium sulphate was between 16 and 17 per cent.

Mr. STOLL. Perhaps I can get at what I want in this way, what other sources of ammonia have we?

Dr. WHITNEY. We have nitrate of soda, and about 29 per cent of all the nitrogen in our fertilizers in those years was derived from sodium nitrate. Then we come down to the animal tankage which is one of the organic forms or nitrogen or ammonia, and there was about 15 per cent derived from animal tankage. There was about 2 per cent derived from garbage tankage. There was about 2½ per cent from dried blood and about 14 to 15 per cent from cottonseed meal. There was about 2 per cent from fish scrap and the rest was from small sources, waste materials.

Mr. STOLL. Can you state how many tons that would be in the shape of fertilizer or ammonium sulphate.

Dr. WHITNEY. Yes, knowing the number of tons that were produced that year, we could, of course, arrive at that.

Mr. STOLL. I wish you would put in the record the number of tons of ammonia we now use. Have we got a sufficient supply of it?

Dr. WHITNEY. As I tried to show a while ago, we have a sufficient supply. We have an overabundant supply just now of nitrogen, in all its forms, because the farmers did not purchase last year.

Mr. STOLL. I understand that, but I mean under normal conditions have we enough.

Dr. WHITNEY. Under normal conditions, of course, we have been keeping up with the demand for fertilizers, but there has been an impossibility of getting nitrogenous material in sufficient amount for any great expansion of the use of fertilizers. I have had this matter up with the fertilizer manufacturers. If they were successful in getting a demand of 2,000,000 tons of fertilizers in the wheat and corn States, we then could not get the nitrogen to supply it.

Now, one of the reasons that the use of fertilizers has not been pushed more rapidly is that the supply, particularly of nitrogen, has been insufficient to meet any rapid increase or drastic increase in the amount of fertilizers that would be required. Just now we have a surplus of fertilizer material, but under normal conditions we would expect about 8,000,000 tons. If it had not been for the war I think the expectation would have been at this time about 9,000,000 or 10,000,000 tons. The limitations on the amount of nitrogen by the increase in the use of fertilizers, and particularly by the increase in the amount that is fed to cattle, would make it very difficult for us to manufacture normally now 10,000,000 tons of fertilizers.

Mr. STOLL. In the formula of 8-3-3, which is the one most commonly used in my State—South Carolina—how much ammonia is in that formula?

Dr. WHITNEY. There are three units of ammonia and a unit is 20 pounds, so there is 60 pounds of ammonia in a ton of fertilizer.

Mr. STOLL. If there is 60 pounds of ammonia in a ton of 8-3-3, and about 200,000 tons of ammonia can be manufactured at nitrate plant No. 2, that would furnish almost all the ammonia needed in the formula of 8-3-3, would it not?

Dr. WHITNEY. For the country or for 8,000,000 tons?

Mr. STOLL. Yes.

Dr. WHITNEY. No; I showed a while ago—

Mr. STOLL. That would make around 8,000,000 tons of fertilizer, would it not?

Dr. WHITNEY. I showed a while ago in my letter that is quoted by Senator Smith in the Congressional Record of January 7, 1921, that we were using at that time 227,833 tons of nitrogen. Now, I understand the capacity of the Muscle Shoals plant to be about 40,000 tons of nitrogen.

Mr. STOLL. No, sir; Gen. Williams said it would produce about 200,000 tons of sulphate of ammonia.

Dr. WHITNEY. Two hundred thousand tons of sulphate of ammonia.

Mr. STOLL. And I think Dr. Tolman said about 190,000 tons.

Dr. WHITNEY. And 110,000 tons of ammonium nitrate, but the production of nitrogen is about 40,000 tons.

Dr. TOLMAN. One hundred and ninety thousand tons of ammonium sulphate contains about 40,000 tons of nitrogen.

Dr. WHITNEY. And we are using 227,000 tons of nitrogen.

Mr. STOLL. I thought it would produce 190,000 tons or 200,000 tons of fertilizer material. That is where the mistake comes in.

Dr. WHITNEY. Yes; of course, you know, in figuring these things, 40,000 tons of nitrogen to be converted into ammonium nitrate has to be converted first into ammonia and then into nitric acid, so that by the time you have oxidized and added to it you get out of your 40,000 tons of nitrogen 110,000 tons of ammonium nitrate or 190,000 tons of ammonium sulphate.

Mr. STOLL. I notice from the statement that has been submitted here that my State uses about one-sixth of the fertilizer used in the entire United States, and using more than any other State I thought that if this would make all the ammonia needed it would be a very important item.

Dr. WHITNEY. No; it is only a part. It is 40,000 tons as against 227,000 tons.

Mr. PARKER. Doctor, I am somewhat puzzled by your formula of 8-3-3. You said "3" was the ammonia in the other figures, and I thought the first one represented ammonia, the second one phosphorous, and the third potash, but in the 8-3-3 you made the ammonia "3."

Dr. WHITNEY. Let me tell you about that. That is a difference in practice between the North and the South. In the Northern States the ammonia is always given first, and that would be 3-8-3. In the Southern States the phosphoric acid is invariably given first, and the same formula would be written 8-3-3.

Mr. PARKER. That is to say, in each case it means 8 of phosphoric acid.

Dr. WHITNEY. Eight of phosphoric acid.

Mr. PARKER. Three of potash.

Dr. WHITNEY. Three of potash.

Mr. PARKER. And 3 of ammonia.

Dr. WHITNEY. Yes, sir.

Mr. PARKER. That makes it plain. I now want to ask you one other question. Something has been said about cowpeas; all beans and peas take ammonia from the air, do they not?

Dr. WHITNEY. Yes; all leguminous plants.

Mr. PARKER. And some of them will ripen in any climate, for instance.

Dr. WHITNEY. Yes.

Mr. PARKER. If you take any soil on a farm, all the nitrogen that is in it has been brought there from the air by plants, if it has not been fertilized?

Dr. WHITNEY. Well, we are uncertain about that. We would not say that. We do not know.

Mr. PARKER. On the ordinary farm there are no nitrates?

Dr. WHITNEY. Oh, yes.

Mr. PARKER. As to the potash; that comes out of almost every pebble, especially if they come from granite rock.

Dr. WHITNEY. Yes, sir.

Mr. PARKER. And as those pebbles break into smaller pieces more potash is formed.

Dr. WHITNEY. Yes, sir.

Mr. PARKER. As to the phosphorus, that is about the same, too. It does not come from the air, but certain parts of the mineral on every farm contain some phosphorus, or ought to.

Dr. WHITNEY. Yes.

Mr. PARKER. But very little.

Dr. WHITNEY. It is a small amount; yes.

Mr. PARKER. And there is quite a quantity of potash, if it can only be put in usable form on almost every farm?

Dr. WHITNEY. Yes, sir.

Mr. CROWTHER. I have just one question, Doctor. You exhibited this morning two specimens of fertilizer with different formulas and you read the formulas. Did either of them contain nitrogen in the sulphate form or ammonium sulphate?

Dr. WHITNEY. No, sir.

Mr. CROWTHER. They were not present in either of those formulas that you exhibited this morning?

Dr. WHITNEY. No, sir.

The CHAIRMAN. Doctor, we are very much obliged to you and thank you exceedingly for your patience and kindness.

Dr. WHITNEY. I have been very glad to be with you.

(The committee thereupon adjourned until Thursday, February 16, 1922, at 10.30 o'clock.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Thursday, February 16, 1921.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. Gentlemen, Mr. Worthington, who was not feeling very well yesterday, and who is not feeling particularly strong this morning, is here to make his statement and to answer such questions as the committee may desire to ask.

STATEMENT OF MR. J. W. WORTHINGTON, CHAIRMAN OF THE EXECUTIVE COMMITTEE OF THE TENNESSEE RIVER IMPROVEMENT ASSOCIATION.

The CHAIRMAN. Mr. Worthington, will you kindly proceed in your own way and tell us what you have to say in reference to the offer of Mr. Ford regarding the Muscle Shoals property?

Mr. WORTHINGTON. Well, Mr. Chairman, I hardly know what to say to you unless I knew what you desired to be told to you.

The CHAIRMAN. Have you been following the hearings?

Mr. WORTHINGTON. I have read the hearings.

The CHAIRMAN. Is there anything you desire to add to what Mr. Mayo told us the other day?

Mr. WORTHINGTON. Well, perhaps, not on the line of his statement and not so much as speaking for Mr. Ford, I think I would like to make a statement somewhat on my own account, and I make that explanation because I think that Mr. Ford would be displeased with me if I was to say anything that was in the nature of an appeal to this committee that they accept his offer. He has expressed himself to me as very much opposed to anything of that sort.

However, there are some phases of the case I would like to get in the record.

The CHAIRMAN. Would you kindly state those phases?

Mr. WORTHINGTON. There is a phase of this case that seems to me, according to my view, very much misunderstood. Take the case of the Warrior River steam plant, and I am sure that any one who looked into the question would understand why Mr. Ford included it in his offer. The steam plant at nitrate plant No. 2 when running at capacity will require, perhaps, 1,500 tons of coal daily.

The CHAIRMAN. 1,500 tons daily?

Mr. WORTHINGTON. Daily; and nobody who knows Henry Ford would ever think he would pay a railroad \$1,500 or more a day to haul that coal up there if he used that plant, and so it was most natural for him to have included the steam plant in his proposition. Not only so, but at nitrate plant No. 1 you have a steam-power development of 5,000 kilowatts; but, of course, if this offer of Mr. Ford is accepted, you can see at once that he would move that down to the coal instead of hauling coal up to it. So his offer for the Warrior River steam plant was in, keeping with his intention and purpose all through his proposal; that is, economy.

I wanted to clear that up. There was an economical, sound reason for the proposal. In addition to that, while this committee, of course, will make its own decision, that power down there is needed to supplement the secondary power at the dam of the United States, and that is so plain from the record as not to require any discussion whatever.

There are some other phases of this case which I think are not understood. As I read the report of the Secretary of War and his statement and some of the other statements made before this committee, I am quite certain they do not understand Mr. Ford, and I will confess to this committee that it took me a good

long time to get such little understanding as I have of him. And I mean by that statement that in my earlier negotiations with him I supposed he was like other business men I had met, that they wanted to make money, but he called me on that proposition more than once and said that that was not his purpose at all, and I have become firmly convinced that that is true. So you will see, Mr. Chairman, that he was a little different in that respect from most men, if that is true.

Perhaps you know that as it turned out, I carried this Muscle Shoals case to him at the request of the Chief of Engineers. I noted in reading the Secretary of War's testimony—and please do not understand that this is a criticism; far from it—that Mr. Ford seemed to be groping around in the dark about his enterprises. I think that is about the most inaccurate statement that could be made about Henry Ford, and I would like to relate to the committee a little incident that happened. Instead of his being a groper around in the dark, he is the most definite and direct-acting rapid-firing human motor that I ever met. I will give you an illustration. On June 6 this Muscle Shoals matter was presented to him and in the afternoon he looked over some of the maps with his chief engineer, Mr. Mayo, and after two hours' consideration, he jumped up and said, "Let us go to Muscle Shoals," and Mr. Mayo asked him when, and he said "At 8 o'clock this evening." I just offer that as a suggestion that he is not much of a groper. He is the most direct, rapid-firing institution that I ever ran against.

But I do not think it is a thing to be wondered at at all that the Secretary of War said that, because in my little way, in the last 10 years here in Washington, I have found it the most difficult thing in the world to get with you gentlemen any engineering contact, and if you will take the history of your power legislation, you seem to have listened to everybody except the engineers who knew about it. So it is not a surprising thing that the Secretary of War would make that comment, and it is not new to me, Mr. Chairman, that statesmen do not understand the man of genius in certain lines, because you gentlemen remember, no doubt, that Mr. Gladstone was asked to go to meet, right at the peak of his career, some of England's scientists. He was carried to Mr. Darwin, and it is said that Mr. Darwin understood just about as little of what Mr. Gladstone said to him as Mr. Gladstone understood about what Mr. Darwin said, and then they carried Mr. Gladstone to meet Faraday, and Faraday showed him the motor. Mr. Gladstone asked him, "Why, what is the use of it?" It stumped Faraday, but he arose to the occasion and said, "Tax it," and that is the way with this whole proposition of waterpower here in Washington. Everybody wants to tax it, which is not in the interest of the consumer.

On that side of taxation and the creation of taxable wealth, there is one phase of the case at Muscle Shoals that, as far as I have seen, you have not considered. You take the internal-revenue receipts for the fiscal year 1920 and you will find a very interesting thing. The State of North Carolina, after the Civil War, was the poorest State, perhaps, among all southern States. They had no coal, no iron, and were strictly an agricultural State. Their cotton interest and production were ruined by the Civil War, but, Mr. Chairman, did you know that North Carolina, in the year 1920, paid more Federal taxes than any State in the South, not excepting Texas; more taxes than any New England State, with the exception of Massachusetts; more taxes than Indiana, with Gary in it, and more taxes than Missouri and more taxes than West Virginia.

There is an explanation for that, and when that explanation is sought and truly found you will find that it is the development of water power in North Carolina, and, Mr. Chairman, I need not consume the time of the committee by making a similar and greater example of your own State of California.

So, suppose all of these claims about these hardships that the United States Treasury is going to suffer down there are true, is it a good investment? It is a business proposition that you can determine the facts about. If you want to lift the burden of taxation in this country, if you want to lift taxation, develop these water powers and put them to work creating the wealth to pay the taxes, and if you will investigate the subject right seriously and thoroughly (and, of course, you may say that I ought not to say that because you have done it; but I think you might look into it again), you will find some very remarkable things on the subject that have not yet been disclosed, so far as I know.

Suppose we take another viewpoint. You take the water power that is possible of development in the Pacific Coast States. You have a group of

States out there that have perhaps 40 per cent of all the power that could be developed in this country. Bear in mind, now, that it is only in the last few days, and I am not criticizing them at all, but it is only in the last two or three days that we see that the coal-mine labor and the rail labor are going to get together, and I do not expect that any member of this committee hopes to see very much reduction in the rates paid coal-mine labor and rail labor.

Mr. Chairman and gentlemen of the committee, there is a direct relation between the amount of power used per wage earner and the value of the product which it produces. In 1899 we were using 2.1 horsepower per wage earner, with a resulting value of products of \$2,400. By 1914 we had increased the amount of machine power, supplementing our man power, to 3.2 horsepower per wage earner, and the value of the products had correspondingly increased to \$3,400.

You can see, I think, from that, if you do not deny the statement as a fact, that if we are to progress and if we are to share the world's market we have got to place ourselves in the position of being able to compete with European labor by increasing the amount of power that we give each wage earner to supplement his own efforts, and we must not stop at any figure of 3 horsepower or 4 horsepower, but must carry it high enough to wipe out the difference in the labor wage paid here and abroad, and you can wipe it out with water power if you will develop it. But we satisfy ourselves in the United States, you know very well yourselves—I suppose we can talk among ourselves as American citizens—we satisfy ourselves about a great many things by just simply boasting about it, and we boasted that we have got more water power than any nation (and it need not be said to this committee, Mr. Chairman, that there has been a good deal said about water power in Congress of about 10 years), but what have we developed?

We, in this country, have not built a dam in 10 years in a single navigable stream, but Canada, in 1920, had 850,000 horsepower under construction.

The CHAIRMAN. What country is that?

Mr. WORTHINGTON. Canada.

The CHAIRMAN. Our neighbor on the north.

Mr. WORTHINGTON. Right across the line, and I can say to this committee that they are laughing up their sleeves at us, and I do not blame them. We deserve to be laughed at about it, because this water-power proposition would be the biggest joke that ever was in this country, except that it is so serious.

Now, you take Canada, the Chippewa development is just about to be finished, of 500,000 horsepower and an installation is being made of 150,000 horsepower, and a few days ago you perhaps noticed that 50,000 horsepower was put in service.

Now, the Secretary of War suggests to you, and I understand a great many people insist upon it, that Mr. Ford ought not to have proposed on Muscle Shoals unless he had been willing to come under your power act. Well, we will not consume the time at present, but if you wish it, I will hand this committee a parallel of what Mr. Ford proposes to do and what the water power act requires, and you will see that only perhaps in the period of 100 years does he, in any essential way, depart from your power act.

It is a matter of choice, I suppose, but Mr. Ford is one of those men who is very definitely opposed to a great many details, and he holds exhaustive bookkeeping and accounting not in very high esteem, and if anybody comes here under your power act, and complies with it, he must open a bookkeeping establishment here in Washington. There is no doubt about it.

Now, in regard to the 100 years, I am sure there has been a great misunderstanding of that matter. I would like, Mr. Chairman, to ask you and the gentlemen of this committee what has happened at Keokuk, which is indefinite, I believe, as to the period, what has happened there to teach that it ought to have been 50 years. What has happened at Hale's Bar to make you conclude that, and what has happened at Lock 12 on the Coosa River; and if nothing has happened and there is no experience there that enforces you to contend for 50 years, just why should you do it? And, after all, Mr. Chairman, what has the period to do with it? The question of rates is the telling thing, the deciding proposition. Every member of the committee will have to accept that view.

Now, in the case of Muscle Shoals, it does not make any difference who gets it, if any power is sold to the public, the rates are fixed by the authorities of the State of Alabama charged with the duty to do it; and I would just like

to ask you gentlemen, if you were renting a great big skyscraper and you were permitted to make the rates, just why would you want to reduce the time; and I suggest to you that I would not want to own anybody's skyscraper if I could make the rates, and that is just the way this proposition is about the making of rates for power.

The period has nothing to do with it, as I am sure a moment's reflection will cause this committee to decide, and if the United States or Congress ever decides that it must take over a water power, do you suppose they would wait 50 years if they found it necessary to do it? Why, of course not.

Now, how did the 50-year limitation ever get in there? It was a compromise and every one of you gentlemen who was a Member of Congress during that discussion knows it. It has nothing sacred about it. Why was it not 40 years or why was it not 60 years?

Now, finally, at Muscle Shoals, it is too big for 50 years. It takes too much capital to ever work it out in 50 years, and not only that, the secondary power at Muscle Shoals is such a large percentage of the power that it will take years and years to make it primary, and the most important single statement that Mr. Ford has made to me in the last two months, and on his own motion and without any coaching on my part, was when he said, "Well, if we get Muscle Shoals we will go up the Tennessee and build the dams on the main stream and tributaries and develop that power and improve the navigation, and we will not ask the United States for a single cent."

This Tennessee River program, gentlemen, is out of the usual class and clear out of any 50-year period. Now, you may find that there are those who will offer to take it on 50 years, but they have no such program as Henry Ford; not at all; and before I leave this 100-years question, I would like to cite this committee to what Germany is doing, and I am going to ask the indulgence of the committee to let Mr. W. G. Waldo, the consulting engineer of the Tennessee River Improvement Association, read for me, because I am not just fit to-day, if you have no objection to that.

The CHAIRMAN. There is no objection and we will be very glad to have the engineer read it.

Mr. WALDO. In the issue of July 26, 1921, of the magazine called "Power," there is an article entitled "Germany Developing Water Power," describing the project on the Neckar River which is a link of the Danube. The proposal is to build from 25 to 28 dams, and the ultimate development is only 70,000 horsepower. The quotation is as follows:

"While the ultimate object of the whole enterprise is the canalization of the Neckar and the linking of that river with the Danube, its immediate purpose should be seen in the harnessing of the Neckar and the generating of hydro-electric energy with a calculated output of 70,000 horsepower, equal to 300,000,000 to 400,000,000 kilowatt-hours. The whole scheme represents a bold attempt to render large industrial districts in the south of Germany less dependent on outside coal supplies and its success from a revenue-paying point of view will, in a measure, be linked with the future development of the south German coal market, and, above all, with inland coal prices and coal taxes.

"The entire project, covering the section of the Neckar from Mannheim to Plochingen—a distance of about 210 kilometers (130 miles)—provides for 25 to 28 dams. It is intended to start building operations at the five best-suited barrages without further loss of time and the first 700,000,000 marks' worth of obligations will shortly be issued. Completion of the scheme in its present form will take from 10 to 13 years. Concessions have been granted for a period of 100 years."

Mr. WORTHINGTON. There you find in Germany a case where there is only 70,000 horsepower against your 750,000 here, and how many dams are there?

Mr. WALDO. From 25 to 28.

Mr. WORTHINGTON. There are 25 to 28 dams for 100 years, and you have two dams of 750,000 horsepower and you want to cut the time down to 50 years.

I would be very glad if any member of the committee would like to ask any questions on this 100-years business that I could answer, because I do not think there is but one side to it and I am very honest in that.

The CHAIRMAN. Would you like to complete your statement and then have the committee ask you questions?

Mr. WORTHINGTON. I would be very glad to. There is a phase of this case at Muscle Shoals to which I would like to especially call the attention of the committee. The biggest man that has ever come to my State of Alabama was

Mr. M. H. Smith, president of the Louisville & Nashville Railroad; he was our J. J. Hill. He was the only big man at the head of any big corporation that I ever met, in the earlier discussions of this Muscle Shoals case, who was willing to get behind it. He is now dead, but has a very worthy successor in Mr. W. L. Mapother. In an address before the Chamber of Commerce at Birmingham a few days ago Mr. Mapother particularly dwelt upon the Muscle-Shoals-Ford case, and announced his indorsement of it, and he made this significant statement, Mr. Chairman. He said that if Mr. Ford developed this power and would let the L. & N. have it, he would electrify one of the divisions of the Louisville & Nashville Railroad; the one running into Muscle Shoals.

I would like, in making these comments on electrification, for the gentlemen from Washington, Oregon, and California to take particular notice.

The Chicago, Milwaukee & St. Paul Railway is operating a total of 646 miles electrically, and these figures are taken from a signed statement of the president of the road. They estimate that their electric operations save annually about 200,000 tons of coal and about 32,000,000 gallons of oil. The saving in avoiding the use of this fuel is not only the value of the fuel itself, but eliminates the hauling of nonrevenue-company fuel amounting to nearly one-quarter of the total revenue freight business. The 44 electric locomotives have replaced 120 steam locomotives, and it would have required 210 cars moving continuously to handle the coal for those steam locomotives on one division alone. If this power is generated even by steam in a central station, 100 pounds of coal will do the work of 200 pounds burned under the boiler of a locomotive, and if this power was supplied from water power on all the railroads of the United States the saving would total the enormous sum of 122,500,000 tons of coal, which is about 25 per cent of the total maximum output of the bituminous mines of the United States.

Electrification of railways doubles the capacity of their track and postpones by a long term of years the time when double tracking will be necessary.

Now, I insist that if nothing came out of this proposition at Muscle Shoals, if you accept Mr. Ford's offer, except the electrification of the railroads, it would be an example and a lesson that would be beyond anything that we can calculate to the interests of the United States, and I would like to speak particularly to the gentlemen who are from the Pacific Coast States, where you have nearly 40 per cent of the power. What effect will it have on you if the rail labor of the country and the coal labor ever get together and there is a strike, if your roads are electrified? You will not have to worry. Now, there is no doubting of that. That is not a matter of opinion.

Somebody may raise the question, "Well, will Mr. Ford let the L. & N. have the power?" Nobody who knows Henry Ford will doubt it a minute.

Now, it has been said that Mr. Ford does not pay enough interest; that he ought to pay more than 4 per cent. Now, that is right where Henry Ford is misunderstood, and I may say to you that he says that the money changers, some of them, have got to get out of the water-power temple, and this is what he means:

If you take a hydroelectric development with an investment of \$200 per horsepower and your money costs 2 per cent, you have got an interest charge of \$4 per horsepower per year. If the money costs you 3 per cent, you have \$6; if it costs you 4 per cent, it is \$8; if it costs you 6 per cent it is \$12; if it costs 7 per cent, it is \$14; and if it costs 8 per cent, it is \$16; and if it costs 9 per cent it is \$18; and if 10 per cent it is \$20.

Now, that is a charge that the consumer has to pay. His idea is that some way or somehow there ought to be a plan devised, a policy set up in this country to develop these powers without these shocking interest charges.

You may say that it makes no difference, but it does make a difference. It is the difference between cheap power and expensive power, because in the case of water power 75 or 80 per cent of the annual cost of the power is the cost of the money invested.

You can assume that a given development has an annual operating expense of, say, \$3 per horsepower; the overhead (or interest and retirement fund cost) is 68 per cent of the total annual cost per horsepower, with a 2 per cent rate for money: it is 75 per cent with a 3 per cent rate; it is 80 per cent with a 4 per cent rate; it is 83 per cent on a 5 per cent rate; and 85 per cent on a 6 per cent rate; 87 per cent on a 7 per cent rate; 88 per cent on an 8 per cent rate; 89 per cent on a 9 per cent rate, and 90 per cent on a 10 per cent rate.

Now, what does money cost for this power? Suppose Mr. Ford had said—and Henry Ford is able to pay it—"I will pay you 6 per cent." Who would foot the bill? The customer.

I think, or I hope, that that answers that side of it, because his unalterable intention and objective is to reduce the cost of power to the consumer and to the user. Nobody need doubt that.

In a recent publication of the *Electrical World* you will find a statement that shows the rate of interest on power securities, mortgage bonds, debentures, preferred stock, cumulative, and preferred stock, noncumulative, and, Mr. Chairman, without consuming the time of the committee, I suggest if you are interested in this subject of reducing the cost of transportation by rail by serving railroads with water power to operate them, that these figures will interest you.

The CHAIRMAN. May I suggest that you put that statement in the hearing?

Mr. WORTHINGTON. All right; we will be very glad to.

(The statement referred to follows:)

Electric light and power security issues in 1921.¹

Mortgage Bonds (average yield 7.35 per cent) :

6 issues at 5 per cent.....	\$5,080,000
27 issues at 6 per cent.....	104,154,000
2 issues at 6½ per cent.....	80,572,000
27 issues at 7 per cent.....	98,314,000
17 issues at 7½ per cent.....	50,937,000
12 issues at 8 per cent.....	17,156,000
91 issues.....	<u>306,193,000</u>

Debentures (average yield 7.99 per cent) :

2 issues at 7 per cent.....	8,600,000
2 issues at 7½ per cent.....	12,000,000
1 issue at 9 per cent.....	436,000
5 issues.....	<u>21,036,000</u>

Notes (average yield 7.44 per cent) :

1 issue at 5 per cent.....	1,750,000
1 issue at 6 per cent.....	600,000
1 Issue at 6½ per cent.....	2,000,000
8 issues at 7 per cent.....	41,700,000
2 issues at 7½ per cent.....	1,869,000
10 issues at 8 per cent.....	15,700,000
23 issues.....	<u>63,619,000</u>

Preferred stock (cumulative)—(average yield 7.94 per cent) :

9 issues at 8 per cent.....	25,313,000

Total of all issues of year..... 456,914,943

¹ *Electrical World*, Jan. 21, 1922, p. 133.

Mr. WORTHINGTON. Let us go back to the Pacific coast again which, by the way, is the most interesting section of the United States as far as water power is concerned. It is said that you have in that group of States out there 40,000,000 horsepower: Just suppose it cost \$100 of horsepower to develop that power, the annual reduction in cost of that total power development, if you got your money at 5 per cent instead of 8, would save you \$120,000,000 a year. If you got money at 4 per cent instead of 9 per cent, it would save you \$200,000,000 a year. Therefore the saving per million of horsepower developed at 5 per cent instead of 8 per cent is \$3,000,000 annually, and the saving per million of horsepower developed at 4 per cent instead of 9 per cent is \$5,000,000; mind you, per million of horsepower developed.

Now, I mean no disrespect to anybody at all, but I say to this committee, in the light of some years of study of the case and being around Washington and watching water-power legislation, that you have no water-power policy. No member of the committee takes up the gantlet on that proposition. The results of your power legislation answer and sustain what I have stated. I believe this water-power law was passed in 1920, I am not sure; am I right about that?

The CHAIRMAN. I think it was.

Mr. WORTHINGTON. Well, what has been done? Now, what have you done? The very latest interesting thing about the whole case is that the representatives of the power companies were before the power commission on November 21, and one of the leading authorities on the subject of power, Mr. M. R. Bump, the president of the National Electric Light Association, outlining the reasons for asking a hearing before the commission, in part, said:

"We understand that applications for permits have been filed before your commission for over 16,000,000 horsepower. This shows the public interest which indicates the national importance of the act. We wish to point out, however, that the mere filing of these applications does not at all signify development."

And right there I would like to ask this committee to contrast what is going on in Canada with your filings here.

"It is exactly similar in nature to the filing of myriads of mining or oil claims. The filings, which cost practically nothing, are in some cases duplications; they do not indicate any ability on the part of those who file to carry out the development, and in many cases they merely represent the dreams and the hopes of speculators. Many of these filings, however, we know have been made by men or companies of means solely with the hope that they will be able to develop independent water-power properties as soon as the present rules and regulations are made workable, as they feel confident must be done. The acid test as to the present rules and regulations is not at all the spectacular and very misleading applications for permits, but the amount of actual, bona fide construction now in actual progress. An investigation will show that there has been practically no financing of independent water-power projects of consequence under the present rules and regulations, but that, on the contrary, substantially all the material development where the United States Government is involved is by and on the credit of the large property holdings of the older companies not on Government land and based on the credit of their well-established business, antedating even the passage of the act itself."

Now, is it a reasonable thing for Mr. Ford to want to stay from under an unworkable law? That is the case on that side of it, and I want to say to the committee that I know if it can be shown to Mr. Ford that he is avoiding anything that will contribute to the cheapening of power and to the service of power in an economical way, that he will subscribe to whatever that is; but this thing of attacking him about it and not offering a good reason for it is all aside from the question, because this is a big business matter you are dealing with.

There has been a great deal said, I fear rather thoughtlessly, about the production of fertilizer at Muscle Shoals. I am not going to engage the attention of the committee on that subject at length. I will suggest, however, that we ought not to boast so much in this country if we can not do what Germany is doing. Germany has freed herself from her dependence on Chile for nitrogen, and I believe if Henry Ford goes to Muscle Shoals he will free the United States from dependence upon Chile; at least, he will do as well as Germany. I will not agree that he will fall in that.

Now, you have directed your attention, I think, too much perhaps to the subject of nitrates, and I see in the paper that a gentleman is going to appear before this committee, and you will learn from him that the country is so fortunate in that there is something else at Muscle Shoals except nitrates for the farmer, and that gentleman is Mr. Swann, who deserves more credit, according to my view, than any man in the United States to-day for what he has done at Anniston, Ala.

This subject can be discussed, as has been demonstrated for the last 15 years, at length.

Mr. Chairman, it was stated by Mr. Mayo that Mr. Ford would use all the power himself in connection with his proposed industrial operations at Muscle Shoals, and the committee might raise the question with me about bringing up this electrification of a portion of the Louisville & Nashville Railroad. There would not be any trouble about what Mr. Ford would do, because cheap transportation assures cheap rates on what he manufactures there, and he would be as much interested in getting those rates cheap as any other job that he undertakes to do. That is a plain case of ordinary business economy.

I want to go back, if the committee will indulge me, to this 100 years' business. I am not critical, but I want to show this committee how utterly absurd the whole thing is.

Here is a map of the Little Tennessee River, and it is one of the most wonderful power rivers in all the Southeast. It is very little known, and yet the Aluminum Co. of America—and that company knows a good water power—has practically controlled the power development on that stream. The Little Tennessee flows into the Tennessee down here at Lenoir City. As a matter of fact this development of the Aluminum Co. of America is in North Carolina, just over the Tennessee line. Their plan is seven dams, and No. 2 dam is already completed, with a capacity of 75,000 horsepower, and the power is being used at Alcoa, where the Aluminum Co. of America has an aluminum plant.

Now, gentlemen, the period that the American Aluminum Co. of America controls this river is perpetual. Just what is the common sense in saying that when the water of the Little Tennessee River serves the Aluminum Co. of America at Alcoa in the production of aluminum, it is without limit and when the same water gets into the Tennessee River and runs down the Tennessee and gets to Hales Bar, 27 miles below Chattanooga it there becomes 99-year water; and then when it gets to Muscle Shoals it is 50-year water? If there had been any other falls lower down toward the Ohio, I suppose it would have gone to the vanishing point. I submit to you in all common sense that that absolutely blows up that whole contention. Do not understand that I suggest that you interfere with the Aluminum Co. of America in their location. I do not suggest it to you at all, but I do suggest most respectfully to you, not as a threat either, that if it is attempted the Tennessee River Improvement Association will come here to Washington and fight it. There is no reason why that company should not go on making aluminum for 50 years, or for 100 years, or for 150 years. Of course, as to the rates, that is another matter which I do not need to discuss. But you will not control the price of aluminum by limiting the period of water service. You had just as well say that in regulating railroad rates the Interstate Commerce Commission will be controlled by the duration of a railroad's charter. It is all absurd. It just blows up itself, and there never was anything in it.

It ought to be changed. I do not suppose it ever will be.

You can see that map over there on the wall. Let us see if we can make this 100-year proposition, or 50-year proposition a little more ridiculous. These are the transmission lines of the southeastern power development. There are 750,000 horsepower developed in the Carolinas, Georgia, Alabama, and Tennessee. Those powers happen to be developed on streams that are said to be nonnavigable. But whenever the water gets into a stream where on the map the United States engineers have taken their brushes and colored it, it immediately becomes 50-year water. That is a fact; you know it is, Mr. Chairman, yourself.

I have not the strength to-day and I have not the ability either, but I do know a man who is strong, and he has the ability, whom I suggest you have before you before concluding these hearings. You ask him to describe to you his studies conducted under the War Industries Board with regard to power during the war in connection with this whole southeastern situation, and you will find that he will make statements that are most interesting to this committee with respect

to the coordination of these power developments. Now, I would like to know how you could coordinate 50 years with 100 years. You must take some basis. Then what would you do with this perpetual case, if you try to coordinate and tie in with that? The gentleman I referred to is Mr. Frederick Darlington.

The CHAIRMAN. Where can he be found?

Mr. WORTHINGTON. He can be found at the Westinghouse Co. in New York. In that connection, Mr. Chairman, you will remember his report, or the report made by his staff, which was printed and submitted by the United States engineers, I think signed by Col. Keller. If you are interested in the war preparedness side of this case, Col. Keller knows this waterpower question as related to that matter.

Our association is too poor to make exhaustive surveys, but you will remember you appropriated \$125,000 to make this supersurvey from here to Boston, and you will find some most interesting statements on the subject of electrification.

But as poor as we are, we made a little study. It is no more than a suggestion, but it shows how the super-power program might be worked out for Muscle Shoals, around to Birmingham, Atlanta, through the Tallulah Falls, and around through Roanoke, Charleston, Huntington, Cincinnati, Louisville, and Nashville. Of course, that does not mean the Tennessee River alone, because the Cumberland River has valuable powers, if you ever decide to survey them and find out what they are. The powers on the upper Tennessee have never been surveyed, and it is not known what they are. But they are controlled by the United States. That is just a little study we made.

If we had had \$125,000 we would have carried it out much further, but we did not have the money.

Now, Mr. Chairman, in respect to the fertilizer side of it, just a practical example: I suppose the members of the committee know that the cottonseed production in 1914 is reported at 1,901,467 tons. Of that tonnage, 881,000 tons went into fertilizer—food into the ground. Cottonseed meal has only 6 or 7 per cent of nitrogen. It is a crime to do that, because this nitrogen compound that the farmer uses is only 6 per cent nitrogen, which is about 30 cents a pound, with cotton seed at only \$40 a ton. We ought to get the nitrogen out of the atmosphere, ought we not, and stop boasting, so that the cottonseed meal can go to California, Illinois, and Washington to feed cattle, and so that it can go to Vermont and to Massachusetts. And then if there is any surplus it ought to go to Norway, Sweden, Holland, and other European countries. But now, what does the southern farmer use it for? He has not got anything else; nobody has ever taught him how to use anything else or where to get anything else. How in the world can that poor negro tenant in the South work that problem out?

You may think that on this proposition I am talking through my hat, but if Henry Ford goes to Muscle Shoals he will work it out.

I suppose you gentlemen know that it is stated by those who are best informed that we in this country passed the peak of food production per capita in 1898, and that importations are expected in 20 years, the way we are proceeding. What is the remedy? Make the soil more fertile, restore it, and increase production.

I do not think I should consume the time of the committee any further. I suppose the committee is informed about the increase in electric-furnace operations in this country. It is an industry by itself, new, and described very uniquely by a writer on the subject as silent and a secret.

Mr. Ford stated to me in these discussions that we will not have any secrets at Muscle Shoals. You will not find an industrialist in this country who will make that statement except Henry Ford.

The CHAIRMAN. Mr. Worthington, I believe you stated you carried to Mr. Ford the proposition that was drawn up by the law officers of the War Department of this Government?

Mr. WORTHINGTON. Mr. Chairman, I suggested at the time the Chief of Engineers sent out invitations to power companies and a great number of other companies that might be interested, that he send Mr. Ford an invitation just the same as the others, and the Chief of Engineers was a little surprised at it. But I told him certain things Mr. Ford was doing, some in connection with

power development. He sent the invitation, and within 48 hours, perhaps, the Chief of Engineers got a telephone message from Mr. Ford's office asking him to come up there. But he could not go, and he asked me if I would go and gave me a letter, or a copy of the letter he wrote to Mr. Ford, saying that he asked me to come. I got another letter of introduction from Senator Underwood, and with those I went there on June 6. Mr. Ford went to Muscle Shoals on June 14, and he asked me to go to Detroit with him. He and Mr. Mayo went, and he said he was interested. He said he had nothing to conceal about it. He said he wished I would spend some days with Mr. Mayo assisting Mr. Mayo with such information as we had collected through all these years.

I did that, and it required only until July 8, when he signed the offer, and this thing about his groping around sort of sticks in my craw. I called the Government's attention to the fact that he got this offer down here between June 6 and July 8, and the Government has been at Muscle Shoals working with it nearly 100 years. I do not refer to that same 100 years, either. That is how quickly he acted; and the offer has been coming to you for six or seven months. That is the history of it. I want to make it very clear to the committee that I am not a paid employee of Mr. Ford. I do not know that that information would be of any interest to the committee, but I want it understood.

He stated on the first day I was with him, on June 6, that he wanted to know what my relations to it were, and I explained them briefly. The next morning, June 7, Mr. Mayo said Mr. Ford was not satisfied with that statement. It became clear that they wanted to know what I was going to charge them, and I made it very clear that I did not have anything to sell; that this property belonged to the United States; and that I had not brought myself into the present situation or status, but civic organizations, farmers' organizations, etc., had done it, and I had no right to sell their influence. He could not buy it if he were to try. So I have merely furnished him such information as we had.

If the committee would like to see at any time what we have down there, or if any member of the committee is interested in that, we would be delighted to have you come down to our headquarters on Pennsylvania Avenue, and we will show you a motion picture of this plant from the time they broke the dirt until it turned out ammonium nitrate, and you can learn more there in 40 minutes than you can learn by reading books, because it is plain to the eye, and you can see the whole proposition. That is an answer in reference to my relations with Mr. Ford, is it?

The CHAIRMAN. Yes.

Mr. WORTHINGTON. That is what you wished?

The CHAIRMAN. Yes. What company are you connected with at the present time?

Mr. WORTHINGTON. None at all.

The CHAIRMAN. What company have you been engaged with?

Mr. WORTHINGTON. In the past I have been connected with the Sheffield Co., and I was president of the Muscle Shoals Hydroelectric Co. I was at one time vice president of the Alabama Power Co.

The CHAIRMAN. You were vice president of the Alabama Power Co.?

Mr. WORTHINGTON. Yes, sir; beginning in 1913.

The CHAIRMAN. That is the company that is mentioned in connection with the contract for the development of the nitrate plant No. 2?

Mr. WORTHINGTON. That is the same.

The CHAIRMAN. When did you cease your connection with that company?

Mr. WORTHINGTON. I think it was in October, 1915; I think it was in 1915—yes; it was in October, 1915.

The CHAIRMAN. That was before the United States got into the war?

Mr. WORTHINGTON. Oh, yes.

The CHAIRMAN. We were still at peace?

Mr. WORTHINGTON. Yes.

The CHAIRMAN. How did you come to break your connection with the company, or do you desire to go into that?

Mr. WORTHINGTON. That is a little bit embarrassing. I got fired.

The CHAIRMAN. Do you want to state the circumstances, or would you prefer not to do so?

Mr. WORTHINGTON. Oh, I do not know, Mr. Chairman. But if you ask it I will answer. It is not any pleasure to me to answer it.

The CHAIRMAN. I am sure the committee would like to know.

Mr. WORTHINGTON. At a meeting of the directors in New York—I was a director of the company—Mr. Mitchell, whose memory I cherish very much and who was one of three men in my State who are entitled to be regarded as of the first industrial magnitude—he is dead now—stated that he thought my activities about Muscle Shoals at Washington were not in harmony with the interests of the Alabama Power Co. I thought we had been some time approaching that statement, and I told him I thought he was right about it and that I ought to resign, and I left the company on account of my insistence that I could not be diverted from this Muscle Shoals proposition. The only reason in the world why I felt that way was this: All this Muscle Shoals talk can be narrowed down to one thing—capital. While perhaps it may now be true that the Alabama Power Co. or other companies would come forward and take it where you brought it, there are a good many reasons why people have been speeded up in the last few months. Before and since 1915 I have continued my interest. I started very foolishly to give my time and attention to it in 1901, and if you find anybody around here who wants to tackle anything of that kind, let them talk to me a little bit, and I will save them some trouble.

The work we have done has been done through the Tennessee River Improvement Association. It has been expensive work, but we never bought anything except facts; and Mr. Graham, when he was investigating the Muscle Shoals case, gave us a clear sheet. We have no apologies to make to anybody about what we have done.

The CHAIRMAN. While you were connected with the Alabama Power Co. this matter occurred of doing something for the Government and mixing it up so with the Government's affairs that, as one of the witnesses said the other day, "the eggs could not be unscrambled."

Mr. WORTHINGTON. You are talking about the Warrior River plant?

The CHAIRMAN. Yes.

Mr. WORTHINGTON. Whoever said that was rather mistaken about the situation. The Government did not build any egg plant down there. That is a steam electric station, and they do not lay eggs; they produce kilowatts; and you can unscramble kilowatts all right, if you try. There is a big station down here somewhere in Ohio—I can get the name of it if you want it—where there are two big companies, with the installation of one in one end of the station and the installation of the other in the other end of the station, and there is a property line running right through it. Such things as that, Mr. Chairman, remind me of a little story. A friend of mine in Alabama at one time told me he was taking a long walk one Sunday out in the country, and he came by a little Negro hut, with a little lot, and he looked over there, and there was a poor old horse, and the Negro was drenching him, pouring some mixture down the throat of the horse, which was sick. This gentleman walked along, and the Negro said to him, "Boss, is you a horse doctor?" My friend said, "No; I never doctored any horse." The Negro said, "I wish you would come over here and see if you could do something for my horse, because if I lose my horse I might lose my crop." So this gentleman went over and looked at the horse. It was a very poor horse, lean and bony. He said to the Negro, "Look here, old man, suppose you try a little corn." I suggest that in connection with the Warrior River plant we use a little common sense.

The CHAIRMAN. The point was made that the act of June 3, 1916, under which the Muscle Shoals plant was begun by the Government, contains an express provision that the Government alone should operate this plant, and should not make any agreement with any private corporation or company or individual that was inclined to make some contract with the Government. It was intended that the Government alone should do this work. But as the war progressed the officers of the Army found that in order to produce the nitrates very promptly it was advisable to make some arrangement with the Alabama Power Co. to get the use of their plant. So the arrangement was made—I think it was in 1918, or possibly toward the end of 1917—whereby our engineers did make an agreement with the Alabama Power Co.; and this committee has heard that

if we want to accept the Ford offer we shall have to do something to get rid of our contract with the Alabama Power Co. Have you given that any study at all?

Mr. WORTHINGTON. Oh, yes; I have, of course. I do not think I would like to discuss that. The committee will find its way out, I suppose. But these Alabama Power Co. people are from my State, and I do not want to get into any criticism. It is no time for people in Alabama to be fussing with each other. That is my idea about it, and I am not going to be a part of the fuss.

The CHAIRMAN. Mr. Quin, the other day, in speaking of that company said it was a foreign corporation, with its habitat in Canada, as I now recall. Do you know anything about that?

Mr. WORTHINGTON. I do not think the Alabama Power Co. is a foreign corporation; it is an Alabama company. But I think it is probably controlled by the Canadian company, or was; I do not know whether it is now or not. It was when I was associated with the company.

Mr. QUIN. Mr. Chairman, you did not get my question right. I said that the Alabama Power Co. is owned by the Alabama Traction, Light & Power Co. (Ltd.), which is a corporation of the Dominion of Canada.

Mr. WORTHINGTON. And I said, Mr. Quin, in answer to the question as to what that company was, that it was probably controlled by a foreign company, and that the foreign company was a Canadian company. But I think it is true that the Alabama Power Co. is an Alabama company, organized under the laws of Alabama. In 1915, I think, the situation was that the Alabama Power Co. was controlled by the Canadian company.

Mr. HULL. You spoke of the Warrior River plant. I suppose that is what is called the Gorgas plant?

Mr. WORTHINGTON. Yes, sir.

Mr. HULL. It is the same thing?

Mr. WORTHINGTON. Yes.

Mr. HULL. In the Ford contract we are to turn that over to Henry Ford, as I understand it. Is it your idea that the amount it costs us is to be amortized the same as the other expenses, or is the Government to pay for it and turn it over?

Mr. WORTHINGTON. Of course, it means that you would convey whatever property you convey to Mr. Ford free of any incumbrances.

Mr. HULL. I understand, but is the money to be charged into the river improvement, or is it to be turned over, the same as in the case of plant No. 2?

Mr. WORTHINGTON. Well, that is on all fours with plant No. 2 and the steam plant at No. 1, and the nitrate plant at No. 1.

Mr. HULL. What is hydroelectric power worth in Alabama; what are the rates?

Mr. WORTHINGTON. I do not know. The rates vary, and I have been away from the State for three years. I really do not know what the current rates are.

Mr. HULL. You say they are regulated by law?

Mr. WORTHINGTON. Yes; but I have not been down there recently.

Mr. HULL. Is that power worth \$20, or \$30, or \$50?

Mr. WORTHINGTON. I do not think there is any power sold, although there may be some, as low as \$20. There may be some secondary contracts that low. You can find that out from the Alabama Power Co.

Mr. HULL. We could find it out if we had the law of Alabama.

Mr. WORTHINGTON. I shall be glad to assist you in getting that.

Mr. HULL. Could you get that and put it in the record? I think it would be interesting to some of us who are trying to get at the actual facts in connection with this rather conflicting case.

Mr. WORTHINGTON. I will be glad to get any information I can and give it to you.

Alabama Power Co. rates for electric current at Huntsville, Ala., in effect Jan. 1, 1922.¹

Textile power rate (primary), not less than 100 kilowatts: ²	Cents per kilowatt hour.
First 35,000 kilowatt hours, per month.....	1.1
Next 35,000 kilowatt hours, per month.....	1.05
Next 30,000 kilowatt hours, per month.....	1
Next 100,000 kilowatt hours, per month.....	.9
All over 200,000 kilowatt hours, per month.....	.85

Wholesale primary power rate, not less than 100 kilowatts:

Demand charge ³	
Per kilowatt per month for first 100 kilowatts.....	\$1.50
Per kilowatt per month for next 4,900 kilowatts.....	1.25
Per kilowatt per month for all over 5,000 kilowatts.....	1.00

Energy charge—	Cents per kilowatt hour.
First 1,000 kilowatt hours, per month.....	3
Next 4,000 kilowatt hours, per month.....	2
Next 15,000 kilowatt hours, per month.....	1
Next 30,000 kilowatt hours, per month.....	.9
Next 50,000 kilowatt hours, per month.....	.8
Next 100,000 kilowatt hours, per month.....	.7
Next 100,000 kilowatt hours, per month.....	.6
All over 300,000 kilowatt hours, per month.....	.5

Retail power rate, not more than 100 kilowatts:

Demand charge per kilowatt, per month.....	\$1.50
--	--------

Energy charge—	Cents per kilowatt hour.
First 1,000 kilowatt hours, per month.....	3
Next 2,000 kilowatt hours, per month.....	2
Next 15,000 kilowatt hours, per month.....	1
Next 30,000 kilowatt hours, per month.....	.9

Retail lighting rate, minimum monthly charge per meter, \$1:

First 200 kilowatt hours, per month.....	10
Next 300 kilowatt hours, per month.....	7.5
Next 500 kilowatt hours, per month.....	5.5
All over 1,000 kilowatt hours, per month.....	5

Mr. HULL. There is one thing I am a little bit concerned about. In the first place, as I have stated before, it seems to me that plant No. 2 is the one important thing in this whole proposition, in keeping plant No. 2 in such condition so that we can use it at any time in case of war. That, to my mind, is the greatest object we have in making this contract, if we make it. But I am a little concerned about plant No. 1, known as the Haber process plant. If I understood correctly, it is the intention of Henry Ford to convert this plant from a plant for the utilization of the Haber process to an automobile plant. It seems to me that is rather questionable, in view of the fact that there will always be a demand for nitrates, and they say there is no doubt but that this plant No. 1 could be made into a successful plant and probably provide nitrates cheaper than the No. 2 plant. Have you anything you could suggest to the committee in regard to that?

Mr. WORTHINGTON. I could not speak technically on the subject to the extent that others whom you can bring before this committee can, but I will give you my opinion if you care for it.

Mr. HULL. I should like to have your opinion.

Mr. WORTHINGTON. In the first place, it seems to me that the committee can accept it as positively certain that Mr. Ford will never do it, because nobody who would want to be prudent would use that process in view of what happened in Germany a few months ago, where the Oppau plant blew up. That is one thing. Mr. Hull, I understood you to say you felt that perhaps nitrogen or fertilizer compounds could be produced at nitrate plant No. 1 cheaper than at plant No. 2?

¹ Bills in excess of minimum subject to 10 per cent discount if paid on or before 10th.

² Minimum annual charge \$18 per kilowatt of maximum integrated 15-minute load.

³ Based on maximum integrated 15 minute load.

Mr. HULL. I have understood so; I do not know.

Mr. WORTHINGTON. I think if you will see those who perhaps caused you to understand it that way and talk to them pretty closely you will find that perhaps you are mistaken, because it is rather singular that if that can be made a success, and admittedly it never has been—and that, I think, is known to the committee—it always did seem very strange to me that if it was a plant that would prove a great success, that the General Chemical Co. who designed it and who let the Government have the process, refused Mr. Glasgow's offer for it, to take the plant for three years, and that the United States would not charge a penny for its investment or the use of the plant, if only the General Chemical Co. would agree to spend \$500,000 in further development, investigation, research, and operation.

Mr. HULL. It is not true that it is not a success, because there is a plant at Syracuse, N. Y.—

Mr. WORTHINGTON (interposing). If you please, Mr. Hull, it stands to-day as a failure.

Mr. HULL. But the same process, if we have the correct information, is being used at Syracuse, N. Y., and is a success.

Mr. WORTHINGTON. But they have by-product hydrogen there, and the process is not the same. Nitrate plant No. 1 would have to be rebuilt. That plant at Syracuse is so located because of the coke-oven plant, I think. But I hope you will feel sure, Mr. Hull, that it would be impossible for Mr. Ford to consider—I would say for Mr. Ford as a duty to him, if you required it, that he had better ask you to let him withdraw this offer.

Mr. HULL. We are not saying what we believe; we are trying to get at the facts.

Mr. WORTHINGTON. And I am respectfully trying to state what they are, but on this side of the case.

Mr. HULL. Is there any reason why plant No. 1 should not be utilized in the manufacture of nitrates—

Mr. WORTHINGTON (interposing). There is this to be considered. Suppose it was a success and had proved to be a success. It would not be operated by Mr. Ford where it is. He would double it up with No. 2. We will assume, instead of your having the modified Haber process there (DeJohn's process), that both of your plants had been cyanamid plants as No. 2. Then Mr. Ford would not continue No. 1, because that would be in the face of expensive production as against economical production.

Mr. HULL. Of course, one of the objects of making this contract is the production of nitrates. That is one of those things that induces us to be in favor of something being done down there, and of course we want, if we can, to have it so that they will produce as much of the nitrate as is possible.

Mr. WORTHINGTON. While I had not intended to enter that field unless the committee required it. I will say this: Mr. Ford has absolutely convinced me that whatever is possible at nitrate plant No. 2 now, he will do; that whatever this new world of electrical soil food production will do, he will do it. It is a question that has not been solved. The fixation of nitrogen from the atmosphere is still at the threshold. But I was going to say that personally after all these years of association with it, and the last eight months' association with Mr. Ford and Mr. Mayo, I have no earthly doubt about it. There are a great many other things in this country that I doubt more than that.

Mr. HULL. You have no doubt but that they can produce nitrates at plant No. 2?

Mr. WORTHINGTON. I have no doubt in the world; they would not be confined to the present method entirely, however; oh, no.

Mr. HULL. Have you studied the question so that you could tell us how cheaply it can be done?

Mr. WORTHINGTON. I think only time can determine that. But I have long felt very sure that, as this committee was advised in 1916—and since then there has been repeated evidence of it—complete fertilizers can be produced at Muscle Shoals and sold at perhaps one-half, or, I feel sure, at one-third less than the farmers have been paying for it in normal times.

Mr. HULL. Not one-half or one-third less than they are paying at the present time?

Mr. WORTHINGTON. Than they paid before the war, in normal times. While I do not have it here, I would like to show the committee the report of an English commission which arrived at the same conclusion.

Mr. HULL. How long is that report?

Mr. WORTHINGTON. It is one of the most voluminous documents on the subject. There were 15 or 20 members of that commission, including engineers and scientists.

The CHAIRMAN. What is the name of the report?

Mr. WORTHINGTON. It is the report of the British Nitrogen Products Commission. We will bring you a copy so that you can see it. There are only a few copies of it in this country.

Mr. HULL. Your relations with the improvement of the Tennessee River at Muscle Shoals have brought you in some contact with the fertilizer people, have they not?

Mr. WORTHINGTON. Oh, yes; at times.

Mr. HULL. Have they encouraged you at all in trying to develop the Muscle Shoals proposition?

Mr. WORTHINGTON. All of the farmers' organizations, that I ever discussed the subject with, beginning in 1915, have, without exception, indorsed it. Some of them were reluctant and slow and others investigated it on their own account but without an exception they have indorsed it and we have cooperated with them. We have furnished them information just as we have furnished other people information—such as we have.

Mr. HULL. How about the manufacturers of the finished fertilizers; do they encourage you at all.

Mr. WORTHINGTON. Not unless they do it in my sleep.

Mr. HULL. Have they ever interviewed you?

Mr. WORTHINGTON. What was the question; have they ever interviewed me?

Mr. HULL. Yes; on this proposition?

Mr. WORTHINGTON. Yes; I have been interviewed but it would not add anything to your information to press me for an answer.

Mr. JAMES. Were you present in the Judge Advocate General's office when this proposition was being drawn up?

Mr. WORTHINGTON. No, sir; not all the time. The Judge Advocate General's office requested, in keeping with the Secretary of War's directions that they draft the offer in the legal form, that they get in touch with Mr. Ford's representatives, and they called me in and a few days later Mr. Mayo came here and conferred with them.

Mr. JAMES. Were you present there at the time?

Mr. WORTHINGTON. I was present when they sent for me.

Mr. JAMES. The Acting Judge Advocate General stated to the committee the other day that he understood the flowage rights were to be secured by the Government and to be paid for by Mr. Ford. What is your understanding of that?

Mr. WORTHINGTON. I have not seen Mr. Ford since he signed this final paper. I am advised, however, that he did not want to have anything to do with that. I will suggest, however, to this committee—and I do that on my own account and ask to be excused by Mr. Mayo—but speaking for myself, there is nothing in his proposition that he says he will not do it.

Mr. JAMES. In your conversations with Mr. Ford it was understood that nitrate plant No. 2 would be used for the production of nitrogen and other fertilizer compounds, was it not?

Mr. WORTHINGTON. All the time? Might I, if you will allow me, state this, that Mr. Ford, when he went to Muscle Shoals, never thought of nor did I suggest in our discussions on June 6 and 7 that he take the nitrate plants. But, when Mr. Ford and Mr. Mayo had examined them and spent a full day there on June 14, Mr. Ford said that nobody could ask the United States for that power without being willing to get under the fertilizer proposition and he repeatedly said he did not want to get into the nitrate business, but that the investment there was so great and when it had been explained to him how he possibly could contribute to the agricultural welfare of the country, he said: "Well, I will undertake it as a public service." And his proposition indicates that, I am sure.

Mr. JAMES. The compounds that are to be manufactured at nitrate plant No. 2 could be used for other purposes than in the manufacture of fertilizer, could they not?

Mr. WORTHINGTON. May I ask you to repeat that question?

Mr. JAMES. I say the compounds that are to be manufactured at nitrate plant No. 2 could be used for other things than the manufacture of the finished fertilizer?

Mr. WORTHINGTON. I do not exactly catch the meaning of your question. Do you refer to plant No. 2?

Mr. JAMES. Nitrate plant No. 2 and the provisions contained in article 14 of the Ford offer.

Mr. WORTHINGTON. So far as I know, it could not go into anything else. I can readily see how, with the possible changes that will be made there, depending upon the process adopted, you might have some results, you might get some compounds that would not be fertilizer compounds at all, but might be something else. But the primary product produced in volume would be fertilizer compounds. In coke making in retort ovens the primary product is coke—but they get ammonium sulphate as a by-product. Here the primary product sought is fertilizer. Congressman Bankhead says I did not quite understand your question, that the present possible production of fertilizer compounds, as I get it, you think might possibly be used for some other purpose?

Mr. JAMES. I asked you this question: Mr. Ford is going to manufacture nitrates and other fertilizer compounds at nitrate plant No. 2; does Mr. Ford intend to use that for fertilizer alone?

Mr. WORTHINGTON. That would be the primary purpose.

Mr. JAMES. Some of these things could be used for other purposes than the manufacture of fertilizer?

Mr. WORTHINGTON. Some of these things—do you mean some of the plants or some of the things produced?

Mr. JAMES. Some of the things he intends to produce. Paragraph 14 of the offer says:

"In the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period."

Mr. WORTHINGTON. That is, with some conditions and changes and processes that can be employed. There would be, for instance, phosphoric acid.

Mr. JAMES. There is nothing in this article which says that Mr. Ford shall use the entire production of nitrogen and other fertilizer compounds for the manufacture of fertilizer alone, is there?

Mr. WORTHINGTON. But you can not use those compounds you mentioned for any other purpose in that volume; you might in a very small way.

Mr. JAMES. Then there ought to be no objection on the part of Mr. Ford to stating in the offer that everything manufactured at nitrate plant No. 2 is to be used for the manufacture of fertilizer, and for no other purpose?

Mr. WORTHINGTON. It would be impossible, because there may be other processes in existence that will, in spite of anything or any intention on his part, make something else.

Mr. JAMES. I wish you would show me where there is any guaranty in this contract that the company Mr. Ford is to organize is to manufacture any particular amount of fertilizer. If it is not contained in paragraph 14, where is it?

Mr. WORTHINGTON. I have to acknowledge that if that is not clear, we can not make it clear.

Mr. JAMES. Do you think Mr. Ford would have any objection to stating that products of that kind would be used for fertilizer alone?

Mr. WORTHINGTON. I think he would be absolutely prohibited from stating it; he could not comply with any such terms.

Mr. JAMES. How many tons of fertilizer do you suppose Mr. Ford would agree to guarantee per annum?

Mr. WORTHINGTON. The equivalent of 110,000 tons of ammonium nitrate, as he says.

Mr. JAMES. How many tons of fertilizer do you figure that would make?

Mr. WORTHINGTON. With a mixture which is very common, 2-8-2, it would be about 2,000,000 tons.

Mr. JAMES. Do you think Mr. Ford would guarantee to produce a minimum of 2,000,000 tons of fertilizer?

Mr. WORTHINGTON. That answer which I made is the interpretation of section 14 of the contract.

Mr. JAMES. If that is the correct interpretation, why not put it in the agreement.

Mr. WORTHINGTON. You take the question of the production of fertilizer at nitrate plant No. 2 and the possible processes to increase the percentage of the soil food in the compounds that would be used to compose a complete fertilizer, and as the quality goes up the tonnage required would be less. As I do not seem to get along very well in straightening this thing out, I would suggest that you let Mr. Waldo try his hand at it.

Mr. JAMES. Mr. Ford intends to guarantee a certain amount of fertilizer?

Mr. WORTHINGTON. It is stated here.

Mr. JAMES. What is the number of tons—you say it would be 2,000,000?

Mr. WORTHINGTON. This would be expressed in its production of ammonium nitrate. It would be 38,500 tons of nitrogen. That can be put in another form. I take the liberty, without consulting Mr. Mayo—of course, he is speaking for Mr. Ford—I take the liberty of saying that this plant will not be confined to nitrogen compounds alone, but with those phosphates and other deposits there within 40 miles. Of course, I think in the course of your hearing you will understand that with perfect clarity.

Mr. JAMES. Evidently you do not want to answer the question.

Mr. WORTHINGTON. Congressman, I assure you I do. I may have failed to do it, but I do really want to answer your question.

Mr. JAMES. You intended to answer it until Mr. Mayo whispered to you.

Mr. WORTHINGTON. That is very unjust to Mr. Mayo and unjust to me. I positively assure you, upon my word of honor, that he did not color my reply at all. I want you to know I am of a friendly disposition and with friendly intentions, and I want to try to answer your questions. I might have failed, but it is very difficult to answer what you are asking, I assure you, because it involves so much.

Mr. JAMES. I am in favor of the proposition, but it appears to me some of the witnesses are holding back some of the information they really know.

Mr. WORTHINGTON. I am not holding back anything, I can state to you. I am sure I can say with a good deal of confidence that it is true that I never held any information back on this subject that I ever had, because it would do me no good in the world to do it. I have not any interest in it. I am very frank to tell you all I know about it and also that I have a lot to learn about the chemistry of fertilizer production. The more I study it the less I think I know about it.

(Thereupon, the committee took a recess until 2 o'clock.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

STATEMENT OF MR. J. W. WORTHINGTON—Resumed.

The CHAIRMAN. Mr. Worthington, Mr. James, I believe, would like to ask you some further questions.

Mr. JAMES. Pursuant to our conversation this morning, will you put in the record to-morrow the total number of tons of fertilizer you figure will be made?

Mr. WORTHINGTON. I will be glad to prepare a very full statement in regard to that.

Mr. JAMES. Showing the number of tons of fertilizer Mr. Ford agrees to make under the proposition.

Mr. WORTHINGTON. Yes.

NOTE.—Mr. Ford agrees in his offer “to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other commercial fertilizers (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period,” etc.

He therefore agrees to make nitrogen commercial fertilizers and other kinds of commercial fertilizers requiring for their nitrogen content an amount of nitrogen equal to the amount of nitrogen contained in 110,000 tons of ammonium nitrate.

Since ammonium nitrate is 35 per cent nitrogen, 110,000 tons of ammonium nitrate contains 38,500 tons of nitrogen. This is sufficient nitrogen to make—

	Tons.
Ammonium sulphate (24 per cent nitrogen)-----	100,000
Sodium (Chilean) nitrate (16 per cent nitrogen)-----	240,000
2-8-2 commercial fertilizer (2 per cent nitrogen)-----	1,925,000

It should not be understood, however, that Mr. Ford intends to make any of these, for it is his expressed purpose to produce a more concentrated plant food than any of the above forms.

Mr. MILLER. Mr. Worthington, we all were interested in your very thorough analysis of the desirability of water power, and among with it it really seems a shame that this great water energy has come to waste for so many years while the world has been industriously working out the supply of fuel in the shape of coal. I may say, Mr. Worthington, that some of my colleagues on the committee and some of my friends in the House agree that we are now engaged in these hearings for the purpose of determining a way of salvaging this war necessity at Muscle Shoals. I may say for my part that I disagree with many of my colleagues.

We are not engaged in undertaking to salvage a war necessity, because this was one of the enterprises of the American Government initiated before we were in any war, and was initiated simply and solely for the purpose of what we might call the preference of this Government, and this is one of the enterprises, and perhaps the only one that never was intended to be salvaged. It was to be one of the standing, permanent adjuncts of the War Department, and was not to cease, and never was a war emergency; but the legislation that created this enterprise at Muscle Shoals was of a hybrid character, the production of ammonium nitrate for war purposes in time of war and in time of necessity, and during times of peace the production of some substance that could be used to advantage in times of peace, and it never was intended as a war measure.

Now, you are very familiar with the electric power contained in the Tennessee River. You have made that a special study, as I understand it, Mr. Worthington.

Mr. WORTHINGTON. Somewhat.

Mr. MILLER. And, notwithstanding the great advantages of water power over steam power, there has been, up to this good hour, no private company that has been willing to take hold of the Muscle Shoals proposition and develop it with the purpose in view of generating hydroelectric power; that is a fact, is it not?

Mr. WORTHINGTON. Except Mr. Ford's offer.

Mr. MILLER. I say up to this hour there has been no person willing to take it over before this tentative offer of Mr. Ford. All the years before the Government went down there in 1916, no private company in the world was willing to embark upon the enterprise of developing the hydroelectric energy at Muscle Shoals?

Mr. WORTHINGTON. Oh, yes; there was a company. The Alabama Power Co. was quite willing and made an offer on it to the United States.

Mr. MILLER. How long has the Alabama Power Co. been in the business of producing hydro-electric power in northern Alabama.

Mr. WORTHINGTON. It has not been in that business in northern Alabama at all, but the Alabama Power Co. owned the dam site upon which and at which you have built Dam No. 2.

Mr. MILLER. Well, it never did anything to develop power there, did it?

Mr. WORTHINGTON. Nothing except to make the most exhaustive studies of it and made a proposition to the United States which the United States engineers recommended to Congress that it accept, but it never got any further than the Rivers and Harbors Committee. It never was reported at all.

Mr. MILLER. Well, there are a large number of those cases throughout the United States where companies survey the possibilities of water power but never do anything.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And there are a multitude of applications down here on file now. The trouble seems to be, Mr. Worthington, the reluctance of the financial world to invest in hydro-electric plants. In other words, a financial institution may lend \$20,000,000 on an industrial plant that is engaged in the production, say, of farm machinery, and their security may become jeopardized and they may have to take it over, because the production of farm machinery has been at a loss, but that plant can be converted for the production of some other necessity that may be a financial success, whereas if you put your money into a hydro-electric plant, you are limited to one output, and you can never convert it into anything else. We are experiencing in this country and have been from the beginning of the development of our hydro-electric plants what you might call the hesitation of financial people to invest enormous sums of money in them, and this particular development at Muscle Shoals is one that takes an enormous amount of capital.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And probably that accounts for its not having been developed some years ago.

Mr. WORTHINGTON. It does.

Mr. MILLER. Your remarks this morning were very interesting and I am pleased with them, Mr. Worthington, because I come from a water power State.

Mr. WORTHINGTON. You certainly do.

Mr. MILLER. A State that probably has more water power than any State in the Union per square mile, and roughly estimated at one-seventh of the undeveloped water power.

Mr. WORTHINGTON. One hundred and twenty-five horsepower per square mile.

Mr. MILLER. The great factor in that is the Columbia River of our country, probably only exceeded by Muscle Shoals or rather, we are the only one that exceeds Muscle Shoals in potential energy. The water power development is what will mean increased activity and produce the substantial things of value connected with the Ford enterprise, and it is the water power end of it that constitutes the major value of the enterprise.

Mr. WORTHINGTON. I do not know that I exactly grasp or comprehend your question, but that is primary to everything that is to happen there that Mr. Ford can do.

Mr. MILLER. You related to the committee this morning that in one of your interviews with Mr. Ford, if not the first one of your interviews, you mentioned the production of fertilizer, about which he hesitated at first and then afterwards agreed to take up that angle of it.

Mr. WORTHINGTON. Yes, sir.

Mr. MILLER. So, then, it must have been the water power—

Mr. WORTHINGTON (Interposing). Oh, certainly. He went to Muscle Shoals to see the water power primarily.

Mr. MILLER. That is what I have been trying to satisfy myself about in my own mind.

Mr. WORTHINGTON. You may be satisfied of that, because he would not have gone there to look at the nitrate plants.

Mr. MILLER. No; or anyone else.

Mr. WORTHINGTON. That is right.

Mr. MILLER. Nobody in the world would go there to look at the nitrate plant. It is the water power that is of value.

Mr. WORTHINGTON. Yes; but he would be interested in the nitrate plant after he saw the water power.

Mr. MILLER. Oh, yes; but, after all, it only takes in the vicinity of 100,000 horsepower to drive nitrate plant No. 2 to its full capacity.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And we are developing, according to Mr. Ford's proposition here, nearly 1,000,000 horsepower, of which 850,000 is to be hydroelectric, 110,000 of it, approximately, steam power, and out of the 850,000 hydraulic power some 230,000 of it will be primary power.

Mr. WORTHINGTON. With the steam power included.

Mr. MILLER. Yes; with the steam plant of approximately 110,000 horsepower. Now, taking in view the proposition that this nitrate enterprise at Muscle Shoals was designed and constructed as a permanent proposition; that it was never intended to be salvaged and sold and disposed of by the United States, and at best that it was intended to be kept in a stand by condition for the purpose of producing this war necessity and the production of other things in time of peace. Now, according to Mr. Ford's offer we are parting with that which we never intended to part with. That is the basis of it. We are to part with our title to these two vast nitrate plants which the Government has always intended it should cling to; but, in return for that, while we do part with them, Mr. Ford's proposition is that during the lifetime of his lease this plant shall be kept intact, available to the Government for the very purpose it was constructed for. So that as I look at it, it amounts to little in whom the title may be vested. What we are after is the stand by of that great plant, which we can take advantage of in case of necessity.

Mr. WORTHINGTON. Yes.

Mr. MILLER. Now, there is another angle to that, and that is if the Government remains the owner of this property and the title in fee continues in the Government, in case of an emergency the Government would be using its own property, whereas with a lease we would be using another man's property and

be paying correspondingly for it. That is the way I view it, and that is your analysis of the situation, is it not?

Mr. WORTHINGTON. I think you have analyzed it, but do you not think, Mr. Miller, you have omitted there to include in your statement the important fact that he does maintain it and keep it ready, whereas, if I understand you, if the Government should keep it it would only continue it idle, maintain and watch it, and keep it ready. Do I catch that as your point?

Mr. MILLER. No; I do not think we quite meet.

Mr. WORTHINGTON. I was not sure on that point.

Mr. MILLER. The purpose of the legislation by which this enterprise was first started, under the national defense act and the initial appropriation of \$20,000,000, the Congress had just as much in view in the industrial future of this plant as it had the military future of it. So that it is of that particular character, the two utilities blended, and I might say that the way the Military Affairs Committee has jurisdiction of this hearing is because we are dealing with a piece of property that was constructed under the national defense act and has always been operated by the War Department.

Mr. WORTHINGTON. Yes.

Mr. MILLER. Let me ask you, Mr. Worthington—I have never been at Muscle Shoals, much to my regret.

Mr. WORTHINGTON. I hope you will come, and I invite you to come there.

Mr. MILLER. Thank you, very kindly. What facilities are there now at Muscle Shoals in aid of navigation?

Mr. WORTHINGTON. Well, really, none.

Mr. MILLER. No steamers drawing any draft of water—

Mr. WORTHINGTON (interposing). No; not at all. This dam has progressed in its construction to the point that the navigation that we had had previous to this dam's partial construction has been cut off.

Mr. MILLER. It is a complete barrier to present navigation?

Mr. WORTHINGTON. It is to-day.

Mr. MILLER. Now, before this dam was constructed—

Mr. WORTHINGTON (interposing). We have a canal beginning at Lock 9, so called, 3 miles up the river from this dam, and that portion of the stream between Dam No. 2 and Lock 9 of this canal is a shoaly, unimproved stretch of the river and can be used by boats only in the wet season; that is to say, sometimes three or four or more months in the year, and almost always for a month or two you could not have any river traffic over it. This canal, therefore, was really isolated. It has nine locks on the north bank of the river and two locks on the south bank, but between the eastern end of the locks on the north bank and the western end of the locks on the south bank is another very shoaly and unimproved stretch.

I may say to you that a practical answer is that the navigation was unreliable, expensive, and that as it stood the cost of those locks and that canal, Mr. Miller, was an absolute waste. There is no denying it.

The CHAIRMAN. This morning you stated to the committee that if the members desired to see a moving picture of Muscle Shoals we could go to some place down here on Pennsylvania Avenue.

Mr. WORTHINGTON. Yes; just two blocks away.

The CHAIRMAN. We have here in this building the caucus room, which is quite large and which has its own machine.

Mr. WORTHINGTON. Then, we will bring the films and exhibit them to you at any hour that you select.

The CHAIRMAN. I was going to ask if there would be any objection to having this committee and such other Members of the House as may desire to be present see the whole thing?

Mr. WORTHINGTON. Absolutely none. We shall be glad to exhibit them at any time you may select.

Mr. MILLER. How far is the Tennessee River navigable upstream from Muscle Shoals?

Mr. WORTHINGTON. The navigation stretches are interrupted by nonnavigable stretches. After you get to Decatur, Ala.—

Mr. MILLER (interposing). How many miles is that from Muscle Shoals?

Mr. WORTHINGTON. That is about 35 miles from the canal; that is, from Lock A, which is located at the upstream or eastern end of the canal. Then, if I may continue, please, there is a stretch of the river that is navigable nearly all the year around, but at very low stages the navigation is interrupted. After

you get upstream farther east or northeast there is a stretch of some 40 or 50 miles that needs improvement. There is an improvement now authorized on which work is suspended at the present time on account of funds, which improvement is being made southwest of Hales Bar, and Hales Bar is the power-navigation dam that is 27 miles, I believe, south of Chattanooga. That was built by private interests under a 99-year grant by Congress. That is a slack-water pool, providing about 33 to 35 miles of very perfect navigation, of course, and then after that the navigation is interrupted very frequently. I would like to ask you, if you can possibly find the time, to come and look at these maps, which answer better than I can possibly put into words, the questions you ask about the navigation.

Mr. MILLER. That would be very desirable and is very kind of you.

Mr. WORTHINGTON. It would give a complete answer, and you will find some very interesting facts about it; and you will also find there has been a great deal of money wasted. I do not criticize anybody. I am just stating the facts.

Mr. MILLER. We can not get maps into the hearings, however.

Mr. WORTHINGTON. It is a pity you can not.

The CHAIRMAN. The chairman will ask the Speaker of the House to allow those maps to be put into the hearings. The Speaker can authorize that, and I will take the first opportunity to present that matter to him.

Mr. WORTHINGTON. I am going to ask you, Mr. Miller, to go around some evening with me and take a brief look at them. It will not take you more than 30 minutes.

Mr. MILLER. Now, the distance following the river channel upstream from Muscle Shoals to Chattanooga is approximately how many miles?

Mr. WORTHINGTON. About 188 or 190 miles.

Mr. MILLER. Following down the stream from Muscle Shoals to the mouth of the Tennessee, where it flows into the Ohio—

Mr. WORTHINGTON. Two hundred and fifty-nine miles.

Mr. MILLER. Then, you are approximately in the middle, between Chattanooga and the mouth of the river.

Mr. WORTHINGTON. Yes; and you have hit the nail on the head about the whole thing. During all these years the trouble was that this very serious obstruction at Muscle Shoals of some 37 miles blocked the navigation and prevented—well, really, it was practically impossible for traffic from the upper river to get through.

Mr. MILLER. It was blocked in the middle of that stretch.

Mr. WORTHINGTON. Yes, sir; that was exactly the situation, and it was the expense, as you have suggested, at Muscle Shoals that made it look for a long time utterly impossible.

Mr. MILLER. Are there any obstructions down the river.

Mr. WORTHINGTON. The navigation improvement of the Tennessee River from the foot of Muscle Shoals, and practically at this dam, is completed to the Ohio River at Paducah.

Mr. MILLER. How far is it from the confluence of the Ohio and the Tennessee?

Mr. WORTHINGTON. Forty miles to the Mississippi.

Mr. MILLER. Then in the event this enterprise goes through, you have an unobstructed channel by water from Muscle Shoals to the very heart of the country.

Mr. WORTHINGTON. That is exactly it.

Mr. MILLER. You can go up the Ohio and up the Mississippi—

Mr. WORTHINGTON. Yes, and down the Mississippi to New Orleans.

Mr. MILLER. Yes; down to New Orleans and down and up the Missouri River.

Mr. WORTHINGTON. Exactly.

Mr. MILLER. And then you will be connected with the very heart of the country which, of course, is the Mississippi Basin.

Mr. WORTHINGTON. Yes, sir.

Mr. MILLER. You have, of course, examined the offer of Mr. Ford, and if I understood you in answer to Mr. James, you stated that you were present part of the time when it was being drafted in the Judge Advocate General's office?

Mr. WORTHINGTON. Yes, sir.

Mr. MILLER. I suppose that was on account of your interest to get something established in the valley of the Tennessee River; that was your primary purpose?

Mr. WORTHINGTON. That, and my agreement with Mr. Ford that I would continue, since he signed this, to furnish such information and assistance as I could.

Mr. MILLER. And the assistance you have rendered is wholly in a disinterested way?

Mr. WORTHINGTON. Absolutely; almost to the point of being foolish.

Mr. MILLER. And up to the present time Mr. Ford is the only man in the country of sufficient enterprise and wealth to make any coherent proposition to the Government for this enormous expenditure we have made.

Mr. WORTHINGTON. Let me answer that, if I may be permitted to, in this way: He is the only man that has done so.

Mr. MILLER. Of course, in this agreement the identity of Mr. Ford is destroyed, his personal identity with this concern, because the second paragraph of the provision provides that he creates or organizes a company and thereby the personal relation of Mr. Ford to the Government will be nil, and the arrangements and the intercourse will all be between a corporation and the United States Government. That is to be the future, as marked out by this offer of Mr. Ford, except Mr. Ford agrees and covenants to control the corporation.

Mr. WORTHINGTON. Yes; I was just going to say that I feel very confident he will absolutely control and dominate it as long as he lives. Of course, I could not say beyond that point, but the proposal as signed by him binds his estate.

Mr. MILLER. Of course, we do not look upon that as any serious factor in the matter, because under the law of the State of Michigan, in common with the law of nearly ever State of the Union, any claim against an estate has to be filed within one year after the death of the party.

Mr. WORTHINGTON. That is true; but, Mr. Miller, I do not believe you will ever get Muscle Shoals developed unless there is some confidence in somebody.

Mr. MILLER. No one disputes that, Mr. Worthington, and I believe that every member of this committee is looking for something in the way of this offer.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And while some of us may probably on the spur of the moment appear hostile to this enterprise, we are searching for the relations between the Government and this company and where the Government is coming out financially on this enterprise.

Mr. WORTHINGTON. Yes.

Mr. MILLER. Is there a public-service commission in the State of Alabama?

Mr. WORTHINGTON. Oh, yes.

Mr. MILLER. That puts the price upon electric energy?

Mr. WORTHINGTON. Oh, yes.

Mr. MILLER. It controls the prices?

Mr. WORTHINGTON. Yes; they fix prices.

Mr. MILLER. We are dealing, then, with one of those institutions where the Government owns the origin of power, the raw product.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And the State controls the output and the price of it.

Mr. WORTHINGTON. Yes.

Mr. MILLER. We are dealing with that kind of an enterprise.

Mr. WORTHINGTON. Yes.

Mr. MILLER. The probable future of this thing, should this offer be accepted, will be of inestimable value to the people of that locality and surrounding territory for hundreds of miles, in two particular channels, one of which is the industrial development of the community and the second is the navigation of the Tennessee River.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And it is from those two angles that the people of that entire geographical locality are intensely interested in the future of Muscle Shoals.

Mr. WORTHINGTON. Yes; and I hope you would be willing to add the electrification or the improvement of rail transportation.

Mr. MILLER. Oh, yes; I would include that as a part of the industrial end of it.

Mr. WORTHINGTON. Yes.

Mr. MILLER. Now, according to this offer, Mr. Worthington, a sum of money variously estimated is required to complete these two dams. I believe that is estimated by Mr. Mayo at \$42,230,000; is that correct?

Mr. WORTHINGTON. I did not have the opportunity to hear Mr. Mayo testify.

Mr. MILLER. I think that was the sum, was it not, Mr. Mayo?

Mr. MAYO. That is right.

Mr. MILLER. The Engineers place it at \$50,000,000. Now, probably, there are only two ways of raising that money; one is by increasing taxes through-

out the country, and the other is by a bond issue, by which the interest that Mr. Ford would pay and agrees to pay under his contract would be sufficient to meet the expenses of the Government to pay the interest on the bonds, provided, of course, that the Government can negotiate the bonds at par at 4 per cent. That is the limit of Mr. Ford's offer in all this thing—4 per cent. Now, practically, I dare say, in your search for improvements of the Tennessee River and the installation of industrial concerns there, utilizing the splendid water power of the Tennessee River, you have been unable to attract 4 per cent money to these enterprises.

Mr. WORTHINGTON. That is quite true; you could not do that.

Mr. MILLER. Then, it is quite clear that the excess between what these bonds can be sold for and the 4 per cent Mr. Ford pays will have to be met out of the public Treasury; and I think you will also agree with me that the net proposition of Mr. Ford is that the Government will finance this proposition at 4 per cent. That is the proposition, is it not?

Mr. WORTHINGTON. Yes.

Mr. MILLER. In other words, the Government is lending its credit to Mr. Ford, which credit is not to exceed 4 per cent.

Mr. WORTHINGTON. Yes; but the Government, if we accept the statement—and I am prepared to accept it if you wish as you have just announced it—but the Government itself, however, is financing its own property.

Mr. MILLER. That is quite true, Mr. Worthington.

Mr. WORTHINGTON. And it is doing no more, if I may be permitted to call the attention of the committee to the facts, it is doing no more than it is doing on other rivers. It is doing that on the Ohio, which I think it ought to do, only it does not do enough and does not improve the navigation enough. In this particular case I hope you will remember that you get on your investment 4 per cent and that you get the return of the principal at the end of the lease period, whereas on the Ohio River—and let me, if I may, impress the committee with this fact—you never do get a single cent's interest and you never do get a single penny of the principal returned; and I may go further. Out in your State—I do not know for how many projects nor to what extent the capital has been invested—but I think you have in your own State some of the irrigation projects of the country. I think in that policy everybody agrees to the wisdom of it, but it is a fact, also—and drawing a friendly contrast—the investment stands to-day at a net total, in your Reclamation Service, of \$125,870,830, which you invest to make arid lands productive. Now, you do not get a penny's interest, and you get the principal returned very slowly; and I must ask you to let me hold to one thing, that in respect to the reclamation policy of this Government, there is no difference in policy at Muscle Shoals, because while you to-day may not have the confidence and feeling of certainty that others have and that I have, in time you will see demonstrated there that you can do as much with water for agriculture east of the Mississippi as you can do with water for agriculture in the State of Washington and in other reclamation States.

Mr. MILLER. Except you do it through a different medium.

Mr. WORTHINGTON. Exactly. In one case, you use the water to get the fertilizer and carry it to the land, but out there you put the water on the land.

Mr. MILLER. I am aware, Mr. Worthington, that the Government lends money to the reclamation fund without any interest.

Mr. WORTHINGTON. Yes.

Mr. MILLER. And the fund is amortized through a certain system that they work out. Now, under Mr. Ford's offer, there is also a plan of amortization.

Mr. WORTHINGTON. Yes.

Mr. MILLER. He pays semiannually \$19,868 on Dam No. 2, and semiannually \$3,506 on Dam No. 3, which amounts to something like \$47,000 a year.

Mr. WORTHINGTON. \$46,746.

Mr. MILLER. And that is put in there for the purpose of amortizing the cost of those dams, and it is figured that it will amortize them if placed at interest compounded semiannually at 4 per cent.

Mr. WORTHINGTON. The offer does not mention the rate, but 4 per cent, if secured, Mr. Miller, will do it.

Mr. MILLER. If that sum of money with payments semiannually in those amounts can be put at interest at 4 per cent compounded semi-annually, the figures are, I believe, that it would amount to something like \$49,000,000 at the expiration of this leasehold interest.

Mr. WORTHINGTON. That is right.

Mr. MILLER. And, of course, that would be a very difficult thing, practically, to do. In the first place, we are confronted with the same proposition that financial institutions were in financing this thing. It is not attractive for that kind of investment. 'I know of no concern in the United States of sufficient stability where this fund could be deposited for 100 years that would take any deposit on any such terms as that.

Mr. WORTHINGTON. Of course, I am not prepared to resist your fear, but I do feel that in view of your very large investment down there, whether fortunately or unfortunately made, it is made, and I do feel there ought to be some way for the Federal Reserve Board to take care of this, and I believe if you provided for it, that they can and will.

Mr. MILLER. In other words, it is a financial enterprise that no one but the Government could be the banker in.

Mr. WORTHINGTON. Now, if I may, I would like to right now settle one thing. Muscle Shoals has always been, is now, and always will be too big for any private enterprise. We might just as well face the facts. They are not new.

Mr. MILLER. That is the reason I say that no enterprise has gone in there that was willing to take it.

Mr. WORTHINGTON. Yes; and, moreover, long ago I came to the conclusion that they did not have any business there.

Mr. MILLER. Now, here is what the Ford offer gets down to. Financing it with 4 per cent money, which no private enterprise could do, paying it back in an amortization fund, compounding it semiannually at 4 per cent, which no private enterprise could do. Now, there is the Government's angle to this thing, so far as the dams are concerned. Coupled with that is Mr. Ford's purchasing the fee of an investment of between \$105,000,000 and \$106,000,000 less \$17,000,000, that has gone into the dam, or approximately eighty-eight or ninety million dollars.

Mr. WORTHINGTON. Yes; though I do not agree that it is impossible for a private concern to invest money at 4 per cent, compounded semiannually. Thousands of banks do that for their savings depositors every year.

Mr. MILLER. In an enterprise that the Government never intended to part with, and Mr. Ford is buying it at 4 cents on the dollar, or at practically 4 cents on the dollar.

Mr. WORTHINGTON. Well, may I suggest that the intention, I think, is not the controlling point. What you intended or did not intend during the war was never thought of. It is a fact, whatever your intention was, that you built the biggest smokeless-powder plant on the face of the earth and you sold it out for 3 cents on the dollar; and, moreover, you parted title and it is gone, and you will not find it there as Mr. Ford offers to let you find the nitrate plant if you ever get into trouble; and I can go down the line with the sales of your wooden ships and if I might wish to I could bring a sad story here about cantonnements, and they are all gone; and while I expect Mr. Ford will give me a rap over the knuckles for defending this thing because he does not want it done in that way, at the same time I can not remain silent when there are such horrible examples that offset this horrible example you set up at Muscle Shoals.

Mr. MILLER. Your analogy, Mr. Worthington, is something I do not intend to get into an argument about, as to the enterprise at Nitro, W. Va., or any of the others, but this is a distinct enterprise that did not grow out of the war.

Mr. WORTHINGTON. That is true.

Mr. MILLER. Keep that plainly in mind, Mr. Worthington.

Mr. WORTHINGTON. That is true; I grant it.

Mr. MILLER. The Government embarked upon this enterprise before we had any war.

Mr. WORTHINGTON. Yes.

Mr. MILLER. Possibly with a war imminent, which some people refused to heed, but the Congress scented what was in the future before we entered into the war—embarked on this one enterprise for nitrate preparedness, so you can not place it alongside one of those enterprises which was a direct outgrowth of the war and which we constructed after we got into the war. This was something that was provided for prior to the war, and the whole philosophy of the legislation was in the absence of war between this country and any other country in the world; and therefore I say it was one of the enterprises and the only one, I dare say, that the Government embarked upon as a permanent enterprise that would endure throughout the future. Now, we are taking that plant, so constructed, and instead of following out the legislation as it was intended, that that should be a permanent proposition for the manufacture of munitions

to be used in case of war and the manufacture of substances useful in times of peace, like fertilizer, the proposition now pending before us is that we shall part with it.

Mr. WORTHINGTON. Well, you will, I am sure, be indulgent enough with me to grant that the only thing left for me to say respectfully to you is that that is what you have got before you in the Ford offer for your respectful decision.

Mr. MILLER. Yes. Then the proposition pending before us is exactly the antithesis of what the Congress intended in establishing this plant. They intended it should be a permanent enterprise. Now, the proposition of Mr. Ford is to buy it and the Government is to part title with it at 4 cents on the dollar.

Mr. WORTHINGTON. Well, I can not help, Mr. Miller, from asking you, I just can not help it, if you do not intend to do it by means of this antithesis or some other "ant-way," what are you going to do with it? If the Ford offer does not solve it and is not acceptable, you will pardon a poor fellow who has been in this Muscle Shoals game for about 15 or 16 or 20 years for being interested enough to inquire, what are you going to do with it?

Mr. MILLER. That is exactly what I want to suggest to you. The purpose of this legislation was that the Muscle Shoals proposition would be good for two purposes, one in time of war and one in time of peace, and now we are investigating what shall be done with it in time of peace, and we have before us the concrete offer of Mr. Ford who, up to this good hour, is the only gentlemen of sufficient enterprise and wealth to make a concrete proposition.

Mr. WORTHINGTON. Which offer makes it permanent for 100 years.

Mr. MILLER. Now, there may be this angle to it: That before the expiration of this leasehold interest of 100 years, industrial chemistry, applied chemistry, or economic chemistry and its relation to economics, may discover an entirely new method of generating ammonium nitrate, as you suggested this morning, but the cyanamid process, together with the Haber method, are the two best ways of producing it in sight now, outside of the coke-oven method.

Mr. WORTHINGTON. I believe there are witnesses to follow me who, as far as the field of commercial chemistry is concerned, could be more instructive than I can. However, I want to grant one suggestion that I understand you make, that the great possibilities of the future, say, in just the one field of soil foods produced by electric-furnace methods, are so inviting and promise so much that I do not think anybody in the world can tell now what will happen; but I do not think that because we can not tell we should not try to find out.

Mr. MILLER. It would be the very goal of shortsightedness not to try to find out these things and to keep abreast of the world.

Mr. WORTHINGTON. Yes; and without speaking to the committee with excessive partiality for Mr. Ford, I must ask you to remember that he is the only one that has had the courage to say he would try to do it.

Mr. MILLER. There is embodied, then, in this proposition, several elements, all of which are of value, enormous value, some directly flowing to the Government, others flowing to your State; some indirectly to your State and some indirectly to the Government. We have the retention of this Nitrate Plant No. 2, available throughout the leasehold interest for the very purpose for which it was constructed, the manufacture of nitrate for war purposes.

Mr. WORTHINGTON. Yes.

Mr. MILLER. We have, second, in times of peace, the availability of that enterprise for the manufacture of commercial fertilizers, another one of the purposes for which the plant was constructed. Therefore, we have complied with the legislative intent in those two particulars fully. We have following that a large surplus of hydroelectric energy for distribution throughout the South generally, or at least throughout that zone of the South surrounding Muscle Shoals, which we are told is impregnated with large mineral deposits, and only awaits the hand of man and economical power. We have another element, the navigation of the Tennessee River, which is clearly distinct from the province of our committee to inquire into, that coming before another committee of the Congress. We have, then, by the installation of large commercial enterprises in the South, the upbuilding of that community which will be reflected throughout every corner of it, and a Nation to be great must be great in all of its parts, leading thereby to increased taxable wealth of your State and the surrounding States where this enterprise will be reflected; but one of the obstacles to my mind is how the Government is coming out on this financially, and, in the second place, we are doing something in disposing of this property that Congress never intended we should do, because it was the congressional intent that that property should remain an abiding part of our

national preparedness from the nitrate point of view. Now, we may be getting indirectly all that we would accomplish by directly holding the plant, and that may be overcome in some measure by the better manipulation of the plant and by putting it to more useful purposes in times of peace, which this enterprise contemplates.

Mr. WORTHINGTON. I would like to be permitted to add this much to what you have said, and that is, that one of the most valuable considerations about the Ford offer, unless you can get a better one, is that that plant will keep pace with the art, not only of air-nitrogen fixation but it will keep pace with the whole field of opportunity to improve agriculture through electrochemistry.

Mr. MILLER. Now, you have opened up a suggestion there that I want to ask you a question about. It matters not to your people or to your concern; that is, the Tennessee River Improvement Association, or whatever its name is, whose money goes into this thing, whether it is Mr. Ford's or anybody's else, so long as you get results.

Mr. WORTHINGTON. Oh, but that is true in one sense, and then there is another sense, if you please, that I can not agree with you. We are interested, and in this way: As far as we know there is nobody that has the intention and the money at the same time to do what Mr. Ford says he will do. Nobody has ever suggested to the Tennessee River Improvement Association, as far as I am advised, that he intends, if he can get there, to make aluminum and other light metals, electric steel, perhaps, and other various things that take immense capital; and more important than all that to the Tennessee River Improvement Association, nobody has ever intimated that with his own money and at his own expense he would build dams on the upper Tennessee and its tributaries. So, please, let us draw a very marked distinction between Mr. Ford and his money and intentions and other possible interested parties.

Mr. MILLER. Now, Mr. Worthington, just a moment on that line. Here is the document and this is all we have of record as to Mr. Ford's intentions.

Mr. WORTHINGTON. That is true.

Mr. MILLER. His only intentions are marked in this document.

Mr. WORTHINGTON. That is true, but could not—

Mr. MILLER (interposing). Anything else we have is a matter of pure speculation.

Mr. WORTHINGTON. Well, Mr. Miller, could I not put it in this way. You will grant, will you not, that the large volume of secondary power ought to be converted into primary power, if possible?

Mr. MILLER. It will be if there are enough dams built on the Tennessee River.

Mr. WORTHINGTON. Yes; or some other river.

Mr. MILLER. It would all be primary.

Mr. WORTHINGTON. It ought to be but there is a little more than the mere letter of the agreement that you could draw conclusions from.

Mr. MILLER. We do not want to let our enthusiasm get the better of us here, Mr. Worthington, because the beautiful picture that has been drawn may be dimmed somewhat.

Mr. WORTHINGTON. You do not alarm me by that suggestion.

Mr. MILLER. Up to the present hour, how many dams are there on the Tennessee River between Chattanooga and its mouth?

Mr. WORTHINGTON. Only one.

Mr. MILLER. In all the centuries that have gone by, there has been built only one dam, and how much does that generate?

Mr. WORTHINGTON. The installation is 54,000 horsepower and the lowest minimum in the driest season, I believe, is 14,000.

Mr. MILLER. It has been my real observation here and my caution not to get too rosy a picture of this thing because the power that Mr. Ford or Mr. Ford's company is going to turn out at this point can not be disposed of under such terms as Mr. Ford wants it to be disposed of.

Mr. WORTHINGTON. No.

Mr. MILLER. It will be controlled by your public utility commission of Alabama.

Mr. WORTHINGTON. That is absolutely so.

Mr. MILLER. And from that angle it is entirely impersonal whether the dam is under Mr. Ford's company or under the John Doe company.

Mr. WORTHINGTON. That is true.

Mr. MILLER. You are interested in the generation of that power and its availability for industrial purposes, but the price at which it is to be sold to the consumer is controlled by your commission down there.

Mr. WORTHINGTON. Yes.

Mr. MILLER. If this enterprise should terminate in a glowing financial success there would probably be other like establishments on the Tennessee River in the nature of hydroelectric plants until your entire river would be developed, and it is not beyond reason to picture that some day, but up to this good hour there has been only one plant that has gone in there out of all this glowing territory with all these beautiful prospects, and we have behind us the good old admonition that man has overlooked it all and probably he is the only one who is vile. But Mr. Ford will have this advantage, the Government is financing him at 4 per cent and he is amortizing the plant, compounded against the Government. Now, I use that expression "against the Government," because the definition of an amortizing fund is to pay a debt to the Government and that project owes the Government so much money and it can only be paid out of this amortization fund by compounding it against the Government and Mr. Ford getting the benefit of the compounding.

Mr. WORTHINGTON. I was just hoping you would make it a little clearer there as to Mr. Ford's advantage—the advantage you say he gets.

Mr. MILLER. He gets his amortization fund running at compound interest, and it would have to in order to yield enough to amortize the plant.

Mr. WORTHINGTON. Yes; but as far as that is concerned, if you wanted to, you could have a sinking fund set up on any Government venture, and that is right where this proposition comes to the forefront as entirely different. If you were to put the Panama Canal on the basis of Mr. Ford's offer it would fall short by \$20,000,000 a year plus. Suppose you had put the Reclamation Service on the same basis, it would fall short some \$8,000,000, and if you had charged on the Ohio—and do not understand that I am knocking the Ohio at all, because that is not the proposition, because I could take any other river. We can take the Missouri, if you want to; but, taking the Ohio River, if you had charged 1 per cent since 1827 you would have "busted" the Government. That is what would have happened and that is right where the difference comes in here. As to the 4 per cent, which is admittedly lower than you can place water-power bonds, I want to tell you that Mr. Ford, I think, will be heard from. I think the country will hear from him further on the subject of the burden to the industries of this country on account of high rates of interest for power developments. Now, it is not an advantage that he gets by the Government financing this project or lending its credit at 4 per cent, as you stated, because the consumer gets it. The consumer gets it; and, if it was possible—and I hope to interest you in this subject wholly apart from this hearing, if you will allow me to—if it was possible to have these powers developed, say, in your own State and in other States at 2 per cent, we could pay high wages and beat any country in the world in the cost of production and in the markets of the world.

Mr. MILLER. I notice you made an observation regarding the Panama Canal. Of course, we want to keep clearly in our minds the fact that the Panama Canal was built for strategic reasons and never as a commercial enterprise.

Mr. WORTHINGTON. Yes.

Mr. MILLER. It was never built with the view of making it self-sustaining. The lesson that America learned with reference to building the Panama Canal was the voyage of the old ironclad *Oregon* around Cape Horn in order to get to the seat of war, and from that good hour America became busy in securing some means of getting her battleships to possible seats of war other than by going around Cape Horn, and the Panama Canal was the solution of that problem and it was built, and it is there for that purpose now, and the commercial use of it is merely incidental. The same thing is true, exactly, with reference to the building of this Nitrate Plant No. 2. Its primary purpose was for war, and its secondary purpose, like the Panama Canal, was for peace and for the pursuit of peace, and to my mind it is just as dangerous to part with the title of that one enterprise as it is to part with the title to the Panama Canal. As I have said, the only argument against that is that we are perhaps getting through this leasehold interest and through its various provisions the same amount of protection that we would get if we held the title to it.

Mr. WORTHINGTON. Would you not think it good business if you could sell these battle cruisers and battleships to somebody who would keep them up and run them and let you have them any time you wanted them?

Mr. MILLER. No, sir; I would not. My colleagues might not agree with me, but I would never sell a battleship to anybody else and let them run it.

Mr. WORTHINGTON. Then I will put it in another way: Would you not be willing to sell these ships in your Shipping Board and have somebody run them and let you have them back when you wanted them?

Mr. MILLER. Well, now, we are getting into another field. For my part, that has so many angles that I am afraid we would get clear afield.

Mr. WORTHINGTON. I agree with you.

Mr. CROWTHER. Mr. Worthington, this morning you seemed to take some little pleasure, as other witnesses do, in castigating Congress and chastising Congress for their inaptitude in grasping the importance of many of these questions. I do not mean this present committee, but Congress as a whole. I realize that the favorite outdoor and indoor sport in this country is to pound Congress for their various lack of capabilities.

Mr. WORTHINGTON. I did not quite put it that way, Congressman.

Mr. CROWTHER. No; but I simply wanted to say that in order for a man to represent his constituency and come down here and be on a committee and attend all these hearings he would have to know more than there is in the Encyclopedia Britannica and be informed about everything in the world. Some of the questions asked by members of the committee, no doubt, expose their ignorance.

Mr. WORTHINGTON. Oh, no.

Mr. CROWTHER. I am speaking of myself entirely; and they seem to convey the idea to many of the witnesses that we are hostile as a body to every proposition that is before us.

Mr. WORTHINGTON. No; I did not mean to convey that.

Mr. CROWTHER. It seemed to me you did this morning.

Mr. WORTHINGTON. I want to be understood as not meaning that. I poorly expressed, perhaps, what I did mean. What I meant to say was that, since a Member of Congress is not a trained engineer, it is difficult for the engineer to get contact with him. That is what I meant.

Mr. CROWTHER. To get it into his head, you mean.

Mr. WORTHINGTON. Well, I do not mean that either. I certainly did not mean to attack or question the intelligence of Congress. Many people are highly intelligent on one subject and at the same time on another subject it is impossible to get connection with them. I think you will agree to that, will you not?

Mr. CROWTHER. Very often a question is asked by a member of the committee and is answered and that conveys the idea through the press immediately that he is or is not violently opposed to a particular measure, and those things develop. I want to ask you one or two questions, not from a legal standpoint, because like Mr. Greene, of the committee, I am not a lawyer. All the rest of the members of the committee, I believe, are lawyers, and there has been some suggestion that lawyers make poor legislators because they are vastly more concerned about the establishment of precedents than they are about actual accomplishments. I do not know that that is so, and I make that statement with all due deference to the members of that profession. What I think would be of interest and would be a necessity for this committee in order to present the matter to the members of the House and to the country at large would be, as suggested by Mr. James this morning, an actual statement as to the amount of fertilizer that is to be produced, because in this quasi legal document, incidentally, there is one paragraph which to my mind is demagogic and did not belong in the agreement, and this section 15, as I understand it, was adopted at the suggestion of agricultural and farm bureaus and several other societies who wrote that section the way it was put in here.

Mr. WORTHINGTON. No; I must correct that impression altogether.

Mr. CROWTHER. I am glad you are going to correct that, because that statement has been made.

Mr. WORTHINGTON. They did not do anything of the sort, and anyone who intimated that they did was doing an injustice to Mr. Ford and those who were associated with drafting his offer. I will say, though, that when this paper came to the point of actually getting on the road to this committee the farmers were consulted about the language, and there was nothing wrong in that, was there?

Mr. CROWTHER. Nothing wrong, particularly, except I do not see the need for using that language. Why could you not say, as is stated in one other line, "in order that commercial fertilizer," but instead of that it says, "in order that the farmers may be supplied with fertilizer at fair prices and without excessive profits, the company agrees," etc. It keeps referring to the close

relationship between this project and the advantages to the farmer that are to accrue.

Mr. WORTHINGTON. I wanted to get the opportunity to say that the language employed was so employed in order to carry the thought to you that the fertilizer was to get to the farmer as directly as possible.

Mr. CROWTHER. That is exactly what I have wanted to find out and what I have asked about several times, and I do not believe as yet we have had a definite answer about it. I think Mr. Miller commenced earlier in the investigation to inquire as to whether or not Mr. Ford was to carry through the process from the production of the component parts, ammonium nitrate, etc., to the finished product of fertilizer, which he was to deliver to the farmer and which, as Mr. Quin said, they expected Uncle Henry to deliver to them just the same as he did their Ford cars.

Mr. WORTHINGTON. I do not think there is any doubt about that.

Mr. CROWTHER. Do you think there would be any objection on Mr. Ford's part to stating and having in the contract about what they think might be produced, deliverable to the farmers, in minimum tons, commensurate with the production?

Mr. WORTHINGTON. I do not think so.

Mr. CROWTHER. You spoke of phosphoric acid this morning. Of course, that is a component part of fertilizer?

Mr. WORTHINGTON. Yes.

Mr. CROWTHER. And that would be covered by the language in the section with reference to the production of nitrogen and other fertilizer compounds?

Mr. WORTHINGTON. Yes.

Mr. CROWTHER. That would cover that part of it very well.

Mr. WORTHINGTON. With regard to phosphoric acid produced by electric-furnace methods, and I think that phosphoric acid produced by electric-furnace methods is leading the fixation of the nitrogen of the atmosphere, and I am going to suggest that instead of my going into that field, that, as I understand it, Mr. Swann is coming here, and to undertake to describe it would be a duplication, because he will be so much more intelligent and interesting than I can possibly be and more instructive.

Mr. CROWTHER. Who is Mr. Swann?

Mr. WORTHINGTON. Mr. Swann is president of the Federal Phosphorus Co.

The CHAIRMAN. I have invited him to appear after Mr. Worthington is through.

Mr. CROWTHER. In answer to Mr. Miller, you spoke of the probability of developing not only this nitrate industry but things that would develop the whole agricultural industry or tend to their development. Just exactly what did you have in mind by that? One of our witnesses called attention to the fact the other day, and I think Mr. Mayo acquiesced in the statement, that it was quite possible that great plants would be constructed there for the manufacture of all sorts of farming implements and that implements of every conceivable kind might be produced there, and in addition to that, the No. 1 nitrate plant, which was constructed to produce ammonium nitrate by the Huber process, being a failure, was going to be used as an automobile plant. Now, of course, while it may be difficult and Mr. Ford may think it is not necessary for him to put in this contract what he has a vision of as regards future production, still I think this committee and the people of the country would like to know what the present prospects before them are with regard to fertilizer production.

Mr. WORTHINGTON. Well, Mr. Ford has said in my presence more than once, and so has Mr. Mayo, in our discussions of the subject, that it was entirely possible that the fertilizer end of this development would be the major end.

Mr. CROWTHER. That that would be the major end of this entire proposition?

Mr. WORTHINGTON. Yes, sir.

Mr. CROWTHER. When he went down there that was one of the things that was farthest from his mind, was it not?

Mr. WORTHINGTON. Let me impress you with the fact that at that time Mr. Ford had never looked into this question of producing soil food by electric-furnace methods and by using cheap water power, and did not believe in the game at all. He twitted me rather unmercifully about this whole proposition, but when he got deeper into it and the facts were laid before him he seized it.

Mr. CROWTHER. You have testified also during the course of your testimony or suggested that in connection with the tremendous explosion which caused such a terrific loss of life abroad, that that proposition would probably not

be considered—that is, the development of the air-reduction plant, using the Haber process.

Mr. WORTHINGTON. The modified Haber process for nitrate plant No. 1, as designed; no, sir. That is a plain business proposition. It has never been worked out, and my information is, from those who are vastly better informed than I am, that it is not suited to this country at all. We have not yet attained technical perfection for any such plant. Germany has, and Germany has paid the sad lesson for using the Haber process. Whatever did happen that caused the explosion I do not pretend to say, but the explosion happened at the Haber plant.

Mr. CROWTHER. It was testified before the committee that there was an investigation being made to find out what the cause was.

Mr. WORTHINGTON. I believe there is an investigation going on at this time.

Mr. CROWTHER. It has been testified here that ammonium nitrate itself is not especially explosive. It can be detonated, but not easily.

Mr. WORTHINGTON. That is true.

Mr. CROWTHER. You spoke about Mr. Ford having this vision before him, of reducing the price of hydroelectric power for manufacturing purposes, and you pictured the tremendous burden industry was carrying because of those high prices.

Mr. WORTHINGTON. Yes.

Mr. CROWTHER. Do you know whether or not he intends to establish, from this 1,000,000 horsepower, new rates, and intends to let the people have the power cheaper than has been customary, or will he be prohibited from doing that by the State laws and the public utilities commission? Will he thus be prohibited from disseminating power at a lesser rate than is being charged? Has he any philanthropic vision as regards very much cheaper power and carrying through this cheap horsepower?

Mr. WORTHINGTON. Yes; I think he has.

Mr. CROWTHER. So that the people will be able to light their houses and apply the power to their other needs?

Mr. WORTHINGTON. Yes; what he wishes to get at is this: He wishes to take the interest burden off of power, and he thinks there ought to be a policy established in this country to do that.

Mr. CROWTHER. He is making a good start, paying only 4 per cent and compounding the interest.

Mr. WORTHINGTON. He will, I think, establish other enterprises on the Tennessee River on his own account.

Mr. CROWTHER. You spoke this morning of the applications that were made under the Federal water power act. I have a copy of the magazine published here in Washington, within the last week, which published the entire list as of January 1, 1922, and I notice that those applications cover practically every site in the United States.

Mr. WORTHINGTON. That is a fact.

Mr. CROWTHER. I noticed very few of them had an approximate amount of horsepower that would be developed to a very large extent, and two of them—one with 54,000 horsepower and one with 60,000 horsepower—had a great deal more than any one project in Germany. I also noticed that although the aggregate made a total horsepower which was astonishing, yet only a very small proportion of them were acted on, about 30 altogether, I believe. How long are those applications good for? How long can they keep those applications in effect or hold them?

Mr. WORTHINGTON. You mean how long does the application hold?

Mr. CROWTHER. Yes; is there no limit?

Mr. WORTHINGTON. Would you let me put an answer to that in the record? I do not recall exactly, but I will answer it as definitely as possible in the record. I do not exactly remember that at the moment.

Mr. CROWTHER. I will be glad to have you do that.

Mr. WORTHINGTON. I will put a more detailed answer to that in the record.

NOTE.—The Federal water power act approved June 10, 1920 (Public, No. 280), contains the following:

"Sec. 5. That each preliminary permit issued under this act shall be for the sole purpose of maintaining priority of application for a license under the terms of this act for such period or periods not exceeding a total of three years, as in the discretion of the commission may be necessary for making examinations and surveys, for preparing maps, plans, specifications, and estimates, and for making financial arrangements. Each such permit shall set forth the conditions under

which priority shall be maintained and a license issued. Such permits shall not be transferable, and may be canceled by order of the commission upon failure of permittees to comply with the conditions thereof."

Mr. CROWTHER. I notice that the corporations existed in the big cities, some of them far distant from the point for which the application was made, until they had a territory on the 1st of January which pretty well covered the entire United States, wherever there was available water power.

Mr. WORTHINGTON. That is true.

Mr. PARKER. I think Mr. Crowther asked you a question awhile ago that you did not answer: That is, whether Mr. Ford would agree to make a finished fertilizer to the minimum quantity put in the contract; that is, whether he would agree to make a minimum quantity of the finished fertilizer?

Mr. WORTHINGTON. I think if the honorable Member would look at section 14 he will agree that Mr. Ford binds himself to produce the approximate annual capacity of the present plant, and that can be stated at 110,000 tons of ammonium nitrate and the equivalent thereof. That is the minimum.

Mr. PARKER. That is the minimum of the components of fertilizer. The question is whether he will make finished fertilizer that would include or be equivalent to that amount of nitrate.

Mr. WORTHINGTON. It would be very difficult to do that. Without speaking for Mr. Ford or Mr. Mayo, and undertaking to give my own opinion, if it would add anything to it at all—

Mr. PARKER (interposing). You have no authority to speak for Mr. Ford?

Mr. WORTHINGTON. Not to agree to that. I would say possibly it could not be done, but I do not believe anybody knows. The field is so promising that I think you will decide to hear some other witnesses in connection with that. My opinion is it will go into a very large tonnage of completed fertilizer.

Mr. HILL. Mr. Worthington, you said that all this Muscle Shoals proposition could be narrowed down to one thing—capital.

Mr. WORTHINGTON. That is right.

Mr. HILL. As I understand it, Mr. Ford contemplates putting a very large sum of money into the development of this property if he receives it under this contract?

Mr. WORTHINGTON. He necessarily will have to do that.

Mr. HILL. Have you ever received any idea from him as to approximately how much money he would expect to put into it, outside of the money he pays to the Government?

Mr. WORTHINGTON. I do not think I have ever heard Mr. Ford say definitely how much it would be. I venture the assertion that he does not know. But I have gotten this measure in talking to him and to Mr. Mayo, that necessarily ten or fifteen million dollars would have to go in, and rapidly, if he puts this power to work, and he would have to go at it rapidly. I get the impression that it would finally run to forty or fifty million dollars.

Mr. HILL. Then, it is your impression that Mr. Ford's plans would contemplate—

Mr. WORTHINGTON (interposing). How much more than that I can not say, and that is a conclusion that I have drawn from my association with them. I expect I am straining the proprieties to say what I think about it, but I want to talk to you as frankly as possible.

Mr. HILL. I do not want to ask you any improper questions.

Mr. WORTHINGTON. I know you do not.

Mr. HILL. As I understand it, from your conversations with Mr. Ford, you think he might put in as much as forty or forty-five million dollars on this project?

Mr. WORTHINGTON. I do not see how he is going to use this power unless he does do it.

Mr. HILL. That is precisely what I have in mind.

Mr. WORTHINGTON. He has to do it; there is no market for it; he can not sell it.

Mr. HILL. In other words, it is your view that in order to utilize this project, which I understood you to say was, mainly, in the beginning at least, a power project, that Mr. Ford would have to put into it, in your opinion, \$40,000,000.

Are you able, without disclosing any confidence, or with propriety, to give the committee an outline of about what that \$40,000,000 would be expended for in this plant. We are all very anxious to know the details of this proposition.

Mr. WORTHINGTON. You are no more so than I am.

Mr. HILL. We have a responsibility that perhaps you do not have; we have to vote on this proposition.

Mr. WORTHINGTON. I am mindful of that, and I wish I could say something on that line that would be so reliable as to be worth something to the committee. All I can tell you is that Mr. Ford, in speaking to his staff, or some of them, when they wondered how it would be loaded, said he would load it. That is all I know, and I believe he will do it.

Mr. HILL. I am not in any way questioning your confidence in Mr. Ford. The question with us here is to know exactly what the proposition is that we are going to refer to the House. As I understand you, you gathered from Mr. Ford that he expected to spend about \$40,000,000. Do you not think we ought to ask Mr. Ford to come before this committee and tell us what his project is, because Mr. Mayo is not at all sure how much he proposes to spend, and so far no one else has been able to tell us.

Mr. WORTHINGTON. I want to be very frank with you.

Mr. HILL. You have been, and that is what we expect.

Mr. WORTHINGTON. I do not think it will accomplish anything to ask him to come. I do not think he could absolutely satisfy this committee if he did come.

Mr. HILL. Is that a reflection on the intelligence of the committee, or on the inability of Mr. Ford.

Mr. WORTHINGTON. No, sir, neither; I am thinking about the difficulty of anybody answering what you ask. But I would like to suggest a remedy for that situation; that you have this assurance; that whether he loads this power or finds consumers for it, he has to pay you 4 per cent on the cost, beginning at the end of four and three years, I believe.

Mr. HILL. As it will cost the Government about 4½ or 4¼ per cent to get the money on which he will pay 4 per cent, that argument does not appeal to me very much. What I would like to find out—and apparently my question is a very difficult one to answer—is this: You said you got from Mr. Ford, or from your conversation with him—and you have testified that you have been associated with him for about eight months in this matter—you stated he had led you to believe he expected to spend about \$40,000,000 ultimately in this matter.

Mr. WORTHINGTON. Let me put it in this way, that I concluded that he would have to do so from what he said he was going to do.

Mr. HILL. Precisely; and I want you to tell the committee what things he told you on which you concluded he would put in \$40,000,000. If I tell you I am going to buy a Ford truck and a Ford tractor and a Ford car, you conclude that I will spend about \$1,200. As I understood you, you told me that Mr. Ford told you he would put in about \$40,000,000.

Mr. WORTHINGTON. No; I did not say that.

Mr. HILL. You said you concluded he would spend about that amount.

Mr. WORTHINGTON. That is somewhat different.

Mr. HILL. Will you tell the committee what statement Mr. Ford made to you which led you to conclude he was going to put \$40,000,000 into this business?

Mr. WORTHINGTON. I think I stated that, but let me see if I can get it before you again. With a rather imperfect knowledge of how much it takes to finance, say, an aluminum development, I concluded that when Mr. Ford said he was going to try to make aluminum, and possibly some of its alloys, and having had some association in the past with a nitrogen-fixation interest, and having had the opportunity to see estimates that were made on operations that might be carried on at Muscle Shoals if this power were developed, altogether, in summing up my associations and experience, I thought he could not get out for less than forty or fifty million dollars. That is just as clearly as I can state it.

May I supplement that with the information I got from past associations that run over several years, and I think it would be relatively accurate, but I can not do it now? If you will give me the opportunity, we can bring to you some estimates that were made to this very committee.

Mr. HILL. Stated to this committee?

Mr. WORTHINGTON. I do not mean this committee in this Congress, but stated to the Military Committee and to the Agricultural Committee in a previous Congress. I do not know whether such suggestions by one in my position are appropriate, but I think I could bring you some information that would clarify the case you are now inquiring about.

Mr. HILL. In my opinion, any witness who appears before a committee of Congress to give information to the committee is doing a very great public service, and we want to hear everything we can hear which would have any bearing on this very important problem.

What I have been trying to find out by my questions to you is the amount of money Mr. Ford proposes to spend on this project which is now before us for consideration. As I recall it, the highest amount that Mr. Mayo was willing to say definitely that Mr. Ford contemplated expending was about \$5,000,000. I say that subject to correction. You said it was about that amount, did you not, Mr. Mayo?

Mr. MAYO. That is not correct.

Mr. HILL. How much did you say Mr. Ford contemplated putting into this plant outside of what he would pay the Government?

Mr. MAYO. If I remember correctly, I said I thought it would take about \$5,000,000 in addition to operate the nitrate plant, and the total amount would probably run not less than \$25,000,000 or \$30,000,000, or even in excess of that. It has always been my opinion that he would probably have to spend eventually approximately \$50,000,000.

Mr. HILL. Could you file in the record an estimate or a statement of what the \$50,000,000 would be spent for, in a general way, without betraying any confidence?

Mr. MAYO. I do not think I would want to disclose that. I might add that when we built what we call the Rouge plant at Detroit we finished the project which cost us nearly \$50,000,000, and the balance of the work to go along with this nitrate plant we thought would reach about that amount.

Mr. HILL. Your testimony was there would be about \$5,000,000 more needed for nitrate plant No. 2?

Mr. MAYO. Yes, sir.

Mr. HILL. What amount would be necessary for producing fertilizer?

Mr. MAYO. That is a pure conjecture, because if the process is changed it might greatly change the amount.

Mr. HILL. There might be as much as \$45,000,000 additional put into the project which Mr. Ford would have a perfect right to use there?

Mr. MAYO. Yes; it is my own personal opinion that that would be the minimum.

Mr. HILL. Now, Mr. Worthington, all these questions are based on your suggestion that this Muscle Shoals proposition can be narrowed down to one thing—capital?

Mr. WORTHINGTON. Yes.

Mr. HILL. Apparently Mr. Ford has in mind putting in about \$5,000,000 to make nitrate plant No. 2 available for the production of fertilizer or whatever other necessities may arise in reference to that particular plant. Outside of that, he has projects which are so big and so important to the general public that they have excited a great deal of public interest through the press. So the attitude at the present time of a great many people is that Mr. Ford is offering to do, through this proposition, a thing of very great and very general benefit to the whole American people, especially to the farmers. That impression is quite general. It is one that is gained through the newspapers. Now, it seems that Mr. Ford is proposing to put up perhaps \$50,000,000. At the same time he is asking the United States to advance a very large sum of money, the Secretary of War says about \$50,000,000. Have you had any talks with Mr. Ford as to the amounts he thinks the Government would have to put up to finish the dams? There has been some uncertainty as to that amount.

Mr. WORTHINGTON. Well, Mr. Ford thought that the work on the dams and the powerhouses, not including the navigation locks, such part as should be charged to navigation, would call for about \$30,000,000, or he suggested that amount. That was not very far away from other estimates.

Mr. HILL. Now, we have a range, say, from thirty to fifty million dollars, one being Mr. Ford's estimate and one being the estimate of the Army engineers, for the completion of the project.

Mr. WORTHINGTON. Taking Mr. Ford's estimate at \$30,000,000 and leaving out, which he did, the cost of that portion of the work that should be charged at the two dams to navigation, you can not quite draw a parallel, because in the case of the engineers' estimate, of course, they included the locks. I do not know what they are going to cost. We did take the trouble to find out what they possibly could be let at, and that was around \$40,000,000. I do not mean that Mr. Ford did; Mr. Mayo and myself and Mr. Waldo and others, in order to remove uncertainty and get away from this troublesome thing of estimates made by various people, made an estimate, and it looked like it was \$40,000,000, perhaps, and certainly not over \$42,000,000.

Mr. HILL. Then, Mr. Worthington, we have a situation in which the United States would have to advance vast amounts, roughly, from the Treasury, for the purpose of completing this project.

Mr. WORTHINGTON. Yes.

Mr. HILL. Would you mind telling us what, in your opinion, would be the benefits that the Federal Government would receive from its financing this proposition? Shall I say as a preface, that what is bothering me is this: Cheap fertilizer for the farmers is a very desirable thing. It is just as beneficial to the people in the cities as it is to the people in the country; we are inextricably tied up, and it seems to me it is a very false thing to raise a question between the city man and the country man on the matter of fertilizer. It is a question in my mind how far the Federal Government should go in the expenditure of credit for Government activities in trying to create cheap fertilizer.

The second thing is that it is very necessary to have our nitrates for use in time of war, and, of course, that is one of the big elements in this proposition.

Then, the third thing is that it is a very beneficial proposition, concerning which there is no dispute, that we need our water power developed. I know something about the water power situation in Switzerland and what it has done for Switzerland.

It being granted that cheap fertilizer is desirable, that preparedness in nitrates is now very essential and that the development of water power is most highly desirable, I would like your views as a departure in the policy of financing States would get out of what I regard as a departure in the policy of financing a private enterprise. That is the question in the minds of a great many of our colleagues. We have this project before us; so far nobody else has come along with a suggestion as to what should be done with it.

Mr. WORTHINGTON. Let us include navigation in there; will you not agree to that?

Mr. HILL. I would like to ask you about that.

Mr. WORTHINGTON. I would like to get you to include that before my answer is made.

Mr. HILL. I would like you to put in there anything else you would like to put in. The improvement of rivers and harbors is a very legitimate function of the Government. Would you make a statement as to what character of navigation that stream had been subjected to before the dams came in, and include that in your general answer? I know you said there had been certain navigation there.

Mr. WORTHINGTON. I answered Mr. Miller on that phase of it, I think.

Mr. HILL. What I did not understand then was about how serious was the navigation, about how much tonnage a year.

Mr. WORTHINGTON. Practically none, Congressman. Mr. Burton pronounced Muscle Shoals the most horrible example in all the rivers of this country.

Mr. HILL. I may say we have a certain amount of navigation on the Susquehanna River, but it is not very serious navigation, so far as the transportation of products is concerned.

Mr. WORTHINGTON. The serious thing about this was that there was not any. It was a nonnavigable stream; that is the truth about it.

Mr. HILL. Let me put the whole thing in a concrete form. Suppose I should be favorable to this proposition here and support the acceptance of the proposition on the floor of the House, and I go back to my people and they say to me, "What did you vote for this proposition for? What is in it for the American people?" Will you answer that question for me?

Mr. WORTHINGTON. Why not let me go into your district and do it?

Mr. HILL. I may ask you to do it, but I would like to have your answer it for me here.

Mr. WORTHINGTON. That is all right. In answering, of course, I will not answer except on the merits of the case as I see them. I think you are justified first because I think you will admit you are confronted with the necessity to complete Dam No. 2. The Secretary of War so advises you. You may get some one to take that off of your hands. I think you could say to your people that you are also confronted with the very important question of seeing to it that the purposes of that plant are preserved and ready.

Mr. HILL. That is, plant No. 2?

Mr. WORTHINGTON. Yes; in case we ever get into trouble. In the next place, I think you could say that, taking Mr. Ford's accomplishments and giving some credence and belief to what he says he will do, and considering, if you please,

that, if successful, you at least can expect that there will be created taxable values from the development of that power corresponding with what you find in North Carolina and California. And then, finally, there is the navigation improvement. I do feel you could say to your constituents that if you can vote appropriations for improving the navigation of the tributaries of the Tennessee River, and rivers like the Ohio and its tributaries, and the Missouri and other rivers, from which you do not get a penny of interest, nor the return of a penny of principal, you surely are justified in supporting this appropriation when we get 4 per cent, or practically 4 per cent on the Government's investment and the return of the principal.

Mr. HULL. That would be (a) completion of Dam No. 2; (b) the maintenance of nitrate plant No. 2 in stand-by or ready condition; (c) the general creation of taxable values which the Federal Government needs; (d) improvement of navigation, which has to be compared with the Ohio, the Mississippi and other river projects.

Mr. WORTHINGTON. Yes.

Mr. HULL. In that you have not included the fertilizer output for the farmer. That would be another element.

Mr. WORTHINGTON. I was going to leave that to say that I thought, and I really do think that has greater promise in it as a national contribution than any other phase of the case.

Mr. HILL. That has made a very great public appeal.

Mr. WORTHINGTON. I do not believe the public is going to be disappointed. It is going to take some courage and a lot of money.

Mr. HILL. The question in reference to the fertilizer that I am constantly met with is this question about which Mr. Miller and various other members of the committee have asked you. That is the question, how much actual fertilizer the American farmer is going to get.

Mr. WORTHINGTON. That is as hard to answer. I think, as to have tried to answer the question, if it had been asked, how much basic steel would the country get when the basic steel operations started in this country. You can not answer such a question in tons. I do not think you could answer that question to your entire satisfaction and bring it down to tons of completed fertilizer, not quite, because all of the field has not been covered. It is new; it is inviting. You are going to decide that yourselves before you get through with these hearings.

Mr. HILL. That answer is precisely what I should have expected you to make, and it is in line with what Mr. Mayo said. Nobody knows definitely how much fertilizer could be produced there; it is not possible to say?

Mr. WORTHINGTON. So far as the future, entire possibilities are concerned, you could not do that any more than if one had undertaken to predict how many Ford automobiles Mr. Ford would make if one had predicted it 18 or 20 years ago.

Mr. HILL. Then the maximum is uncertain. Would it be fair to ask that there be put into this contract a definite minimum of the amount of actual fertilizer, under clause 14?

Mr. WORTHINGTON. Would you indulge us to clear that up in answer to Mr. James's request that we put in a clarifying statement, which we have agreed to do? Will you allow that to answer your question?

Mr. HILL. I heard that question and that will cover it.

Mr. WORTHINGTON. We will undertake to do that.

(The statement mentioned will be found on p. 356.)

Mr. HILL. In connection with your expression in reference to the allotment, whether there would be any allotment of a definite amount of horsepower for the use of the fertilizer plant, and the nitrate plant, what would that be in value?

Mr. WORTHINGTON. In that particular case, measuring the production of nitrate plant No. 2 in ammonium nitrate, it would be about 110,000 horsepower.

Mr. HILL. You spoke of its being from 100,000 to 110,000 horsepower.

Mr. WORTHINGTON. Stating the production in terms of ammonium nitrate.

Mr. HILL. Would it be a thing for us to consider here in connection with section 14, concerning which there have been a good many questions—you probably recollect that the Secretary of War testified that he was not clear as to the guaranty for the production of fertilizer, so we have been particularly interested in section 14. Suppose we added to section 14, in the third line

after the words "ammonium nitrate per annum," something to this effect: "And that the company would promise to devote to the said production 100,000 of primary horsepower from dams Nos. 2 or 3, or from the steam plant at Gorgas, or the steam plant at nitrate plant No. 2 throughout the lease period." That is providing that there would be a devotion of a certain amount of horsepower to that production of fertilizer.

Mr. WORTHINGTON. That section absolutely carries that amount of power, that nitrate plant No. 2 is operated to the capacity production of 110,000 tons of ammonium nitrate, or its equivalent.

Mr. HILL. I so understand from you. Would there be any objection to putting that in as an amendment to the provisions of the section, that they devote a minimum of 100,000 horsepower to the production of fertilizer?

Mr. WORTHINGTON. You will, I am sure, appreciate how one in my position is situated right now; that I could not answer whether Mr. Ford would agree to that.

Mr. HILL. Would you mind talking that over with Mr. Ford?

Mr. WORTHINGTON. I will discuss it with Mr. Mayo and we will see what can be done.

Mr. HILL. I am obliged to you for your answers. I personally feel that any one who appears before a committee of Congress has an opportunity to serve the whole public in giving information. I thank you very much.

Mr. FIELDS. Mr. Worthington, following the last question of Mr. Hill, and the request made of you by Mr. James to put into the record a statement showing the amount of completed fertilizer that Mr. Ford proposes to produce annually, is it not a fact that they have made requests of you it is impossible for you to comply with unless they name a formula for fertilizer, upon which to base your calculation?

Mr. WORTHINGTON. In part that is true, but in this statement we will cover that and make it clear just what it does mean.

Mr. FIELDS. I believe you stated this morning that if the amount of ammonium nitrate to be produced at nitrate plant No. 2 was put into fertilizer on the basis of 2-8-2 it would produce 2,000,000 tons of completed fertilizer?

Mr. WORTHINGTON. Yes, sir.

Mr. FIELDS. If it should be mixed upon a different formula it would change the amount of the completed product; if it should be prepared, for instance, upon the formula of 14-8-2 it would mean 3,000,000 tons; if it should be prepared upon the formula 1-8-2 it would mean 4,000,000 tons. After all, it depends upon the mixture, upon the ingredients of plant food that go into the fertilizer and also the amount of filler which constitutes the larger part of the fertilizer?

Mr. WORTHINGTON. Yes.

Mr. FIELDS. To attempt to bind Mr. Ford at this time to produce a given number of tons of completed fertilizer, we would have to prepare a basis of compound upon which he should produce the plant foods and the filler, which the agricultural interests might want to change from time to time.

Mr. WORTHINGTON. I think that is substantially correct, and if you did that you might foreclose the opportunity for getting the greatest results out of the whole proposition.

Mr. FIELDS. But there is this assurance, however, that if this plant produces 190,000 tons of ammonium sulphate and it goes into the manufacture of fertilizer it will have to carry with it the other ingredients necessary with that ingredient to make the completed fertilizer.

Mr. WORTHINGTON. Yes.

Mr. FIELDS. And the agricultural interests of the country might want to continue to use fertilizer with a heavy filler, as they now use it, or they might want to use the highly concentrated fertilizers, as was described by Dr. Whitney before the committee on yesterday, which can be used with a great deal more economy when the country learns how to use them.

Mr. WORTHINGTON. Yes.

Mr. FIELDS. I believe, Mr. Worthington, you are an engineer, are you not?

Mr. WORTHINGTON. I was educated as a civil engineer.

Mr. FIELDS. As a citizen of Alabama you have been interested for many years in the improvement of the Tennessee River and its tributaries.

Mr. WORTHINGTON. Yes.

Mr. FIELDS. About how many years of study have you given to that?

Mr. WORTHINGTON. I have been tacked on to this Muscle Shoals proposition since 1901. Then in 1912 and 1913 I got interested in the entire river and its tributaries, and that interest has increased from time to time to the present.

Mr. FIELDS. You are probably as familiar with the natural resources of the Tennessee River Valley as any other man. For the information of the committee will you tell us something about the natural resources of the Tennessee River Valley that could be reached by the navigation contemplated by Mr. Ford.

Mr. WORTHINGTON. There is coal; there is some iron, and the upper reaches of the Tennessee carry the largest uncut hardwood supply in all the Southeast. The marble developments in the Knoxville district are well known, and that character of freight particularly ought to enjoy river transportation. In the field of raw materials that would serve the electric furnace industry I do not think many sections in the United States would, upon examination, be found superior to what you will find in the Tennessee Valley.

Mr. FIELDS. Are there many coal deposits there?

Mr. WORTHINGTON. Yes; I mentioned that. But you have copper, zinc, and other minerals. I wonder if you would not be good enough to let me supplement my statement by putting into the record a rather correct statement in regard to this matter?

Mr. FIELDS. I would be very glad to have you do that.

Resources of the Tennessee Valley and immediate vicinity.¹

¹ Area referred to is shown on map prepared by Tennessee River Improvement Association now on exhibit in House caucus room.

² From records of U. S. Geological Survey.

³ Values recovered given below.

⁴ Estimated.

⁵ Estimated from census returns.

Mr. WORTHINGTON. When I mentioned such things as copper and zinc, please understand they are being produced; I do not mean mere deposits.

Mr. FIELDS. Is there very much of this above Muscle Shoals?

Mr. WORTHINGTON. Nearly all of it. There are some mineral deposits south of Muscle Shoals; some clays that are important.

Mr. FIELDS. Then these minerals to which you referred have no water transportation now?

Mr. WORTHINGTON. There is no outlet for any of the raw or manufactured materials north of Muscle Shoals.

Mr. FIELDS. In answer to some questions propounded to you by the chairman you mentioned having severed your connection with the Alabama Power Co. I do not wish to ask you any questions that would be in any way personal, but from the correspondence of certain gentlemen in that section which has been made a part of the hearings, and from other contentions that have been presented, my curiosity has become a little bit aroused, I must confess. If I am wrong in my conclusions I want to get cleared up in my own mind, but if I am right I think the committee and the country ought to have the benefit of it.

You were first interested as a citizen in the development of the Tennessee River and its tributaries; that was before you became connected with the Alabama Power Co.?

Mr. WORTHINGTON. Pardon me; I did not quite get that, about being personally interested.

Mr. FIELDS. I say you were first interested as a citizen in the development of the Tennessee River?

Mr. WORTHINGTON. Oh, yes.

Mr. FIELDS. That interest on your part resulted in the severance of your relations with that concern. Why was it they were concerned in the development, or preventing the development you people were trying to bring about? Was it because they regarded it as a possible competitor?

Mr. WORTHINGTON. It is fair to say yes, but it was very natural for them to feel that way. I do not think I would say they are to blame for it. They had gone to relatively large expense; there is no question about that, and they had searchfully surveyed Muscle Shoals, and the most complete information on the subject to this day, in the public document you have here, I think, is as much due, or more due, to Mr. Thurlow, the chief engineer of the Alabama Power Co. than to any other engineer.

NOTE.—The document mentioned is House Document 1262, Sixty-fourth Congress, first session. It contains a survey and report on Muscle Shoals considered as a joint navigation water-power project, which was made in 1915-16 at a cost of about \$150,000.

Mr. FIELDS. I believe you stated they had acquired property.

Mr. WORTHINGTON. They had. However, the cost of the property they had there was negligible. They spent a lot of money on surveys, and they hoped, I suppose—of course, they hoped—to see the development made and to carry out their plans which they had proposed to the United States, but which I had to decide were hopeless. I had to make my decision on that point; and, on the other hand, they made their decisions in their own interests, and I do not think they are altogether to blame, and I am not going to confess that I was.

Mr. FIELDS. The thing that strikes me in connection with other things that have developed in the hearings is that here is an organization that is laying its plans to get hold of Muscle Shoals, if it can, and I do not blame them for that.

Mr. WORTHINGTON. It has a perfect right to try to get it.

Mr. FIELDS. But if it can not get hold of it, it is apparently trying to so retard its progress that nobody else can get hold of it, and thereby prevent it from becoming a competitor in its line.

Mr. WORTHINGTON. Well; you are carrying me into a field—

Mr. FIELDS (interposing). That was an expression of my own opinion.

Mr. WORTHINGTON. I would be criticizing some good fellows, perhaps, and maybe making a mistake in doing it, and I do not want to do that.

Mr. FIELDS. You will grant me the right to draw my own conclusions.

Mr. WORTHINGTON. Of course.

Mr. FIELDS. I believe the Alabama Power Co. claims to have an option upon a part of this property covered by Mr. Ford's proposition.

Mr. WORTHINGTON. Yes.

Mr. FIELDS. And the Air Nitrate Corporation claims to have an option upon nitrate plant No. 2. What is the connection, Mr. Worthington, if you know, between these companies?

Mr. WORTHINGTON. The American Cyanamid Co. and the Alabama Power Co.?

Mr. FIELDS. The Air Nitrate Corporation really is the American Cyanamid Co.?

Mr. WORTHINGTON. Yes; it is all about one.

Mr. FIELDS. Is there any connection between the American Cyanamid Co. and the Alabama Power Co.?

Mr. WORTHINGTON. I do not know what the intercorporate relations are now. I do not think I would be willing to testify on that point. When I was a director of the American Cyanamid Co. some of the leading controlling stockholders of the Alabama Light & Traction Co. were in the Alabama Power Co.; I do not know whether they are yet or not. I have not been interested enough for a long time to find out.

Mr. FIELDS. It is a fact that they were at one time?

Mr. WORTHINGTON. Yes. At one time Mr. Washburn was president of the Alabama Power Co. and at the same time president of the American Cyanamid Co. Their intercorporate relations were very close.

Mr. FIELDS. What are the activities of the American Cyanamid Co.?

Mr. WORTHINGTON. The operation of a very large air nitrogen fixation plant and the production of cyanimid in Canada at Niagara Falls. The extent of the American Cyanimid Co.'s operations in New Jersey I do not know, except that I think they produce ammonium phosphate, and they have very large phosphate operations in Florida.

Mr. FIELDS. Mr. James Duke is connected with the American Cyanimid Co.?

Mr. WORTHINGTON. Oh, yes; Mr. Duke. I think, controls it, he and his associates control it beyond question; they did at one time.

Mr. FIELDS. And they also control the Air Nitrate Corporation which claims to have an option on nitrate plant No. 2?

Mr. WORTHINGTON. I suppose they do, because that is all one; the Air Nitrate Corporation and the American Cyanimid Co., as far as this proposition was concerned, it seems to me, would be regarded as one.

Mr. FIELDS. You referred this morning to the power development of North Carolina and what it had meant to that State in the increase of revenue, etc. Was that water-power development?

Mr. WORTHINGTON. Oh, yes; it was hydroelectric development, about 400,000 horsepower is being developed in that State.

Mr. FIELDS. How do the possibilities of the Tennessee River and its tributaries compare with the development in North Carolina?

Mr. WORTHINGTON. Do you mean the Muscle Shoals development?

Mr. FIELDS. Yes; Muscle Shoals and those above.

Mr. WORTHINGTON. In answering that question one must ask for a very wide latitude, because the possible water powers on the upper Tennessee and its tributaries have never been surveyed. The tributaries upon which these powers may be possibly found—in which, indeed, many will be found—are regarded as navigable streams, and we have been trying to get the surveys made. I think it is possible some of those powers would be developed if the surveys were to be made, and by surveys I mean detailed surveys, like that at Muscle Shoals. That is what is the matter with the power on these streams, they are not surveyed.

Mr. FIELDS. How does Muscle Shoals, which has been surveyed, compare with the other water powers?

Mr. WORTHINGTON. One comparison would be this: The approximate total hydroelectric development in the Carolinas, Georgia, Alabama, and Tennessee is about 750,000, approximately the same as Muscle Shoals will be, but with more secondary power than is at Muscle Shoals.

NOTE.—The principal completed hydroelectric developments in the States named may be summarized as follows:

	Horsepower.
North Carolina	298,900
South Carolina	140,400
Georgia	129,400
Alabama	92,000
Tennessee	112,700
Total	773,400

Mr. FIELDS. Nitrate plant No. 1 has been referred to by some of the members of the committee. I want to add at this point that an officer of the Ordnance Department stated here the other day it would require about \$4,000,000 to equip nitrate plant No. 1 so that it would produce nitrogen as it was first intended to do. I judge that Mr. Ford would not want to put that additional \$4,000,000 upon that plant, and that is one of the reasons, possibly, why he may not consider using it for the production of nitrogen.

Mr. WORTHINGTON. For that reason quite largely, and others economic and conclusive.

Mr. FIELDS. There was one question asked here this morning which seemed to me you did not clearly grasp. That was whether this product that would be produced at plant No. 2 could be used for other purposes than the production of fertilizers. Could it be marketed?

Mr. WORTHINGTON. It would be impossible, in such quantity of production.

Mr. FIELDS. Therefore, if Mr. Ford produces 190,000 tons of ammonium sulphate at plant No. 2, annually, in order to find a market for it he must use it in the production of fertilizer and sell it as a fertilizer compound?

Mr. WORTHINGTON. We might illustrate that. Suppose there was a loophole in that agreement by which Mr. Ford might operate nitrate plant No. 2 in the production of nitric acid. Leave its capacity at 180,000 tons annually. It would not do him any good; there is no market for it. That is a basis for producing nitric acid that never happens in this country and perhaps never will, except in time of war, so it would not help him if he had an opportunity. And, further, if he should do that it would be forfeiting the confidence of the country.

Mr. FIELDS. You referred this morning to the relation of the production of power to labor. I do not understand you to claim that it will reduce the earning power of labor, but will increase its power of production.

Mr. WORTHINGTON. That is quite true, and you might carry that this far. Use this example: If you electrify the railroads you would relieve the coal miners of the mining of coal for those railroads and they would have to mine coal for some other consumer, or find some other work. And you would reduce, of course, the number of railway employees. That does not mean at all that you would reduce the per diem of those who did the work, but at the same time, understand, you would get a much cheaper transportation.

Mr. FIELDS. It would not, however, reduce the price of labor, just as farm machinery did not reduce the price of farming.

Mr. WORTHINGTON. Not at all. On the contrary, it would make it possible to pay what might be said to be a higher rate of railway wage and still have much cheaper transportation.

(Thereupon at 4.30 o'clock p. m., the committee adjourned to meet to-morrow, Friday, February 17, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Friday, February 17, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

STATEMENT OF MR. J. W. WORTHINGTON—Resumed.

The CHAIRMAN. Mr. Worthington, Mr. Fields, who finished his questioning last evening, desires to ask you just one more question, and then Mr. Quin will proceed.

Mr. FIELDS. Mr. Worthington, I gathered from the questions propounded by Mr. Miller that he has the impression that if the Government parts with title to Nitrate Plant No. 2 that it violates its policy enunciated in section 124 of the national defense act of 1916. As I understand that section and that act, the object of it was the production of nitrates, primarily for military use, and, as I further understand, the basis of that production is power. In selling Nitrate Plant No. 2, if the Government shall do so, does it part title with the production of power at Muscle Shoals, or is not that a part of Dam No. 2 and Dam No. 3 which remain in the Government in fee?

Mr. WORTHINGTON. Yes; the dams and the power facilities are merely leased, and the offer says that the power will be furnished to produce nitrates. As I understand you, your question refers to wartime needs?

Mr. FIELDS. Yes.

Mr. WORTHINGTON. It protects that very necessity.

Mr. FIELDS. As I understand it, section 124 of the national defense act of 1916 did not refer particularly to the construction or maintenance of any particular power plant, but its object was the production of nitrates, which is also one of the objects in the contemplated contract with Mr. Ford.

Mr. WORTHINGTON. No, sir, Judge; it just referred to nitrates and water power or other power.

Mr. FIELDS. It did not particularly refer to Nitrate Plant No. 2.

Mr. WORTHINGTON. It turns out in this case you have both water power and steam power.

Mr. FIELDS. And it further turns out, does it not, that thirteen of the twenty million dollars appropriated in that act has been expended on Dam No. 2?

Mr. WORTHINGTON. About that amount.

Mr. FIELDS. And that no part of it has been expended on Nitrate Plant No. 2.

Mr. WORTHINGTON. I understand that you are correct, and that that was testified to by the Ordnance Department.

Mr. FIELDS. Is it not also correct that Nitrate Plant No. 1 is the first plant that was constructed in pursuance of that act and proved a failure in its first operation?

Mr. WORTHINGTON. I am not very clear or positive about where those funds did come from or from what appropriations, but I am just told here that out of this \$20,000,000 in section 124 considerable expenditures were made at No. 1.

Mr. FIELDS. Anyhow, Nitrate Plant No. 2 has no direct connection with section 124, whereas Dam No. 2 does, because it was partly constructed from that appropriation.

Mr. WORTHINGTON. I think that is true.

Mr. FIELDS. And the title to that dam still remains in the Government if this lease is consummated?

Mr. WORTHINGTON. Yes.

Mr. QUIN. Mr. Worthington, you are an engineer, are you not?

Mr. WORTHINGTON. I was educated as a civil engineer.

Mr. QUIN. You are a citizen of the State of Alabama?

Mr. WORTHINGTON. Yes.

Mr. QUIN. How long have you been familiar with the Muscle Shoals territory?

Mr. WORTHINGTON. Well, I first saw this Muscle Shoals stretch on the Tennessee River in 1900.

Mr. QUIN. Twenty-two years ago.

Mr. WORTHINGTON. Yes.

Mr. QUIN. About what age gentleman are you?

Mr. WORTHINGTON. That is encroaching a little; however, Congressman, I have forgotten how old I am.

Mr. QUIN. You are old enough to be familiar with the river on which these dams are constructed and the surrounding territory?

Mr. WORTHINGTON. Yes, sir; I think I can qualify on that point.

Mr. WRIGHT. Mr. Chairman, if I may be permitted, I ask a question of privilege on behalf of the witness, because he is a bachelor.

Mr. WORTHINGTON. I am obliged to you.

Mr. QUIN. Mr. Worthington, some questions were asked here about the financial part of this thing. The money the Government has expended there in that dam would be a loss unless it was completed, would it not?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. Now, Mr. Miller questioned you about the rate of interest and what the aggregate of that would be for the Government's investment there. Are you familiar with the river and harbor legislation of the United States Government?

Mr. WORTHINGTON. Well, yes; in a general way.

Mr. QUIN. This Government has spent many hundreds of millions from the time it began the improvement of harbors?

Mr. WORTHINGTON. Yes; a little over \$700,000,000.

NOTE.—The actual total expenditures made for maintenance and improvement of rivers and harbors from the fiscal year ending June 30, 1896, to that ending June 30, 1920, inclusive, total \$703,053,456.35. (Statement compiled by J. H. McGann, clerk of the Committee on Rivers and Harbors, from the annual reports of the Chief of Engineers, in bulletin of National Rivers and Harbors Congress, March, 1921, p. 5.)

Mr. QUIN. All of the chief harbors of the coast of the Atlantic Ocean, the Gulf of Mexico, and the Pacific Ocean have been improved and are being maintained by the Federal Government?

Mr. WORTHINGTON. Undoubtedly.

Mr. QUIN. The river transportation of the United States has been under the appropriations and direct work of the Federal Government through its engineers?

Mr. WORTHINGTON. Yes.

Mr. QUIN. Has this Government ever received one dime in interest on any of those investments?

Mr. WORTHINGTON. Not so far as I know.

Mr. QUIN. The New York Harbor is for the benefit of all the people of the United States?

Mr. WORTHINGTON. Yes.

Mr. QUIN. The products of the farm, the factory, and the mine of the most distant States of this Union may go out of that harbor to the markets of the world?

Mr. WORTHINGTON. Quite true.

Mr. QUIN. And all the imports we receive through that harbor for the advantage of the people of the United States?

Mr. WORTHINGTON. Yes.

Mr. QUIN. And whenever a river is improved it is for the advantage of the whole population, is it not?

Mr. WORTHINGTON. Yes.

Mr. QUIN. When the Roosevelt Dam was constructed, at a cost of about \$15,000,000, for the immediate farm territory there, or to irrigate that land, that indirectly was for the benefit of all the people of the United States?

Mr. WORTHINGTON. Yes.

Mr. QUIN. There was never any interest charged by the Government for that dam, was there?

Mr. WORTHINGTON. I do not think so. I do not think any interest is paid on any of the appropriations to carry on your reclamation projects.

Mr. QUIN. Then the completion of Dam No. 2 and the construction of Dam No. 3 will be the same as any other river and harbor improvement, with the exception that this adds an additional increment to the values of the United States and is of material interest to all the people.

Mr. WORTHINGTON. Yes; that is true.

Mr. QUIN. And, as you have stated, it makes navigation certain.

Mr. WORTHINGTON. Very complete.

Mr. QUIN. And it adds about 800,000 horsepower, both primary and secondary combined.

Mr. WORTHINGTON. Well, it will depend upon what the engineers decide upon as a definite installation on Dam No. 3, but I think it is a better statement to say 700,000, or it may be 750,000.

Mr. QUIN. What would it be if the other dams are built up above by Mr. Ford as contemplated?

Mr. WORTHINGTON. If the dams on the upper Tennessee and tributaries should be built, it is a rough guess to say that there is a million horsepower there that could be developed above Chattanooga.

Mr. QUIN. In addition to this 700,000 you spoke of?

Mr. WORTHINGTON. Yes; but let me remind you that the surveys have never been made, and this is a rough guess.

Mr. QUIN. That is what we are driving at. We want this information for the benefit of the gentlemen who are to vote on this question and who are not members of this committee. As a matter of fact, it is improper, from a financial and economic standpoint, to be charging Mr. Ford with the interest that Mr. Miller speaks of on the dam construction in view of the Government's activities in river and harbor construction.

Mr. WORTHINGTON. Well, do you ask me a question?

Mr. QUIN. Yes, sir.

Mr. WORTHINGTON. I can only offer you my own opinion about it. I do not think that because the Government has found it necessary to make large appropriations for the improvement of our harbors and the improvement of the navigation of our interior rivers—I do not think that policy should necessarily apply to a joint navigation-water power development. On the contrary, just expressing my own private opinion, I think a plan or a policy could be set down all over the country whereby these powers could pay a large part,

and in some cases all, of the cost of the improvements. That means that the customers for power pay the bill and a local section bears the expense, but it also gets the benefit.

Mr. QUIN. They get the direct benefit.

Mr. WORTHINGTON. Yes.

Mr. QUIN. Mr. Worthington, you are familiar with the time that this dam was started down there?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. It was originated for two purposes, and I was on the committee that helped to do it. One purpose, and the primary purpose, was to establish a nitrate plant for the Government in time of war, and secondarily, for fertilizer for the farmers of this country in time of peace. There is no dispute about that. The whole record shows that to be the case. Now, peace is on. On the 7th day of February, 1921, the House of Representatives, the lower branch of the Congress of the United States, after long debate, by a majority vote of 7 determined not to continue the completion of Dam No. 2, and let me say that on that afternoon I had a bowed head and a sad heart. Now, the Congress by a majority vote, representing the people of the United States, has practically said that this thing is worthless and shall not be completed. Mr. Ford, through you, has presented this proposition to the Congress of the United States, and in this proposition he proposes to have that splendid nitrate plant ready at all times, with a working personnel, to turn over to this Government in case of emergency or in case of war or threatened war; is not that true?

Mr. WORTHINGTON. That is true.

Mr. QUIN. The consideration which he puts up to this Government is that in the completion of Dam No. 2 and the construction of Dam No. 3, he finances by \$55,000 a year the expense, practically, of maintaining both those dams for navigation.

Mr. WORTHINGTON. That is right.

Mr. QUIN. Then Mr. Ford has offered to this Government more than the United States Congress voted to give by its vote on the 7th day of February, 1921.

Mr. WORTHINGTON. Yes; that is true.

Mr. QUIN. He is the first and only man that has come forward in this time of dire distress and offered to take care of this great property, so far as this committee is concerned, or the Congress is concerned.

Mr. WORTHINGTON. Yes.

Mr. QUIN. Some gentlemen seem to be far afield on the idea of fertilizer. One gentleman of this committee insisted that the language in here where it says that it shall be for the purpose of making cheap fertilizer for the farmers is demagogic. Is it possible that because Mr. Ford in his proposition to the United States specifies that 110,000 tons of fertilizer and its components shall be distributed to the farmer under this offer is demagogic? Would you construe that to be demagoguery put upon the American Congress?

Mr. WORTHINGTON. Do you ask me the question?

Mr. QUIN. Yes, sir.

Mr. WORTHINGTON. You qualified me as an engineer.

Mr. QUIN. Did you ever farm any?

Mr. WORTHINGTON. Oh, yes; I have farmed.

Mr. QUIN. You were raised in Alabama, were you not?

Mr. WORTHINGTON. Yes, yes; and worked on a farm, too, but, Congressman, you know you did qualify me as an engineer.

Mr. QUIN. That is true, and I believe I can qualify you as a farmer; you look like I do.

Mr. WORTHINGTON. Well, I want to be excused from passing on that point. Of course, anybody that wished to do so could put their own construction on it, but I would rather not do that now.

Mr. QUIN. That is all right. You know some folks always accuse anybody of being a demagogue who says anything for the farmers.

Mr. WORTHINGTON. Yes; I have heard that.

Mr. QUIN. You stated in reply to a question yesterday that the Congress had not understood the water-power situation when it put a limitation on water powers of the United States at 50 years.

Mr. WORTHINGTON. Well, pardon me, Mr. Quin, it was not quite as broad as that. I said that I did not think this 100 years or 50 years proposition had been very clearly understood, and I thought it had been misunderstood.

Mr. QUIN. Well, you are right in part. The Congress of the United States was endeavoring to safeguard the people. You understand the record of congressional activity shows that certain great financial institutions had interlocking directorates, the same gentlemen would be officers and directors in one corporation that was to do the financing and be officers and directors in the thing they were going to finance, and so on, which would cripple legitimate industry. In other words, Congress was endeavoring to prevent them from exploiting the people, and that was the reason for this 50-year limitation. Now, in this instance, with this great proposition wherein 1,700,000 horsepower can be created, it is my judgment that a 50-year limitation is too little, especially when we are dealing with a man like Mr. Ford, who is a tried, tested, and proven friend of the plain people of this country.

Mr. WORTHINGTON. I think any reasonable man would say that there ought to be a longer period of time for a 1,700,000-horsepower project than 50 years. That is not a matter of legislation or anything of that sort; it is just a plain business proposition. You would want a longer time to develop seven coal mines or eight coal mines of 1,000 tons a day than you would one.

Mr. QUIN. Oh, it is manifest to my mind. The Aluminum Co., above there, you stated, had a perpetual lease or right in that water power.

Mr. WORTHINGTON. Yes; I think under the laws of Tennessee they have a perpetual ownership, but, Mr. Quin, I also made it very clear that I did not see any objection to it.

Mr. QUIN. Well, I do not, either. It depends on who it is that has it. If it is a great power of wealth that starts out to exploit both the Government and the consumers who are using the product of that power, then it might become a dangerous thing, might it not?

Mr. WORTHINGTON. Well, your question opens up a very wide field of discussion, and yet I must insist that the period over which they have their holding, even if perpetual, would have nothing to do with the selling price of their product, any more than the period of the lease of a coal mine would have anything to do with the selling price of the coal. I do not think that the period has anything to do with the subject at all. If you want to get regulation, if that is what you are looking for, you will have to reach it on some other basis than a period, and then, again, it looks to me as if your power law has been built up with a purpose and a plan, almost, of carrying the Government into the power business at the end of 50 years. I think you are going to have a great temptation, and with all the light before us, that is not a good thing, in my opinion.

Mr. QUIN. The railroads of the United States have their charters granted to them to operate?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. Those railroads operate, as a rule, for 100 years?

Mr. WORTHINGTON. I do not know what the usual length of a railroad charter is. I really do not know.

Mr. QUIN. The Government of the United States in the case of a great many of these roads, like the Santa Fe system, for instance, gave every other section of land along the right of way in order to have the railroad put through; did they not?

Mr. WORTHINGTON. There were very large gifts of land by the Government to the transcontinental railroads as well as the assistance of bonds.

Mr. QUIN. All of the railroads up until a few years ago, in fact, had these land grants. There were some 38 roads to my knowledge that had land grants in the United States.

Mr. WORTHINGTON. I think so.

Mr. QUIN. And in my own State they had immense grants.

Mr. WORTHINGTON. Yes.

Mr. QUIN. Figuring on the same basis that Mr. Miller figured about the value of interest, the interest at 4 per cent on the land granted to these railroads would bankrupt all the Governments of the world in 100 years, would it not?

Mr. WORTHINGTON. Well, it would make them pretty poor, I think, myself.

Mr. QUIN. The Government of the United States was after developing the country through which those roads would run, was it not?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. On that question of interest, Mr. Worthington. I notice that Elliot in his valuable work, on page 182, says that if Methuselah at the age of 21 years had loaned \$1 at 6 per cent, compounded yearly, at the time of his death, 948 years later, the interest would be 997 sextillions of dollars. That is just on \$1.

What would it be if the United States Government had charged 4 per cent on the value of all of these lands granted to these corporations known as railroad companies, or the money spent on river and harbor construction in the United States from the date we began to do that work up until this hour?

Mr. WORTHINGTON. It passes me.

Mr. QUIN. It is nonsense to talk about such a thing as my friend, Mr. Miller, does, when he talks about 4 per cent being too little for this great dam construction down there. That is going into the field of foolishness, is it not, from a governmental standpoint?

Mr. WORTHINGTON. Oh, I could not say that. I am on the defensive.

The CHAIRMAN. The gentleman will try not to be personal.

Mr. QUIN. I did not mean that in a personal way.

The CHAIRMAN. The committee is trying to conduct its hearings for the purpose of getting information and we will not indulge in personalities. We will get along better.

Mr. QUIN. I did not mean, Mr. Chairman, anything of that kind. It is this record I am after. The Members of the House will see from this record what we are driving at, and certain definite conclusions have been reached here from figures. If the Government of the United States pursues that wise and beneficent policy of public improvement and development for the benefit of all the people we will still have to ask the people to put up money for such improvements, will we not?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. Without the hope or expectation of any interest on it.

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. Except pro bono publico.

Mr. WORTHINGTON. Yes.

Mr. QUIN. The transportation question is one of the most serious that confronts our people to-day, is it not?

Mr. WORTHINGTON. Indeed, it is.

Mr. QUIN. The unit of power as well as the wage largely enters into the cost of transportation, does it not?

Mr. WORTHINGTON. Yes, indeed.

Mr. QUIN. There is no power known to man as cheap as water power, is there?

Mr. WORTHINGTON. That is the cheapest.

Mr. QUIN. Whenever a man has an investment that has a wheel to turn, with a whistle to blow, he had better look out to see that his expenses do not outrun his revenues, should he not?

Mr. WORTHINGTON. He had better be watchful.

Mr. QUIN. And as an economical way to turn that wheel there has nothing been found equal to water power, has there?

Mr. WORTHINGTON. No.

Mr. QUIN. In the pioneer days of this country the folks erected little dams across the creeks, put up their water mills to grind their corn and hominy and wheat.

Mr. WORTHINGTON. Yes, sir.

Mr. QUIN. And if they did not do it in that way they had to have a lever pulled by a horse or a mule or seven or eight men, did they not?

Mr. WORTHINGTON. Yes.

Mr. QUIN. They did not have steam engines to do it with in those days. With that almost primeval method of using the water still the people of this country do not yet appreciate what water power is.

Mr. WORTHINGTON. Well, I do not believe they do.

Mr. QUIN. I know that I did not until this project started, and I was raised on hominy and meal ground by one of those old-fashioned water mills. They did not have steam engines then and they called the place Hominy Creek. The agricultural interest of the United States is the basic interest of the country really, is it not?

Mr. WORTHINGTON. Yes; that is at the bottom of everything.

Mr. QUIN. All the people engaged in the manufacturing business and in all other lines of activity in this country depend directly on the man who tills the soil; is not that true?

Mr. WORTHINGTON. That is true.

Mr. QUIN. And those people who are tilling the soil, according to Government statistics, are heavily involved to-day, are they not?

Mr. WORTHINGTON. Undoubtedly.

Mr. QUIN. I understand that a few years ago the census reports or the Government statistics indicated \$1,750,000,000 of mortgages on the farms of the United States. To-day the estimates are that there are \$8,000,000,000 of farm mortgages in the United States. Something has caused that, has it not?

Mr. WORTHINGTON. That would appear to be so. Yes, something.

Mr. QUIN. Then, if there is any class of people in the United States who need to be helped through governmental agencies it is the farmer or agricultural class, is it not?

Mr. WORTHINGTON. Yes; I think that is so.

Mr. QUIN. How far is it from Muscle Shoals to the Gulf of Mexico?

Mr. WORTHINGTON. About 325 miles, I think, by airline; but I think it is, perhaps, 375 miles by rail. That is a rough estimate.

Mr. QUIN. The State of Alabama has large deposits of iron, has it not?

Mr. WORTHINGTON. Yes.

Mr. QUIN. And coal?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. And all kinds of ore?

Mr. WORTHINGTON. You mean iron ore?

Mr. QUIN. Yes, sir.

Mr. WORTHINGTON. Yes.

Mr. QUIN. And lime?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. They have cement works down there, have they not?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. The State of Tennessee has lime, cement, marble, and quarries of all kinds?

Mr. WORTHINGTON. Yes; and zinc and copper.

Mr. QUIN. And the timber interests are large in all of that territory tributary to the Tennessee River, both in Alabama and in Tennessee?

Mr. WORTHINGTON. Not so much in Alabama, but the upper reaches of the Tennessee River go into the largest uncut section of hardwood timber in all the Southeast.

Mr. QUIN. With the completion of Dam No. 2 and Dam No. 3 by the Government, and Mr. Ford's contemplated dams above there, aside from the development of this marvelous water power, you have water transportation directly from there to the Ohio River?

Mr. WORTHINGTON. To the Ohio and to the Mississippi.

Mr. QUIN. And, then, out of the Ohio into the Mississippi?

Mr. WORTHINGTON. Yes.

Mr. QUIN. And the Mississippi, both north and south, and, then, the tributaries of the Mississippi?

Mr. WORTHINGTON. That is right.

Mr. QUIN. With this work completed as contemplated, all of that raw material in that territory or the manufactured products made from it, can get out on the Tennessee River, go down the Ohio, up and down the Mississippi and its tributaries, into the very heart of the United States, so that the consumers can receive that product at a cheap rate of transportation.

Mr. WORTHINGTON. Oh, yes; that would follow.

Mr. QUIN. And if they wanted to, they could go down the Mississippi and into the Gulf of Mexico and thence to all the markets of the world.

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. Or they could go up the canal and into the Great Lakes through Chicago.

Mr. WORTHINGTON. Yes.

Mr. QUIN. The transportation alone would warrant the Government in the expense of finishing these two dams, would it not?

Mr. WORTHINGTON. I think it would. Of course, it is a large expenditure, a little unusual, to be sure, but if you take what you have done on other rivers and unless you decide you are going to reverse your policy, I would say "yes." Indeed, if you follow the same policy of expenditure on the Tennessee as on the Ohio, undoubtedly that is true; but as you know, there is a difference of opinion on that subject.

Mr. QUIN. And always will be.

Mr. WORTHINGTON. Perhaps so.

Mr. QUIN. As long as men talk. The main feature, aside from navigation, is the great water power that will be developed there.

Mr. WORTHINGTON. That, I think, is the primary industrial consideration.

Mr. QUIN. And that ought to attract the attention of all the people of this country.

Mr. WORTHINGTON. Yes, sir.

Mr. QUIN. The Chief of Engineers of the Government said that it was the finest water-power stream in the United States with the possible exception of the St. Lawrence, which is partly in Canada.

Mr. WORTHINGTON. Well, I can not agree with him entirely about that. I think it is among the very first power streams. Probably in the West they have some superior ones, but it is one of the very first.

Mr. QUIN. The amount of horsepower that will be required to manufacture this fertilizer according to the agreement in this contract would be how much?

Mr. WORTHINGTON. Well, right there, I would like to say that I do not think anyone could possibly tell how much it will take finally, and in order to clear that question up as far as I can to the committee I think it is a case of this sort: Some 18 or 20 years ago aluminum was, in a sense, a rare metal and there was only a very little of it produced, and it was sold at \$1 to \$1.50 a pound. Aluminum is now quoted at 26 cents and less, perhaps, and here is the direction of the answer to your question, which is the best I can make: There are 400,000 horsepower engaged in producing aluminum in this country. So the thought among many is that if you can cut the cost of aluminum from \$1.25 to \$1.50 down to 26 cents with water power, why may not you hope to cut the cost of fertilizer, using similar methods? If you did cut the cost of fertilizer in relatively the same way, then it would be hard to answer your question, because it would not be 100,000 horsepower, it would be 1,000,000 that would be needed, and more and more, of course.

Mr. QUIN. That would depend then on the relative increase of fertilizer output or fertilizer products.

Mr. WORTHINGTON. The consumption of fertilizer will be determined in tonnage by the cost of it. If it is cheap, they will use a great deal of it, and just as the curve of cost goes high the curve of consumption goes down.

Mr. QUIN. That is true. Some of my colleagues on the committee can not understand how they can make fertilizer in a concentrated form and get it to the farmer in that form. Prof. Whitney, I think, explained that.

Mr. WORTHINGTON. Well, Mr. Quin, if, perhaps, your comment is true, and I do not pretend to pass upon it, that matter would be cleared up by a gentleman who I understand is to follow me, absolutely, I think, to the satisfaction of the committee.

Mr. QUIN. Prof. Whitney cleared that up.

Mr. WORTHINGTON. Well, I did not hear him.

Mr. QUIN. I would like to put in, through you, an idea for those gentlemen on the floor of the House who have not heard these statements and for some of the members on the committee, perhaps, who can not understand it. You stated that you were reared on a farm. Did you ever see an old-time ash hopper?

Mr. WORTHINGTON. Yes, indeed.

Mr. QUIN. They took hickory and oak wood and put it in a barrel with some shucks at the bottom and poured water in and the lye dripped out.

Mr. WORTHINGTON. That absolutely happened.

Mr. QUIN. They were doing that to get the potash out of the wood for soap-making qualities, were they not?

Mr. WORTHINGTON. In the ash they did get fertilizer and they got nitrogen, too, I think.

Mr. QUIN. Then they took that lye and put it in a pot with some pork rind or waste pork fat and put a fire around it and boiled it to a certain temperature and they had soap, did they not?

Mr. WORTHINGTON. That was the process.

Mr. QUIN. It took the potash and other fertilizer ingredients to get that soap, did it not?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. And they had a barrel standing there that had 300 pounds of ashes in it which contained that soap or potash, and when the good housewife got through with it she had about 10 pounds of soap ready to wash the clothing and scrub the floors of the house.

Mr. WORTHINGTON. Yes.

Mr. QUIN. And, furthermore, you can go into any drug store and buy concentrated lye, can you not?

Mr. WORTHINGTON. Oh, yes.

Mr. QUIN. And without having to have it drip through that hopper of ashes in order to get this lye, they can now get a little can of lye that you can put in your coat pocket and that answers just as well as that whole barrel full of ashes would. Is it not then reasonable to suppose that the fertilizer can come out of the atmosphere through this process at plant No. 1 or plant No. 2 at Muscle Shoals, and have that fertilizer turned out in a concentrated form and save all of this waste of transporting useless materials with the fertilizer that is sent to the farmer?

Mr. WORTHINGTON. Oh, indeed, Mr. Swann will make that very clear to you if he follows me.

Mr. QUIN. There is no doubt about that?

Mr. WORTHINGTON. Oh, no.

Mr. QUIN. The fact is that a man with 10 or 15 acres of land could get enough of that concentrated fertilizer through parcel post to do him, could he not?

Then the question that the Secretary of War raised that Mr. Ford, according to his judgment, could not produce fertilizer or this nitrogen stuff cheap enough, will not hold water.

Mr. WORTHINGTON. Well, that was the opinion of the Secretary, to which I am very respectful, but I do not think he is a fertilizer maker.

Mr. QUIN. Well, I did not think so myself, but he held that if it could be done, he would be willing for this proposition with a 50-year period.

Mr. WORTHINGTON. Well, I think Mr. Swann will show you that it can be done.

Mr. QUIN. Mr. Worthington, they have in that immediate territory phosphate beds, have they not?

Mr. WORTHINGTON. Oh, yes; we have large deposits of phosphate rock in Tennessee.

Mr. QUIN. It will be no trouble to reach that phosphate rock from the Muscle Shoals plant?

Mr. WORTHINGTON. Oh, no.

Mr. QUIN. Do you know of another place in the United States as well situated for the economical manufacture of fertilizer and its compounds and products as the situation you have right there at nitrate plant No. 2?

Mr. WORTHINGTON. Not at all.

Mr. QUIN. Of all the places in the United States—

Mr. WORTHINGTON (Interposing). That, I think, is the cheapest in the United States.

Mr. QUIN. All the raw material is right handy there?

Mr. WORTHINGTON. Yes.

Mr. QUIN. And Mr. Ford knows that?

Mr. WORTHINGTON. Yes; I think he is confident of that.

Mr. QUIN. Some gentlemen are afraid that some earthquake or disaster will happen down there. Are you familiar with the history of the Tennessee River?

Mr. WORTHINGTON. Well, part of it for a period.

Mr. MCKENZIE. If you will pardon me, Mr. Quin, I think Mr. Worthington went over all that matter yesterday and it is now in the record, and I do think we ought to hurry along and not have repetition in the hearing.

Mr. QUIN. I want to show that there has not been any earthquake there. Is there any record in sacred or profane history of any earthquake in that territory?

Mr. WORTHINGTON. Mr. Quin, not to my knowledge.

Mr. QUIN. Well, from the time that mother earth trembled and shook herself and left that river standing there, there has not been an earthquake there, has there?

Mr. MCKENZIE. I think you will have to show that the witness was there all the time.

Mr. QUIN. Is it not reasonable to conclude that that same river will be running there, except we intend to harness it up and conserve that water power, from now on until the Angel Gabriel plants one foot upon the sea and the other on the land and blows his bugle on the day of judgment?

Mr. WORTHINGTON. Well, I think Mr. Ford is willing to take the risk in that respect, and the United States has already taken that risk.

Mr. QUIN. And the Government and the taxpayers would be willing to continue taking the risk of an earthquake.

Mr. WORTHINGTON. I could not answer for the taxpayers.

Mr. QUIN. The investment as contemplated by Mr. Ford from your conversations with him include the development of the dams above, and necessarily the employment of a world of labor.

Mr. WORTHINGTON. Oh, yes; there will be a very large number of people employed in connection with this matter, undoubtedly.

Mr. QUIN. The development of this cheap water power with the necessary industries incident to it would make all of that Tennessee River valley hum with industry, would it not?

Mr. WORTHINGTON. Yes; I think it would be quite unusual, perhaps. Of course, if the upper dams are built, it will take time to bring the hum which you mention.

Mr. QUIN. Oh, yes; I do not expect that this will be done in a day, but we are representing the people for the future as well as for the present. It is going to be, when it is completed, a large wealth and tax producer for the United States and the adjoining States.

Mr. WORTHINGTON. There is no doubt about that if the plan works out.

Mr. QUIN. Then, to offset this supposed interest charge on the Government in the construction of those dams, you have a saving in transportation of the products of that territory to the consumer, have you not?

Mr. WORTHINGTON. Very true; and particularly so in the cost of transporting the fertilizer, if the plan works out.

Mr. QUIN. I was just coming to that. You have, aside from the proposed cheapness in price, and it has been stated that Mr. Ford believes he can put it down to the farmers for one-half of what they are paying now, or at any rate, for 33½ per cent less—

Mr. WORTHINGTON (interposing). I agree with him about that.

Mr. QUIN. Then, upon the amount of fertilizer consumed in 1920, that is a saving of many millions of dollars to the American people; to the farmers directly and indirectly to the consumers of farm products. Then, aside from that, instead of carrying all this dead waste in the fertilizer, in hauling 2,000 pounds of that fertilizer when only 400 pounds of it is really fertilizer, you will save then in freight rates many millions of dollars during the course of a year or 2 years or 10 years, would you not?

Mr. WORTHINGTON. That ought to follow.

Mr. QUIN. The saving to the people of the United States from the development of this river and water power, as contemplated here by Mr. Ford, would offset all of the interest that the Government might be losing on such an investment, would it not?

Mr. WORTHINGTON. That would appear to be true.

Mr. QUIN. It occurs to me that Congress made a great mistake last February when we voted this down, and I believe that to turn down this Ford proposition would be the crime of the twentieth century, the way I feel about it.

Mr. FISHER. Mr. Worthington, I come from a section where there is a very lively interest in the development of Muscle Shoals. The city of Memphis is the only city of large size within 150 or 200 miles that is without water power. We have industrial need for power. I would like to know whether or not all the power which is to be developed from the Muscle Shoals development will be utilized by Mr. Ford at Muscle Shoals or is there a possibility of, say, a city like Memphis through proper agencies getting some of that water power for the development of its industries.

Mr. WORTHINGTON. Well, I could only give you my opinion. It would be just merely my opinion. You have heard what Mr. Mayo answered, I think, in his testimony on that subject. From what I know of Mr. Ford, I think if Memphis went to him they would get what they wanted in that respect, but that is a matter of opinion. It is quite difficult, if I might take the chance and say it, to settle all these multiplied questions of policy without knowing whether you have got anything to settle them on. It just does occur sometimes that there are so many questions asked that could be answered with assurance and with definiteness, if we had something to answer them on.

Mr. FISHER. You are very familiar with the investigations that have been made about the development of navigation on the Tennessee River. I will ask you whether or not those who have been promoting the development of the Tennessee River have met with any great success in getting appropriations heretofore from the Congress for that development.

Mr. WORTHINGTON. Not to my knowledge.

Mr. FISHER. I will ask you whether or not from your study of the territories which the Tennessee drains, there are great natural resources that would naturally go to river traffic rather than railroad traffic, such as marble, lumber, coal, and iron.

Mr. WORTHINGTON. Undoubtedly.

Mr. FISHER. Do you know of any other or quicker way that the navigation possibilities of the Tennessee River could be developed than by such a scheme as is offered by Mr. Ford?

Mr. WORTHINGTON. It is the only way you can do it. You can develop it on some other scheme, but there will not be much navigation.

Mr. FISHER. Our section of the country, as you know, is sadly in need of fertilization.

Mr. WORTHINGTON. Yes.

Mr. FISHER. From your study of Mr. Ford's outline, do you think the farmers in their belief in the possibilities offered by Mr. Ford have the right to expect and hope that cheap fertilizers can be and will be produced for them?

Mr. WORTHINGTON. I think so.

Mr. WRIGHT. Mr. Worthington, I believe you stated yesterday that you are not a paid employee of Mr. Ford.

Mr. WORTHINGTON. Oh, yes; I stated that yesterday.

Mr. WRIGHT. You are the president of the Tennessee River Improvement Association?

Mr. WORTHINGTON. Oh, no; I am the chairman of the executive committee.

Mr. WRIGHT. Will you tell the committee what the activities of that association are, and what are its objects and purposes.

Mr. WORTHINGTON. The association is quite an old one, perhaps 25 years, and it is an association like the Ohio River Association and in part like the Mississippi Valley Association, engaged in efforts to get the navigation obstructions of the Tennessee removed, but it is a little different in respect to its activities since 1915 or 1913, from some of them, because the association, I may say, put teeth in its work and paid for information, and dug it up and tried to keep it put. That is about the size of it.

Mr. WRIGHT. The point I am getting at is this, Colonel, would the development of this Muscle Shoals property, in accordance with an acceptance of Mr. Ford's proposition, be in line with the efforts and objects of your association.

Mr. WORTHINGTON. Oh, to be sure; that is the object.

Mr. WRIGHT. That will largely explain your connection with it and your activities in connection with it?

Mr. WORTHINGTON. Yes; it was thought we had to go somewhere very soon. There was going to be possibly a long wait, and as I said yesterday it was a question of capital, and we felt that Mr. Ford had it, and it turns out he has it, with which to do this job. It was nothing extraordinary; it seemed to me it was the most natural thing to do.

Mr. WRIGHT. Do you understand it is the purpose of Mr. Ford to give the consumers of fertilizers the benefit of this cheap power.

Mr. WORTHINGTON. Oh, yes. He says how he will do it, and he says he will not get more than 8 per cent profit.

Mr. WRIGHT. With the Gorgas plant contiguous to a coal supply, steam power could be generated there very economically, could it not?

Mr. WORTHINGTON. Yes; it could be generated economically; as far as the coal power could be generated, I think that is so.

Mr. WRIGHT. Then you think water power would be generated as cheaply there as anywhere else?

Mr. WORTHINGTON. I think they could get relatively cheap power.

Mr. WRIGHT. So he would have two sources of cheap power?

Mr. WORTHINGTON. But it is fair to Mr. Ford to say that his mind is not on steam power.

Mr. WRIGHT. That is an adjunct?

Mr. WORTHINGTON. Yes.

Mr. WRIGHT. Do you regard this enterprise as applying to this region alone, or as a national asset?

Mr. WORTHINGTON. I think it is national in its results, if the results expected mature.

Mr. STOLL. Mr. Worthington, if I understand your testimony correctly, is it your opinion that if Mr. Ford gets Muscle Shoals, there are certain definite developments we may expect, namely, the navigation of the Tennessee River, the manufacture of fertilizer, and the development of electric power. He will find that much a certainty?

Mr. WORTHINGTON. I do not think there is any doubt about that.

Mr. STOLL. Also, that there are certain probabilities, namely, that you would manufacture aluminum, and probably electrify certain railroads.

Mr. WORTHINGTON. Electric steel, perhaps.

Mr. STOLL. And third, that there are certain possibilities that are almost beyond the imagination of man?

Mr. WORTHINGTON. Congressman, I think you have stated and defined it perfectly; just as perfectly as you could state it.

Mr. GARRETT. Mr. Worthington, in your whole life did you ever appear before a more inquisitive body than this committee?

Mr. WORTHINGTON. I am still before the body, Congressman.

Mr. GARRETT. The question I want to ask you is, is there in your possession now, after this examination by all these gentlemen on the committee, any information that I could possibly elicit by any question I might think of? Have you told the whole story?

Mr. WORTHINGTON. Congressman, do you not think you are crowding me a little?

Mr. GARRETT. I do not want to rehash anything that has been gone over. I was wondering whether there was anything in your mind you want to say which you had not said.

Mr. WORTHINGTON. In frankness, I think the case is before the committee, and as I have stated before, if you will let Mr. Swann show you what nobody else in this country can better show you, I think you will have this case very well illustrated and well understood.

Of course, there are a great many things that might be said, but I do not see why—there are some very interesting phases of the case that might be discussed, but it would be entirely within the pleasure of this committee to say how long they would care to discuss them.

Mr. GARRETT. Sometimes a witness has something in his mind that has not been fully developed by interrogations and I was wondering if there was anything you would like to say further.

Mr. WORTHINGTON. That gives me an opportunity to say this. You know there was some little colloquy yesterday, quite friendly, I am sure, about what I call contact. My mind goes back to that somewhat, and I would like to say this: We who try to answer you have our difficulties; I am very sure we want to answer you in full, if possible. But there are some of the questions that absolutely must remain for the future; nobody can answer them now. I better understand, since I have been before the committee, your viewpoint, and I better appreciate some of the questions that were asked yesterday. I know very well you are entitled to every bit of information that can be given to you. There is this fact I hope you will, from the human standpoint, remember, that this negotiation has been on now since June 6 last, and I do not want to say to the committee that Mr. Ford is an impatient man—very much the contrary. But put yourself in his place, if you can, a very busy man, with a great many great big things to deal with, and then have to consider negotiations in connection with his offer after all these months. Just please appraise our difficulties in dealing with that kind of a case.

I wish especially to leave with the committee this thought. I think a great many people have been in error all the time. Please remember that Mr. Ford was invited; he did not seek this proposition. And then again, there is just one little thing further and that is this: I think Mr. Ford has shown a patience that is perfectly unusual. His offer came down here to the Secretary of War—do not understand that I am complaining about him at all, or making any statement that is unfriendly—but it is a fact that the Secretary of War gave out Mr. Ford's offer, or the text of it, to the public, and he still invited bids, and I understand the Secretary of War still expects them. Right there is a little case in which it seemed to me the letting out of an offer was not just according to Hoyle.

The CHAIRMAN. So far as this committee is concerned, they only received the letter of the Secretary of War forwarding this proposition to Congress about two weeks ago, and for 10 or 11 days we have been meeting, forenoons and afternoons, so that the committee has certainly not been guilty of delay.

Mr. WORTHINGTON. It must be made plain that I did not at all intimate that this committee has not been persistent in its work. What I am trying to get before the committee is this: When you remember that the news is continually coming out, that there is another offer coming in, and you find a man occasionally getting fretful when these changes are suggested, please remember our difficulties.

Mr. GARRETT. I understood you to say you were the gentleman who carried the proposal from the Government to Mr. Ford?

Mr. WORTHINGTON. Let that be made perfectly clear. The Chief of Engineers was asked to come to Detroit. He could not go, and he said that he would like to have me go, although, of course, he made it perfectly clear he could not give me any official status. I told him no official status was needed.

Mr. GARRETT. So far as Mr. Ford is concerned, as I understand from your testimony, the Government invited him to make a proposal concerning Muscle Shoals?

Mr. WORTHINGTON. He received the same invitations that the others did.

Mr. GARRETT. And he has made that proposition and you have now given the committee all of the information you have in connection with the whole matter, so far as Mr. Ford's viewpoint is concerned; and as far as I am concerned—

Mr. WORTHINGTON (Interposing). As far as I possibly could.

Mr. GARRETT. The matter, as far as I am concerned, I think I understand fairly well, and it is reasonably clear to me as a layman, except one proposition, and that is on the question of the amount of fertilizer that is going to be manufactured at this plant for distribution among the farmers. In reading section 14 of the proposal I drew the conclusion before the evidence was offered that what Mr. Ford intended to do, what that section provides that he shall do, is that he will maintain nitrate plant No. 2 for the manufacture of ammonium nitrate, or its equivalent in fertilizer compounds, to the amount of 110,000 tons of ammonium nitrate per year.

Mr. WORTHINGTON. That is true.

Mr. GARRETT. I understood that to mean that when you take that element as a component part of fertilizer, that the total number of tons of finished or concentrated fertilizer would be 110,000 tons of ammonium nitrate converted into nitrogen divided by the amount of nitrogen contained in one ton of the complete fertilizer. I want to know whether I have got that right or not?

Mr. WORTHINGTON. I think you have that just about right.

Mr. GARRETT. If that be true, according to the testimony of other witnesses, going upon the ordinary basis of 2-8-2 fertilizer, it would be equivalent to something like 2,000,000 tons per annum, as a minimum.

Mr. WORTHINGTON. That is right.

Mr. GARRETT. The question of the maximum would depend upon the demand of the country, and of course the amount of fertilizer—

Mr. WORTHINGTON (Interposing). I think the maximum would be determined by the cost per ton. If it is low, it will rise right up. And right there—I wish I could get the sympathy of the committee on one point. I thought about your troubles last night and tried to put myself in your place, and I would like to say this: Suppose you put yourself back at Niagara Falls, 10 or 20 years ago, and you were sitting there to determine whether you would furnish capital or not, and you had asked those people what the tonnage of production would be. Gentlemen, they could not have answered you at all, and that is just the case you have before you to-day.

Mr. GARRETT. That was my personal conclusion of the matter, and my construction of the contract was that section 14 was put in there as a notice, so far as the fertilizer feature of it was concerned, that here is a minimum: that we would have that capacity of ammonium nitrate going into the finished product. That would be the minimum. What else it will be, whether it will be 10,000,000 tons 10 years from now we do not pretend to state. But we do start with this minimum gross amount, and we state that it is a minimum. In comparing this with the total amount of fertilizer now produced there have been estimates as to whether this product will reduce the price of fertilizer.

Mr. WORTHINGTON. That is right.

The CHAIRMAN. Mr. Worthington, this matter of the fixation of nitrogen has been before Congress since about 1912, has it not?

Mr. WORTHINGTON. Yes, Mr. Chairman, I think that is right.

The CHAIRMAN. Were you not interested in bringing the matter to the attention of Congress at that time?

Mr. WORTHINGTON. Oh, yes; back in 1912, representing, in part, the Alabama Power Co. and the American Cyanamid Co., I did do my best to get a grant for the Alabama Power Co. to build what was known as Lock No. 13 at the dam on the Coosa River. I suppose that is what you refer to?

The CHAIRMAN. It is.

Mr. WORTHINGTON. That is true; and perhaps as you were a Member of Congress at that time you remember the grant was given, and that Mr. Taft, who was then President, found it necessary to veto it. That was a very sad thing. I do not know but that I am glad you mentioned it. It seems that we made, unluckily, so many mistakes about the fixation of nitrogen in this country that if it is possible we ought not to do it any more.

The CHAIRMAN. We did learn some things from our mistakes.

Mr. WORTHINGTON. Yes; and we ought surely try to get right on this thing at this time, if possible. That failed, Mr. Chairman, as I remember it, only because the Secretary of War at that time demanded that he be given the right to make a charge for the use of the water. Well, that could not be agreed to. The result was the cyanamid plant designed to be built at Montgomery, Ala., went to Canada, and the sad thing about the whole matter is that if the mistake had not been made the Government would have saved during the war, I am sure, not less than \$30,000,000, because you would have had an air nitrogen fixation plant, and, if you please, it would have used the very same process you have had at plant No. 2, and you gentlemen know you would have just expanded that. So it seems that we have been quite unlucky in this country on that subject.

I want to call Mr. Miller's attention to the fact that he has more water power in his State, perhaps, than in any State in the Union. I do not know how he feels about it, but as far as Alabama is concerned, I am unalterably opposed to any Secretary of War assessing a tax upon the use of water. I do not care who he is. He is too far away from the water power sites to decide that question; nine times out of ten he would be a lawyer, who does not know much about kilowatts. That is rather voluntary on my part, Mr. Chairman, but I hope it is not impertinent.

The CHAIRMAN. It is very instructive to the committee. I come, as you know, from the State of California, and the interference by Government officials with the development of water power has been more harmful than I would be able to tell in a few minutes.

Mr. WORTHINGTON. I do not think you could.

Mr. HULL. Mr. Worthington, we sometimes lose sight of what I think the committee considers the fundamental object of this entire matter, and that is the fixation of nitrogen for war purposes. This whole thing, fundamentally, is considered as a national defense problem, and nothing else. In the making of this contract with Mr. Ford, was there any question in regard to his being compelled, for the life of the contract, for the 100 years, to maintain plant No. 2 as a plant that would fix nitrogen for use in the manufacture of explosives?

Mr. WORTHINGTON. There is no question about that; he binds himself to keep the plant there, prepared to do that.

Mr. HULL. You refer to the provisions of paragraph (b) in section 14?

Mr. WORTHINGTON. Yes; that is right, Mr. Hull.

Mr. HULL. Maj. Burns, on page 215 of the testimony before the committee, rather doubts whether that is sufficient. Have you any doubt in regard to that?

Mr. WORTHINGTON. I think no one in the world would doubt it. I never heard the question raised before.

Mr. HULL. If there is any doubt about it, Mr. Ford would not be opposed to making it specific, I take it. It is not as specific as it might be; I will admit that; but I think the intent was to be specific. I think we can not reiterate it too many times, and it seems to me it is necessary that it should go into the contract, and that part of the contract must go into the deed; is that not true?

Mr. WORTHINGTON. I am sure you will not find—I do not think I will be mistaken about that—that Mr. Ford would be unwilling to do any reasonable thing. He, however, has shown some hesitation about continuing to make changes. He said this, that some time, somewhere, the negotiations had to come to an end.

Mr. HULL. That is the only point, making specific what he really intended to do.

Mr. WORTHINGTON. If you would kindly confer with Maj. Burns and draw up something that is right, and give it to Mr. Mayo, he will see about it. There is no hesitation or disposition not to try to do it.

Mr. HULL. I have not any doubt as to the intention; the only doubt I have is on this score, that if we do not clear it up now, 30 or 40 or 50 years from now somebody will be going around wondering what we did mean. So it seems to me we ought to make it very clear at this time, because I would not for one minute support this contract if that was not made positively clear.

Mr. WORTHINGTON. I may say that I am sorry Maj. Burns has found it necessary to tell you what you say, because he was, as I recall, present when the final draft was entered upon in the Judge Advocate General's office, and it is unfortunate he did not suggest the difficulty at that time.

Mr. PARKER. Mr. Worthington, you have mentioned the navigation plans on the Tennessee River. I do not think it has been stated what draft of boats is contemplated by those plans and by the locks.

Mr. WORTHINGTON. The improvement of the Tennessee River, Congressman, from Muscle Shoals to the Ohio River, provides for a 6-foot draft, and that is completed, a distance of 259 miles.

Mr. PARKER. Are there any locks?

Mr. WORTHINGTON. One lock.

Mr. PARKER. What is the length and breadth of the lock.

Mr. WORTHINGTON. The lock has a 26-foot lift, with a canal 8 miles behind it.

Mr. PARKER. What is the length of the lock?

Mr. WORTHINGTON. This lock is 80 by 287 feet.

Mr. PARKER. Are the same sort of locks contemplated at other places?

Mr. WORTHINGTON. That is the only one of that type. That is at Colbert Shoals.

Mr. PARKER. Above and at the dams what sized locks are contemplated?

Mr. WORTHINGTON. The only lock is at Hales Bar.

Mr. PARKER. At Dams 2 and 3.

Mr. WORTHINGTON. At Dams 1, 2, and 3 the latest information I have is that they are 60 by 300 feet. There are several lifts.

NOTE.—The report of the Chief of Engineers for 1920 (p. 1326) gives the dimensions of the locks planned at Dam No. 2 as stated above. It is understood, however, that these locks are to be at least as large as any on the Tennessee River, and it is expected that suitably enlarged dimensions will be adopted when construction work is resumed.

Mr. PARKER. I only want to get the draft.

Mr. WORTHINGTON. It is 6 feet, and can be made 9 feet whenever necessary.

Mr. PARKER. What is the draft at Hales Bar?

Mr. WORTHINGTON. Six feet.

Mr. PARKER. So it is a 6-foot draft?

Mr. WORTHINGTON. That is the plan, with a possible rise to 9 feet.

Mr. PARKER. That would provide for a boat of pretty good size?

Mr. WORTHINGTON. Yes; that would be very good.

Mr. McKENZIE. Mr. Worthington, you are familiar with this subject from its very inception, I take it?

Mr. WORTHINGTON. Yes, sir; that is so, Mr. McKenzie. I guess.

Mr. McKENZIE. In 1912, when you succeeded in getting the act passed by Congress for the development of Muscle Shoals or on the Tennessee River—

Mr. WORTHINGTON (interposing). On the Coosa River.

Mr. McKENZIE. There were two interested parties, I assume, at that time?

Mr. WORTHINGTON. There were.

Mr. McKENZIE. One was the American Cyanamid Co., and the other—

Mr. WORTHINGTON (interposing). The Alabama Power Co.

Mr. McKENZIE. And at that time, of course, the world was at peace; the European war had not broken out at that time.

Mr. WORTHINGTON. Yes, sir; that is quite true.

Mr. McKENZIE. And the question of the construction of this particular plant was not predicated upon the manufacture of nitrates for military purposes?

Mr. WORTHINGTON. I think that is true; the military side of it, or the preparedness side, was not pressed at that time.

Mr. McKENZIE. At that time the agricultural interests of the country were the people who were really interested, outside of the American Cyanamid Co., which expected to manufacture different products, and the Alabama Power Co., which would have taken some of the power.

Mr. WORTHINGTON. Yes.

Mr. McKENZIE. That law, you said, was vetoed by President Taft?

Mr. WORTHINGTON. But I do not want to say I criticized him, because I got in perfect good humor with him after he talked to me about it.

Mr. McKENZIE. In 1916 you came back to Congress and, as I remember, being a member of the Committee on Military Affairs at that time, the original proposition was to have this plant constructed at Muscle Shoals.

Mr. WORTHINGTON. Well; we did present to your committee in 1916 the suggestion or plan that you prepare for the national defense of the country in the matter of nitrates, and at that point; that is right.

Mr. McKENZIE. That is my recollection. Some of us opposed it at that time on account of the fact that the Alabama Power Co. either owned or had options on the flowage rights where dam No. 2 is constructed; in fact, were entrenched at that particular place.

Mr. WORTHINGTON. That is a fact.

Mr. McKENZIE. To some of us it looked as though it might be a proposition to enable the Alabama Power Co. to make a profit, which, of course, Members of Congress are always suspicious of in a proposition of that kind.

Mr. WORTHINGTON. That is true.

Mr. McKENZIE. Finally, after a long discussion, section 124 of the national defense act was agreed upon and enacted into law, and received the approval of the President.

Mr. WORTHINGTON. That is true.

Mr. McKENZIE. Now, at that time our country was at peace.

Mr. WORTHINGTON. It was.

Mr. McKENZIE. But the two principal things placed before us at that time were, first, the emphasis of the necessity of having nitrates for the manufacture of munitions, and secondarily to have a plant so constructed that in time of peace it could be utilized for the manufacture of one of the elements that go into the manufacture of fertilizer.

Mr. WORTHINGTON. That is the history of the case.

Mr. McKENZIE. In my judgment, had it depended upon either one of those propositions alone, section 124 would never have passed Congress; but when the two elements were combined there were enough votes to pass the bill.

Mr. WORTHINGTON. That is my judgment, too.

Mr. McKENZIE. Section 124 of the national defense act provides that the President shall investigate, and according to his judgment determine the best and cheapest and most available means of the production of nitrate and other products for the munitions of war, and useful in the manufacture of fertilizer. In other words, the proposition was to produce nitrates or other products useful in the manufacture of fertilizer.

Then, going on down through the section it provides that he shall have power to lease, purchase, by condemnation or otherwise, certain property and construct buildings, and so forth, for the manufacture of such products which can be used in the manufacture of munitions and also be useful in the production of fertilizer.

Mr. WORTHINGTON. That is right.

Mr. McKENZIE. Then further down in the section there was a paragraph thrown in which says that the plant provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital.

Mr. WORTHINGTON. That is right.

Mr. McKENZIE. That was put in, you well remember, in order to confine the activities of the Government to governmental operations.

Mr. WORTHINGTON. That is absolutely true.

Mr. McKENZIE. My recollection is that I voted against the bill, not believing in Government operation. Was there anything done under section 124 for a number of years?

Mr. WORTHINGTON. In 1917, there being an apparent danger that the United States would go to war, investigations by the Ordnance Department were made; and finally, you will remember, the President did send out a Cabinet commission of three to look over the country, and they visited certain States. Then, finally, if you remember, there were a number of commissions—at least two, perhaps—that were investigating to find out what processes to use, with the final result that they decided to adopt this modified Haber process, owned by the General Chemical Co. Then—I think it was in 1917, in the fall of 1917—the question of the location came up, and plant No. 1 was located in the western part of Sheffield, Ala. A little while after that some ordnance officers of the English Government, as I understand it, came over here and suggested to our ordnance officers the grave danger of the situation, and there was a rush made to go further, and then came plant No. 2. Then, as you know, they went on and had under construction two more plants, each one half the size, in capacity, of plant No. 2. Those other plants were located near Cincinnati and at Toledo, Ohio. That is, roughly, the history of the matter.

Mr. McKENZIE. You understand I am not criticizing the location of the plant at Muscle Shoals?

Mr. WORTHINGTON. No; I do not so understand your question.

Mr. McKENZIE. Because I believe if there is any place in the world where the Government could possibly manufacture fertilizer and compete with private enterprise it might possibly be at Muscle Shoals.

Mr. WORTHINGTON. I think you are correct about that.

Mr. McKENZIE. But I have never been convinced of that fact; and our friend from Mississippi, Mr. Quin, may have properly stated for the hearing, it seems to me, when telling of his sorrow at the defeat of the appropriation last February, that it was defeated, not because Congress does not approve of the manufacture of fertilizer for use by the farmers, but it was defeated because of the fact that the majority of Congress believed that the Government can not enter upon this enterprise at Muscle Shoals or any other place and produce fertilizer at a price that will enable the Government to compete with the private manufacturers of this product, except at a loss; or, in other words, subsidizing the plant.

Mr. WORTHINGTON. I think that is a fair statement. I do not feel that Mr. Quin could be any sorer than I was at the defeat of the appropriation. But I rather think now, the way the matter is headed, that it was a good thing.

Mr. McKENZIE. I want to say to the gentleman that I think it was one of the wisest things Congress has done since I have been a Member of it. The enormous waste and extravagance that has been carried on down there demonstrated the utter futility of the Government undertaking to operate this plant to advantage for the farmers or anyone else; and, in view of the fact that we had 300,000 tons of nitrate in reserve on hand to take care of the needs of the War Department, we could not see that it was a wise thing for the Government to proceed with the expenditure of this money until some plan had been adopted, some way had been found whereby this power could be utilized to the advantage of the people of this country without loss to the Government of the United States. Therefore it was defeated.

Mr. WORTHINGTON. That is right.

Mr. McKENZIE. And it was the intention of many of us at least to continue to defeat such proposals until the Secretary of War or the administration could bring about some solution that would enable this development to go on and bring about the results desired by the farmers of this country, and at the same time protect the Ordnance Department in the supply of nitrates. Because of that we held the thing up. I think it was generally known to the men who were doing things in this Government, and out of that grew the proposal of Mr. Henry Ford. He has come forward as one of the men of this country offering to take over this plant on certain conditions. And I will say he has approached the solution of what I believe to be one of the most momentous questions before this country. I think there are great possibilities in it. I have never decried it except that I think it would be folly for the Government to undertake to operate it, but I am in favor of any proposition, whether it is Mr. Ford's or some one else's, whereby somebody will come in and give to the Government a sufficient guaranty that the purpose of the project will be carried out in good faith, and that the Government will be relieved of the responsibility of undertaking to furnish the requirements of this country in a necessary product, on which they would have to pay a subsidy to enable them to sell it to the farmer at anything like a fair price.

In the course of the testimony which has been given to the committee my friend Mr. Miller has criticized, or has brought out the fact that in his opinion the Government is supposed to forever maintain this plant No. 2 to protect it in the supply of nitrate. I do not understand that this proposition in any way affects that. Mr. Ford agrees to keep it in good condition and in operation for 100 years. At the end of the 100 years the plant reverts to the Government, and we still have it, unless we desire to make some other regulation in connection with it.

Mr. WORTHINGTON. And be subject to your call.

Mr. McKENZIE. Absolutely.

Mr. WORTHINGTON. That is entirely true.

Mr. McKENZIE. But I want to ask you this question, as a business proposition: Do you not feel that in a proposition involving so much that there should be a provision in the contract providing that should Mr. Ford, his heirs or assigns, or the corporation which he will afterwards bring into existence,

or its successors, fail to carry out the conditions of the contract for the protection of the Government, that a forfeiture should take place? In other words, it is too big a proposition to provide merely for an indemnity of \$200,000 or \$500,000. If he is in good faith, it seems to me, knowing him as a business man, not personally, that he would not object to that sort of a proposition for the protection of the Government.

Mr. WORTHINGTON. I thought more than once about your question because you know it has been a subject of discussion. On first consideration I believe your viewpoint, as I think you have correctly stated it, is right. But on second consideration, if you will please look at section 18 you will understand what I mean. If Mr. Ford fails, does not comply with the terms of the contract, or in the event of the violation of any—if you please—any of the terms of this proposition or any contract made in furtherance of its terms, the company agrees that the Attorney General may, upon the request of the Secretary of War, institute proceedings in equity in the district court of the United States for the Northern District of Alabama for the purpose of canceling and terminating the lease. Right there let me say if such a thing happens every dollar that Mr. Ford puts at Muscle Shoals is gone. After carefully considering that clause, trying to answer you as a businessman, you having made a business inquiry, I do not think that it will do any good or improve the situation or further clench the security or make you safer to adopt your suggestion, because if the whole thing was to go to pot and fail a mere forfeiture can not be a cure for the thing at all. That is my viewpoint after considering it very fully.

Mr. McKENZIE. According to your testimony and the testimony of others, the Government would not be justified in spending this large amount of money, so far as the navigation of the Tennessee River is concerned; that is your viewpoint?

Mr. WORTHINGTON. Yes.

Mr. McKENZIE. Having in mind the very large reserve of nitrates we have on hand at present, and the possibilities of acquiring additional nitrates in other ways, is it your judgment that the Government of the United States at this time would be justified in considering this an emergency that would warrant us in appropriating money simply to take care of the nitrate end of the situation for war explosives?

Mr. WORTHINGTON. If you had not expended on the dam the amount you have expended I would not be able to support the proposition. But you having, however, expended the amount you have on the dam, I have never seen any way out of it except to do what is proposed. That is my position.

Mr. McKENZIE. You qualified that to some extent. To my mind there is no such emergency that would justify us in spending \$50,000,000 immediately to acquire a larger supply of nitrates just at this time.

Mr. WORTHINGTON. Not simply for explosive purposes.

Mr. McKENZIE. Coming back to the other proposition, those two things being true, then the only justification for the expenditure, either by the Government or under Government operation or leasing the property to Mr. Ford or someone else, rests on the fact that in this country, according to the statements of the leading agriculturists of our country, there is an emergency, so far as fertilizer is concerned.

Mr. WORTHINGTON. That is true.

Mr. McKENZIE. And that it is essential and necessary that something be done, and on that you base your claim for this action at this time.

Let me ask you another question. Of course, we all agree that there is a very great potential water power at that point. In case the Government should build the dam and the powerhouse, acting on the theory that it could be sold or leased, do you believe, or is it your judgment on that as a man of long experience in business, that Mr. Ford's company or any other company or individual would be justified in the expenditure of the vast sum of money that would be necessary to erect a plant at Muscle Shoals and utilize this power, that would be justified under a lease of 50 years?

Mr. WORTHINGTON. Indeed I do not.

Mr. McKENZIE. Do you express it as your judgment that it is doubtful at least that the Government could find a lessee that would take the property over on any such conditions?

Mr. WORTHINGTON. I do not think you can, if you require that lessee of the power to carry out your intentions in reference to fertilizer. You might pos-

sibly get somebody, not including Dam No. 3, to complete Dam No. 2; you might possibly get somebody to agree to 50 years, but I do not think so. I do say that I think it would be a very unbusinesslike proposition.

Mr. McKENZIE. Are you willing to state that it is your judgment that under the Ford proposition the Government will be selling him power at a very reasonable rate, if not a low rate; in other words, if he undertook to construct the dam and create the power himself and operate it, it would cost him a great deal more than the \$2,000,000 which has been estimated as the amount of 4 per cent interest or rental he would have to pay?

In other words, looking at it from a cold, business standpoint, is it not true that the Government would be giving to Mr. Ford at least charitable consideration on that point?

Mr. WORTHINGTON. Would you not be willing to substitute the word "favorable" for "charitable?"

Mr. McKENZIE. Yes.

Mr. WORTHINGTON. While, it is undoubtedly true; and if I may follow that just a bit, let me say that the Government, under the circumstances, in view of the Government's investment down there, has made a good trade to do it, with the understanding, and I am sure certainly with the belief that you are going to see some satisfactory results in obtaining low costs with cheap power.

Mr. McKENZIE. After all, getting right down to brass tacks, Mr. Worthington, is there not involved in this proposition, after we do develop it, from every standpoint, that the Government is going to be the loser, in a sense, financially, just figuring in the matter of dollars, but in the hope that all the conditions coupled up with it, in view of the potential elements and benefit that it is going to be to agriculture, you feel, and that is the feeling of the men behind you, representing the agriculturists down in that country and all over the United States, that it will be worth the price?

Mr. WORTHINGTON. I very positively tell you I do feel that way.

Mr. McKENZIE. And in view of the many other expenditures that our Government has made, upon which we have never received any return—

Mr. WORTHINGTON (Interposing). And never will—

Mr. McKENZIE. I want to say to you very frankly, Mr. Worthington, that if Mr. Ford or some one else has the genius to unscramble this proposition, I think I should be very glad to favor some proposition to enable the Government, not, I would say, to unload this proposition, but to put it into the hands of some one so that it can be operated successfully and without loss to the Government.

Mr. WORTHINGTON. Put it to work.

Mr. McKENZIE. That is it.

Mr. MILLER. Mr. Worthington, did you get the idea from my questions yesterday that I favored a kilowatt tax?

Mr. WORTHINGTON. Oh, no.

Mr. MILLER. I understood you to intimate that I did.

Mr. WORTHINGTON. Oh, no; I am very sure you do not, coming from your State.

The CHAIRMAN. We are very much obliged to you for the very enlightening information you have given us.

(Thereupon the committee took a recess until 2 o'clock p. m.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Friday, February 17, 1922.

STATEMENT OF MR. HUGH L. COOPER, OF STAMFORD, CONN.

The CHAIRMAN. Mr. Cooper, will you state your name in full, your present occupation, and some of the big engineering works that you have been connected with?

Mr. COOPER. My name is Hugh L. Cooper, and my residence is Stamford, Conn., and I have been a consulting engineer for about 20 years, and in the practice of hydraulic engineering for about 30 years. I have built several water powers in different parts of the world. One of them was at Niagara Falls and one was at Keokuk, Iowa, and one at McCalls Ferry, Pa., one in Brazil, one in Chile, several in Canada, and, I think, the aggregate of them all is something in excess of 1,000,000 horsepower, not including the Muscle Shoals work, where I am the consulting engineer for the Government. I would like to say I got into this dam job very peculiarly.

The CHAIRMAN. I did not quite catch that?

Mr. COOPER. I want to say that I got into this dam job, it is a damn job, and I mean just that, in a very peculiar way. It was not from my seeking. I have been hearing about the Muscle Shoals job for 15 years, and about every time anybody wanted to do anything in the last 15 years the Muscle Shoals job has been in the road. It was in the road in Congress. It was called a job. I do not think it ever was a job in the sense some of its maligners called it; at the same time it was used to defeat a great deal of good legislation in the aid of water power; and, as far as I am personally concerned, I would be very glad if something could happen out of this investigation that would speed the day when it is done, finished, and we get rid of it.

When I was in the service in France I was ordered home by somebody; I do not know who it was; I suppose it was the Secretary of War, to build this job, and, of course, that was very disagreeable news to me. On arrival I went to work as hard as I could and started the work and redesigned it, and it was about two months under way when I got ordered back to France. I never knew exactly how that happened, except I knew it meant a lot of hard work after I got over there. Then, when I came home, I found that the Chief of Engineers had been changed and that the new Chief of Engineers said that in view of the fact they were following plans which I had recommended when I was in the service, he thought that I owed it to the Government to keep right on, on a Government basis, and do this work for nothing, and I have been fool enough to do it up to this time.

I do not say that in any spirit of disrespect to anybody, but I do say that it is a little strange, in my experience at least, to be the designer and responsible for the execution of plans for forty or fifty million dollars of work for \$1 a year, after the armistice is signed, and that is another reason I would like to see somebody hurry up and get this dam done.

The CHAIRMAN. Mr. Cooper, I want to congratulate you on the fact that you have been willing to serve your country without sticking your hands into the Treasury and trying to pull out a big plum.

Mr. COOPER. Thank you very much.

Now, I have a very definite sympathy for the committees in Congress that have to listen to testimony, especially testimony from engineers. As a rule, they do not know what they are trying to say very well, and the second thing is they do not very well know how to say that which they do know, and realizing that this committee is pretty well tired out and also because of the

fact that I have only been investigating this Ford proposal for about three days, I naturally have not a great deal to say about it, but I have prepared four or five statements, and I think perhaps it would facilitate and hasten this investigation or my testimony, at least, if I would pass this around to you gentlemen, and then they can ask their questions and we will get through a lot quicker and we will not have near as much trouble about wandering testimony.

The CHAIRMAN. Would it take very long to read the statement?

Mr. COOPER. No; they are reasonably short.

The CHAIRMAN. I think probably the better way would be to read it and let the members digest it, as you read it, and then ask you questions about it.

Mr. COOPER. Before entering upon these particular statements, I wish to make very emphatic one thing, and that is I am not here in advocacy of Mr. Ford's proposal or anybody else's proposal, or against anybody's proposal, Mr. Ford's included. As I take the chairman's telegram to me, what he wanted me to do was to come down here and tell what few facts I could about Mr. Ford's proposal as submitted, and then to answer as best I can such questions as you may desire to ask me.

In looking over the Ford proposition, based upon my knowledge of the extent of the work and the cost of it, and the terms of the proposed payments for the use of it, as contained in the Ford proposition, the first thing that astounded me was the difference between the amount of money that the United States Treasury was going to pay out and the amount that they would get back during the lease period.

Now, my statement No. 1, which is an analysis of the final statement on page 3, shows, if my figures are correct and I think you will find they are, that the expenditures of the Ford proposition as written will cost the Treasury of the United States \$1,275,000,000. That is an absolutely flat fact. I am referring now only to the power question. It has nothing to do with the nitrate plants at all.

On page 2 you will note that there is a statement of the estimated cost of the dams Nos. 2 and 3, amounting to \$83,175,475. That is the cost at the time Mr. Ford agrees to pay 4 per cent return on what turns out to be \$50,000,000. His proposition, as interpreted by me, and as confirmed by statements from the War Department engineers, showed he is going to pay into the Treasury 4 per cent on about \$50,000,000, which is \$2,000,000 a year.

In arriving at this rather startling sum of \$1,275,000,000 I have taken the total, as you see, specified as \$83,175,475, and compounded it annually at 4 per cent for a balance of the lease period. I use 4 per cent because that is the per cent used in Mr. Ford's document. It is believed by most men I hear talk that that is a fair rate of interest to consider for public funds. When the cost is \$83,175,475 to the Treasury, Mr. Ford begins to pay into the Treasury \$2,000,000 a year. If the Treasury invests that \$2,000,000, which I believe they could do, at 4 per cent, at the end of the lease period the money produced by the 4 per cent on the \$2,000,000 payments would be \$1,275,000,000 less than the cost to the Treasury of the \$83,175,000 during the lease period. That is all I have to say about that statement. If anyone cares to question me about that statement, I think now would be a good time to do it.

The CHAIRMAN. I think, for the benefit of the record, you ought to put into the record the detailed statement you have given to members of the committee.

Mr. COOPER. I will be glad to have that go into the record.

(The statement referred to is as follows:)

PROPOSED FORD CONTRACT FOR MUSCLE SHOALS POWER.

STATEMENT NO. 1.—RE DIFFERENCE BETWEEN MR. FORD'S LEASE PAYMENTS TO THE UNITED STATES TREASURY AND THE AMOUNT THE TREASURY WILL HAVE TO PAY OUT IF MR. FORD'S PROPOSAL IS ACCEPTED AS WRITTEN.

1. In what follows, 4 per cent interest is assumed to be the best interest rate the Treasury of the United States can avail itself of during the next 100-year period, and it is to be noted that this 4 per cent rate is the base rate of all the calculations in Mr. Ford's proposal, and therefore this assumption can not be criticized as inharmonious with the letter and spirit of the Ford contract now before Congress.

2. I find that at the time Mr. Ford will begin the payment of a full 4 per cent interest return to the Treasury of the United States the sums expended

by the United States Government up to this 4 per cent payment basis, as estimated by the Chief of Engineers, will be as follows:

For completion of Dams Nos. 2 and 3-----	\$50,000,000
Interest accrued during the construction prior to the beginning of the 4 per cent interest payments less interim interest payments made by Mr. Ford (War Department estimate)-----	13,844,475
Previously spent on Dam No. 2 (War Department estimate)-----	17,000,000
Cost of flowage rights for Dam No. 3 (War Department estimate)-----	2,331,000
Total -----	83,175,475

3. For the purposes of a fair and parallel comparison I have assumed, in order to get a correct figure representing the loss to the Treasury in dollars, in this transaction, that the Treasury cost of the above total of \$83,175,475 at the rate of 4 per cent interest would be compounded annually for the lease period, thus producing a grand total of \$3,304,095,000 demand on the Treasury.

4. Investing the \$2,000,000 Mr. Ford proposes to pay into the Federal Treasury annually, which is 4 per cent of the estimated cost to complete the job, which estimated cost (United States Engineers' Department estimate) to complete is \$50,000,000. Such a plan would return to the United States Treasury at the end of the lease period \$1,979,185,000.

5. This, you will note, results in a grand total deficit (excluding the amortization payments in paragraph 10 of the Ford contract) to the Treasury of \$1,324,910,000.

6. Mr. Ford's amortization payments, in paragraph 10 of his contract, are planned to amortize \$50,000,000 of the above deficit, leaving a net deficit for the Treasury to provide for of \$1,275,000,000.

STATEMENT NO. 2.—BE AMOUNT OF LOW-TENSION HYDROELECTRIC ENERGY DELIVERED TO GENERATOR STATION BUS BARS THAT WILL BE CREATED BY THE COMPLETION OF DAMS NOS. 2 AND 3 ACCORDING TO THE REQUIREMENTS OF MR. FORD'S PROPOSAL.

A kilowatt is $1\frac{1}{2}$ horsepower.

A horsepower is three-fourths of a kilowatt.

Primary power is power that is available 365 days per year.

Secondary power is power that is available for some fraction of 365 days per year.

The secondary power, mentioned below, will be available from a minimum of 4 months per annum to $11\frac{1}{2}$ months per annum.

1. When projects Nos. 2 and 3 are completed, and, making no allowance for the value of important storage reservoirs in the Tennessee River above Dams Nos. 2 and 3, that future public interest will require to be constructed, the capacity to be installed in projects Nos. 2 and 3 (No. 2, 600,000 horsepower; and No. 3, 250,000 horsepower) will produce an average annual kilowatt delivery to generator station bus bars as follows:

	Kilowatt hours.	
	Primary.	Secondary.
Dam No. 2.....	700,000,000	1,490,000,000
Dam No. 3.....	285,500,000	608,000,000
Total	985,500,000	2,098,000,000

2. The total annual energy (primary and secondary) supply from both stations will, therefore, be 3,083,500,000 kilowatt hours.

3. The average cost to Mr. Ford of the total energy in paragraph 2 is (see statement No. 3) \$3.622,246 annually, or at a rate of 1.18 mills per kilowatt hour, a cost far lower (about 50 per cent) than can be arranged for elsewhere on the American continent.

4. In average generator station practice in the American hydroelectric field secondary kilowatt hours are figured at about 50 per cent of the value of primary kilowatt hours.

5. On the basis of the relative values specified in paragraph 4, the costs to Mr. Ford for primary and secondary power become as follows:

985,000,000 kilowatt hours, at 1.81 mills.....	\$1,782,850
2,098,000,000 kilowatt hours, at 0.905 mill.....	1,898,680
Total	3,681,530

Mr. Ford's annual payment for the foregoing energy (par. 3) is slightly less than the above grand total, and therefore the use of the unit costs of 1.81 mills and 0.905 mill, respectively, for primary and secondary power is conservative.

It will be interesting to show now what the gross annual cost of \$3,622,246, as shown in statement No. 3, applied to the energy produced from Dams Nos. 2 and 3, as shown by statement No. 2, will yield as to costs per horsepower per annum for the various classes of power. Assuming 8,000 hours' annual use for 24-hour power and 5,256 hours' annual use for the best annual load factor (about 60 per cent) that can be built up in commercial work in the territory reachable from Muscle Shoals shows the following horsepower net costs to Mr. Ford:

(a) For 24-hour power annual cost, $8,000 \text{ hours} \times 1.81 \text{ mills} \times 0.746 =$ (primary power), \$10.80 per horsepower.

(b) For 60 per cent load factor power annual cost, $5,256 \text{ hours} \times 1.81 \text{ mills} \times 0.746 =$ (primary power), \$7.10 per horsepower.

(c) For 24-hour power annual cost $\frac{0.905}{1.81} \times 10.80 =$ (secondary power), \$5.40 per horsepower.

(d) The total energy of 3,083,500,000 kilowatt hours, specified in paragraph 2, is equivalent to an average of 517,000 horsepower used 8,000 hours per annum. This 517,000 horsepower will cost Mr. Ford \$3,622,246 per annum, or at the rate of \$7.01 per horsepower, a price considerably less than one-half of what similar power can be secured for elsewhere on the American continent.

NOTE.—The foregoing amounts of energy were computed for a capacity of 550,000 horsepower for Dam No. 2. These energy amounts have not here been increased to correspond to the 600,000 horsepower capacity called for at Dam No. 2 in the Ford proposal. This omission will amply provide for the capacity needed to develop a 60 per cent load factor for primary power as above used.

7. The horsepower costs to Mr. Ford, as specified in paragraph 6, are approximately half the same costs at Keokuk and at Niagara Falls, on either side of the international boundary, and similarly are less than half the costs of the same class of energy in the commercial power territory reachable from Muscle Shoals.

8. It is apparent, therefore, that the Ford proposal calls on the Federal Treasury for \$1,275,000,000 during the next 100 years in order that Mr. Ford may secure sole unregulated possession of the greatest water power the South has and at a cost to Mr. Ford around one-half of what similar power is available for elsewhere on the American Continent.

STATEMENT NO. 3.—RE OPERATION AND MAINTENANCE OF MUSCLE SHOALS WATER POWERS.

1. I estimate the annual cost to Mr. Ford to operate and maintain Muscle Shoals Dams Nos. 2 and 3, up to and including low-tension bus bars, will be:

Operation, 850,000 horsepower, at 60 cents per horsepower year..... \$510,000

Repairs and maintenance:

For Dam No. 2 (specified in contract)..... \$35,000

For Dam No. 3 (specified in contract)..... 20,000

55,000

Renewals:

Machinery in power house—

For Dam No. 2, to replace 18 units every 30 years, costing \$16 per horsepower installed, calls for an annual sinking fund, bearing 4 per cent interest, compounded annually, of..... 155,000

For Dam No. 3, to likewise replace units in this plant, requires..... 65,000

220,000

Renewals—Continued.

Buildings, etc.—

For Dam No. 2, replacement of power house, auxiliary buildings, intake gates, screens, etc., annual charge-----	18,000	
For Dam No. 3, for similar replacement-----	7,500	
		25,000

Rental:

For Dam No. 2, 4 per cent on estimated cost to complete for 600,000 horsepower capacity, \$27,000,000----	1,080,000	
For Dam No. 3, 4 per cent on estimated cost for 250,000 horsepower capacity plant, \$23,000,000-----	920,000	
		2,000,000

(The above total of \$50,000,000 is the amount estimated by the Chief of Engineers as necessary to complete Dams Nos. 2 and 3.)

Taxes, \$50,000 horsepower, at 90 cents per horsepower year-----	765,000	
(This charge includes local and State taxes only, as Mr. Ford's proposal, as written, excludes Federal Power Commission jurisdiction.)		

Annual amortization payment called for in paragraph 10 of Ford proposed contract-----	46,746	
---	--------	--

Total yearly operating expenses after Dams Nos. 2 and 3 are completed-----	3,622,246	
--	-----------	--

STATEMENT NO. 4.—RE SHOWING IF 4 PER CENT INTEREST IS PAID BY MR. FORD ON TOTAL COST OF DAMS NOS. 2 AND 3, AND PAYS \$79,432 ANNUALLY TO AMORTIZE \$83,175,475, WHICH IS THE ABOVE TOTAL COST.

If Mr. Ford should amend his offer to pay 4 per cent on the total cost of Dams Nos. 2 and 3 (see statement No. 3, pp. 8, 9), his gross annual cost of power would be as follows:

(1) 4 per cent interest on \$83,175,475-----	\$3,327,019	
(2) Add operation charges (as per statement No. 3, on pp. 8, 9), \$3,622,246, less \$2,000,000 interest charges-----	1,622,246	
(3) Add to complete the amortization of \$83,175,475, not included in item (2) above-----	32,686	
Total annual cost for power-----	4,981,951	

On the basis of the above annual cost of \$4,981,951 applying to an annual production of 3,083,500,000 kilowatt hours, the kilowatt hour cost becomes 1.62 mills.

For primary power used 8,000 hours yearly, Mr. Ford's annual cost would be----- \$14.83 | |

For 60 per cent load factor (general commercial power) primary power, Mr. Ford's annual cost would be----- 9.75 | |

For 24-hour secondary power, Mr. Ford's annual cost would be at the rate of----- 7.41 | |

The total energy created of 3,083,500,000 kilowatt hours is equivalent to an average of 517,000 horsepower used 8,000 hours per annum; this 517,000 horsepower will cost Mr. Ford----- 9.64 | |

All of the above costs per horsepower are at least 20 per cent lower than present costs for the same classes of power elsewhere in the South or at Keokuk or Niagara Falls.

NOTE.—The use of 8,000 hours annually is here assumed for primary power, because 8,000 hours is about the average annual use when deductions for normal shutdowns and repair requirements are allowed for.

The above plan of paying 4 per cent on total costs would fully amortize the total costs of Dams Nos. 2 and 3 at the end of the lease period, and would save the Treasury of the United States during the lease period \$1,275,000,000, equivalent to an average annual saving of over \$13,500,000.

The CHAIRMAN. You say that according to Mr. Ford's agreement, or according to his statement, he will begin to pay \$2,000,000 a year on Dams Nos. 2

and 3, and that the aggregate cost of the completion of the dams will be about \$83,175,475.

Mr. COOPER. Yes. But he only pays on the cost of the new money required to complete Dams Nos 2 and 3, which is estimated by the War Department to be \$50,000,000.

The CHAIRMAN. Where do you get the figure that you also refer to as the probable cost to the Government of these dams, namely, about \$1,000,000,000?

Mr. COOPER. The cost of the dams is \$50,000,000.

The CHAIRMAN. Where do you get the figure of \$1,000,000,000 you were speaking of?

Mr. COOPER. I assume the Government would have to borrow the \$83,000,000, because it has not got it, and that it will have to keep on borrowing to pay the interest on the \$83,000,000. In other words, you compound it at 4 per cent interest. The \$83,000,000 is the total amount that is invested in this enterprise; and I have compounded the interest exactly the way we would do in private business. Incidentally, I would like to say that it is my humble opinion that the Government of the United States at all times should consider the cost of interest just as much as they consider the principal, and thus find out more correctly the extent of the Government's commitments in these big enterprises. Taxes for interest and principal come out of the same set of pockets.

The CHAIRMAN. This morning evidence was adduced before the committee to the effect that we have a great deal of river and harbor work every year in the different sections of the country, and no interest is ever charged on that work.

Mr. COOPER. That is a matter of policy for the Congress to decide. This is power business, and it is quite different. We are paying the money out, and the taxpayers are paying the interest as well as the principal.

The CHAIRMAN. You think this money can not be raised in any other way than through a bond issue?

Mr. COOPER. I am not enough of a financier to say that, but I notice that is about the way you are doing right along.

The CHAIRMAN. It has been contended by some members of the committee that this money could be raised by the ordinary process of levying taxes. That would not require the payment of any interest, and that is the way most of the river and harbor work is done.

Mr. COOPER. You are all the time paying it because you are all the time borrowing. It does not make any difference what you call your borrowing, you are continually paying out interest on coupons, and that fixes the price of money. If you did not spend this \$83,000,000 on this enterprise you could take up and retire \$83,000,000 worth of bonds, and save the payment of 4 per cent interest on that amount. So I think it is conservative to here use 4 per cent in calculating the cost to the United States Treasury of Mr. Ford's proposal.

Mr. WURZBACH. Would you not take into consideration the amount of money the Government already has invested in Dam No. 2, and figure the 4 per cent interest on approximately \$16,000,000? I think we have that much invested.

Mr. COOPER. Yes.

Mr. WURZBACH. And compound the interest at 4 per cent on that sum for 100 years, and would you not eat up that amount from the \$1,275,000,000?

Mr. COOPER. No; this \$16,000,000 is already spent and you are now paying more than 4 per cent on this loan. The deficit to the Treasury at the end of the lease period will be the figure set down in statement No. 1; that is, \$1,275,000,000. There is nothing theoretical about it; it is a practical fact.

Mr. QUIN. Mr. Cooper, where do you get the other \$33,000,000 from? You state it will cost about \$50,000,000 for the dams, according to the Army engineers.

Mr. COOPER. To finish them.

Mr. QUIN. Where does the other \$33,000,000 come from?

Mr. COOPER. On the top of page 2 is the statement of how that is made up. Do you want me to read that to you?

Mr. QUIN. Yes, sir; I wish you would.

Mr. COOPER. First, we have the interest accrued during the construction prior to the beginning of the 4 per cent interest payments, less the interim interest payments made by Mr. Ford, according to the War Department estimate. That amounts to \$13,844,475, and that is interest at 4 per cent on the expenditures up to the time Mr. Ford begins to pay his 4 per cent. You may remember in his proposition he proposes to make six annual payments of \$200,000 a year on one dam, and three annual payments of \$160,000 a year on the other dam. After they are deducted there is left this \$13,844,475.

Mr. QUIN. You are leaving in there the \$16,000,000 already expended?

Mr. COOPER. I think the Secretary of War stated it as \$17,000,000. I think it will be \$17,000,000, and I have included that amount in my figures. The last item is the item in reference to the overflowed lands, amounting to \$2,331,000, and that makes a total of \$83,175,475. These are the War Department figures which I have confirmed this morning in consultation with the Chief of Engineers.

Mr. QUIN. This proposition covers a governmental activity for navigation, a quasi governmental activity for fertilizer, and nitrates; that is what is proposed, is it not?

Mr. COOPER. I do not think I am competent to pass on that. I can only tell you about the engineering side of it and the cost side of it. Just what the Government plans are is something I do not know anything about.

Mr. QUIN. You are just putting up the proposition that Mr. Ford ought to be charged with all the interest on the amount invested at 4 per cent?

Mr. COOPER. Before I get through I have a constructive suggestion to make to the committee about this 4 per cent proposition. I think I will be doing a real service, in helping along a plan that will enable Congress to accept Mr. Ford's proposition unless something very much better comes along.

Mr. QUIN. According to your method of reasoning, Mr. Cooper, the Government would be charging up against the folks 4 per cent interest, based on the \$700,000,000 we have put in the river and harbor improvements since we have been engaged in that line of activity for the benefit of all the people; is that true?

Mr. COOPER. I do not think that is hardly an analogous case, although if I were to express my personal opinion I would say that nothing on rivers and harbors should ever be done unless you could see it was going to earn something.

Mr. QUIN. We think it earns something for the benefit of commerce.

Mr. COOPER. What the value of the Ford proposition from the point of view of navigation or war preparation is, you might as well ask the elevator boy; I do not know anything about it.

Mr. QUIN. You think Dam No. 2 ought to be finished?

Mr. COOPER. I certainly do.

Mr. QUIN. Did you design Dam No. 3?

Mr. COOPER. No, sir.

Mr. FISHER. Mr. Cooper, you have been a witness at practically every investigation that has been made by Congress in reference to Muscle Shoals, have you not?

Mr. COOPER. Yes, sir; and probably on every water-power proposition in the last 15 years.

Mr. FISHER. In reference to your estimate of the Ford offer, I would like to ask you just what value you place on plant No. 2, taking into consideration having it ready under the terms of the contract always as a nitrate plant for the Federal Government and subject to the Government's demand.

Mr. COOPER. You mean how much I estimate it would cost to finish it?

Mr. FISHER. What is the value of the plant to the Government? You gave figures as to what the Ford offer would cost the United States.

Mr. COOPER. Yes.

Mr. FISHER. Under the terms of the contract, Mr. Ford has agreed to deliver nitrate plant No. 2 all the time ready for the United States Government when not in use by the United States Government, but subject to its demand in time of war, and to maintain there a laboratory for the use of the Army officers in connection with nitrate preparedness; and at the end of the 100 years to turn back to the United States that plant in perfect condition to manufacture nitrates if the Government wants it. Have you estimated what that value is to the United States Government?

Mr. COOPER. No.

Mr. FISHER. Have you estimated it at all? Have you in your figures, which run up to a very considerable amount, estimated what the value would be to the United States to have there a fertilizer factory which will produce fertilizers for the farmers of this country? You have made an estimate amounting to a tremendous sum as to what the Ford offer would cost the United States Government. I ask you have you made any estimate of the value of the other propositions?

Mr. COOPER. No.

Mr. WRIGHT. Colonel, did you take into consideration the amount Mr. Ford pays annually into the amortization fund?

Mr. COOPER. Yes, sir; the figures are all there.

Mr. WRIGHT. What do you say it will amount to at the end of a hundred years?

Mr. COOPER. \$1,275,000,000.

Mr. WRIGHT. Do your tables show how you arrived at that figure?

Mr. COOPER. Yes.

The CHAIRMAN. On what page are those figures?

Mr. COOPER. On pages 1, 2, 3, and 4. I can send to the committee the detailed mathematical calculations from one stage to another if you desire it. These are the results.

The CHAIRMAN. If you would like to have it put in the record we will be glad to have it.

Mr. COOPER. I do not care what goes into the record.

The CHAIRMAN. The chairman would be very glad to have your statement put into the record.

Mr. COOPER. You shall have it.

Mr. STOLL. Mr. Cooper, I do not know whether I understand your statement correctly or not. You mean if the Government accepts Mr. Ford's offer and completes Dam No. 2 and builds Dam No. 3 at a total cost of \$50,000,000, that at the end of the lease period it would cost the Government \$1,275,000,000 more than Mr. Ford pays to the Government.

Mr. COOPER. Yes; I mean exactly that.

Mr. STOLL. That is all predicated on the idea that the Government is investing that money at 4 per cent interest?

Mr. COOPER. That money is worth 4 per cent, whether it is loaned or received.

Mr. STOLL. The Government has never undertaken to lend out money, has it?

Mr. COOPER. Yes; I think it has. If you pay 4 per cent for your loan that established the price, or rather the value, of money.

Mr. STOLL. If an individual had a hundred thousand dollars and he laid it aside and did not invest it, at the end of 25 years he would still have the hundred thousand dollars in his safe deposit box.

Mr. COOPER. Yes; but it would not be good business.

Mr. STOLL. No; but he would not have anything but the \$100,000. If the Government is in the business of loaning money, the \$50,000,000 they spend to build this dam, unless they do put it out at interest, they still will have at the end of the 100 years.

Mr. COOPER. I do not think that is quite true, because as long as the Government is borrowing it will be paying interest at the rate of 4 per cent, which it ought to be protecting itself against. If the Government did not loan Mr. Ford \$2,000,000 annual payments, but instead used this money to reduce loans already out the net results on the Treasury would be the same as if these payments were actually loaned.

Mr. STOLL. But this is all predicated on the idea that the Government puts this money out, which it does not do.

Mr. COOPER. It does it in effect, as long as the Government borrows money, and I guess it will always be a borrower.

Mr. STOLL. In effect; but the fact is they do not do it; so that you have figured this on a false basis, have you not?

Mr. COOPER. No; my basis is in no sense a false basis, as I have previously explained.

Mr. STOLL. They have spent \$16,000,000 on Dam No. 2, have they not?

Mr. COOPER. Yes; I think it will be about \$17,000,000.

Mr. STOLL. Could that dam be salvaged at any value?

Mr. COOPER. No, sir.

Mr. STOLL. It has to be completed, or it is useless, and there will be that much money thrown away?

Mr. COOPER. That is correct.

Mr. STOLL. Suppose it is not completed. Have you figured what it would cost the Government for 100 years, based on the \$17,000,000?

Mr. COOPER. I have not.

Mr. STOLL. Would it not be practically one-third of what it would be on the \$50,000,000?

Mr. COOPER. Yes.

Mr. STOLL. Which do you think is the wiser proposition, to complete the dam or not to complete it?

Mr. COOPER. It is much wiser to complete it for many reasons.

Mr. GARRETT. Mr. Cooper, on page 2 of your statement you have estimated for the completion of Dams Nos. 2 and 3, \$50,000,000?

Mr. COOPER. Yes.

Mr. GARRETT. That is the estimate of the Government engineers?

Mr. COOPER. Yes.

Mr. GARRETT. Mr. Ford's engineers estimated the cost to be about \$42,000,000. What do you think it will cost?

Mr. COOPER. I think Mr. Ford's engineers are mistaken.

Mr. GARRETT. You think your figures are right?

Mr. COOPER. I think they are, and if there is any change made it will be more than \$50,000,000, instead of less.

Mr. GARRETT. On what do you base that statement?

Mr. COOPER. On 30 years' experience in building dams.

Mr. GARRETT. And the \$33,000,000 additional which you add would bring the total up to \$83,000,000. Those items are made up of one of supposed interest for a certain period, another is for money already spent on the dam, and then there is another item for flowage rights. You put all of those elements of cost in your estimate and add to that the \$50,000,000, which makes a total of \$83,000,000, and then you calculate on that basis for the next 100 years.

Mr. COOPER. It does not come quite to 100 years; it is about 94 years.

Mr. GARRETT. At the end of the lease period.

Mr. COOPER. Yes.

Mr. HULL. Mr. Cooper, I was unfortunately not able to be here at the beginning of your statement. Have you covered the question of the 100-year lease to Mr. Ford? Do you consider that unreasonable?

Mr. COOPER. Very.

Mr. HULL. Why?

Mr. COOPER. Because nobody on earth can tell anything about the conditions 100 years from now, or any fraction of 100 years from now. If you will look at the conditions in 1822 and run your mind's eye over what has happened between 1822 and 1922, you can readily see no human being could have made a contract in 1822 that would have covered the conditions that have occurred since that time even for a 50-year period.

Mr. HULL. As a business man would you spend fifteen or twenty million dollars without having a lease of 100 years?

Mr. COOPER. Yes; I am an engineer for corporations that are planning to spend more than \$100,000,000 on 50-year leases now.

Mr. HULL. What is the lease on the Keokuk dam?

Mr. COOPER. That is perpetual?

Mr. HULL. You built the dam?

Mr. COOPER. Yes.

Mr. HULL. Did you think that was unreasonable?

Mr. COOPER. You mean the time?

Mr. HULL. Yes, sir.

Mr. COOPER. No, I did not think so; but I will tell you that coal in that district was \$1.40 a ton, against which we had to compete.

Mr. HULL. What is the price of coal now?

Mr. COOPER. There?

Mr. HULL. Yes.

Mr. COOPER. I think it is about \$2.30.

Mr. HULL. What are you getting for horsepower out there?

Mr. COOPER. That comes a little later in this same paper, and if you can kindly let me get to it in that way, I would prefer it.

Mr. HULL. Certainly. A year ago, if I remember correctly, your testimony was to the effect that the Government could finish this proposition itself.

Mr. COOPER. Yes; and if the Government will take my advice it would do that now.

Mr. HULL. You would recommend that now?

Mr. COOPER. Yes; right now.

Mr. HULL. What do you think we could get for the power there? That is, what do you think the rate per horsepower would be?

Mr. COOPER. I think you could lease it on the basis of a return to the Government of 5 per cent on all the money they put in it.

Mr. HULL. Of course, that is on Dam No. 2?

Mr. COOPER. Yes.

Mr. HULL. You would not build Dam No. 3?

Mr. COOPER. I do not know much about Dam No. 3.

Mr. HULL. Would you have to build Dam No. 3 to have navigation?

Mr. COOPER. Yes.

Mr. HULL. You would have to take that into consideration if you were trying to solve the navigation problem at the same time?

Mr. COOPER. Yes.

Mr. HULL. You have not any opinion in regard to nitrate plant No. 2, or plant No. 1? In reference to that part of it you have not any fixed opinion?

Mr. COOPER. No scientific opinion, but a little later I would like to tell you something that has recently come to my attention about the fertilizer game itself that may apply to those two plants.

Mr. HULL. You said the 100-year period is unreasonable. What would be a reasonable length of time for a lease on this property?

Mr. COOPER. I think 50 years would be a maximum time. That time should not be allowed unless the lease was subject to public service regulation.

Mr. HULL. He would be subject to the laws of Alabama, would he not?

Mr. COOPER. I do not know anything about that part of it. I have seen a statement in the newspapers that he was not to be subject to the laws of any State or the United States, in that sense. I do not mean to say that the gentleman was contemplating murder, or anything of that kind, but I mean, in direct reply to your last question, that he would not come under the Federal water power law or not under the State law. He is to have a straight lease, and that would exempt him from the action of the laws of Alabama. That is what I have seen and read; I do not know anything about it except what I have read in the newspapers.

Mr. HULL. I think not; but that is a question we can take up later. You as an engineer take the 50-year limit of the Federal water power law as a proper limit?

Mr. COOPER. Yes; it is long enough.

Mr. HULL. In all cases?

Mr. COOPER. Yes.

Mr. HULL. I am glad to hear you say so.

Mr. COOPER. I have always said so.

Mr. HULL. I have understood that most engineers think that is a handicap.

Mr. COOPER. I have been advocating the 50-year period for 10 years.

Mr. HULL. Let us go back to the question of the Government finishing the proposition. Suppose the Government would finish it. You understand, of course, that it would be impossible to administer it through Congress, and the Government could not administer it unless a corporation was organized to take it over; is that not true?

Mr. COOPER. That is true, but my theory in connection with that, Mr. Hull, is that you can always get a better price for something that is usable than for something that is about half completed.

Mr. HULL. I am glad to hear you say that, because you are an expert, and I have advocated that thing for some time.

Mr. COOPER. We are in entire accord on that.

Mr. HULL. You say it would take \$50,000,000 to finish it?

Mr. COOPER. I think so.

Mr. HULL. You could not finish it for less and make the river navigable?

Mr. COOPER. Not navigation that would be equally valuable. You could restore the canals along there, but the canal navigation is not worth much.

Mr. HULL. There would not be any question that if we finished it, as proposed in the Ford proposition, that we would have good 6-foot navigation up the river?

Mr. COOPER. No question on earth about that for the stretch of the river affected by dams 2 and 3.

Mr. HULL. There is not any question about the power that these dams will develop under the Ford proposition, is there?

Mr. COOPER. I do not think so.

Mr. MILLER. Mr. Cooper, what period of time have you allowed for the completion of Dam No. 2?

Mr. COOPER. Thirty-six months.

Mr. MILLER. How long do you consider it would take to construct Dam No. 3?

Mr. COOPER. About the same time.

Mr. MILLER. Would you carry on those operations simultaneously, or would you complete Dam No. 2 and then go to Dam No. 3?

Mr. COOPER. Complete Dam No. 2 first.

Mr. MILLER. Then you have a period of six years to cover.

Mr. COOPER. Yes, sir.

Mr. GREENE. Of course, the Federal Government now holds the lessees of water power to a 50-year contract.

Mr. COOPER. Yes.

Mr. GREENE. If we were to give Mr. Ford 100 years we might give him the advantage in the way of competition with people who do not derive the support of the Federal Government in their enterprises.

Mr. COOPER. And if the price of coal goes up, as nearly everybody thinks it is going, at the end of 100 years the Ford lease would be worth a perfectly fabulous sum.

Mr. QUIN. Mr. Cooper, your interest charge which you have allowed would bring Mr. Ford out in debt to the Government to the amount of \$1,200,000,000, would it not?

Mr. COOPER. Oh, no; not at all; he would not owe the Government anything.

Mr. QUIN. You mean that is just what it would theoretically bring to the Government?

Mr. COOPER. No; no theory at all; it is a practical matter. The taxpayers would have to pay this \$1,275,000,000 of real money into the United States Treasury because Mr. Ford's payments did not meet the costs to the Treasury of the properties leased by that amount.

Mr. QUIN. Mr. Elliot—and no doubt you are familiar with his work—said that if 1 cent were invested on the 1st day of January A. D. 1, drawing 6 per cent interest per annum, compounded every year, up to January 1, 1895, would have amounted to \$8,497,840,000; then we have lost all that, have we not?

Mr. COOPER. Nothing like that at all.

Mr. GARRETT. In response to a question asked of you you said that if coal continues to go up, at the end of this 100-year period the lease would be worth a fabulous sum.

Mr. COOPER. Yes; I would say for the last 50 years of the period.

Mr. GARRETT. But at the end of the 50 years—

Mr. COOPER (interposing). It all goes back to the Government.

Mr. GARRETT. Then the Government would have this property that had been brought up to a high state of development?

Mr. COOPER. And would have great value.

Mr. GARRETT. It would have great value to the Government?

Mr. COOPER. It would have great value to the Government.

Mr. GREENE. In making that answer have you taken into consideration the fact that one of the propositions submitted by Mr. Ford is that whatever disposition the Government may seek to make of this property at the end of the 100-year lease Mr. Ford's heirs or assigns or the company that represents them shall have a perpetual right to the power.

Mr. COOPER. I did not know that they had a perpetual right to the power, I thought they had a perpetual preference right.

Mr. GREENE. That is the point in contention, but the language was interpreted by some to give them a perpetual right to take the power at reasonable rates.

Mr. COOPER. I think that may be so, but I am not a lawyer, and I do not want to get into that end of it.

Mr. STOLL. In reference to the question I asked you a while ago when I said the Government was not in the business of lending money, I meant that was not their business; that is, lending any surplus money they might have. Of course, it is true they do have arrangements for lending money to farmers, based on farm security. I meant any surplus money.

Mr. COOPER. Not as bankers per se.

The CHAIRMAN. We will be glad to have you continue your statement, Mr. Cooper.

Mr. COOPER. I thought it would be of interest to the committee to know something about the size of the waterpower that they were considering that was included in the Ford offer, and by size I mean the amount of energy covered by the lease. To estimate the quantity of power that will be available during the term of this lease is a very difficult question for any engineer to solve for the reason that undoubtedly, beginning at once and continuing for many years, there will be created in the valley of the Tennessee above these dams numerous storages which will greatly increase the value of these water powers. In my estimates I am now about to quote to you I have taken no account of that because I do not want to get into the realm of conjecture. I am only quoting from absolute measurements of existing conditions which I have made through my own organization, and therefore, in so far as that is worth anything it is authoritative, as far as I am concerned.

I find that the annual production of energy from these two dams will be 3,883,000,000 kilowatt hours. That does not mean anything to you or to me, because you can not comprehend it, or I can not at least, but it is the equivalent of 517,000 horsepower, 8,000 hours a year, which is about the current maximum of continuous use of power; 517,000 horsepower is the amount of power that 3,000,000 people normally use in commercial life. Perhaps that will give you some idea of how big the power is which is being talked about here; 517,000 horsepower will save about 5,000,000 tons of coal a year.

Passing from that statement, and keeping that in mind, I have made an estimate which represents an endeavor on my part to carefully and conservatively estimate what Mr. Ford's annual expenses will be when these two dams are completely in commission, in that way enabling us to find out how much power is to cost Mr. Ford under his proposed contract. If that has all been brought out here before I do not think I ought to take your time to talk about it, but if it has not been brought out I think it would be a good thing for you to know now.

The CHAIRMAN. I think we would like to have your view of the matter, at least.

Mr. COOPER. If you will turn to page 8, we can consider statements Nos. 2 and 3 together. I find, and this estimate is based upon practical experience, that a careful interpretation of Mr. Ford's proposed contract shows that his annual expenses or operating costs when dams Nos. 2 and 3 are finished, would be \$3,622,000 a year. That, of course, will include the \$2,000,000 lease money he will have to pay, and I have included taxes at the rate of \$765,000 a year, which is considerably less than ordinary water powers in the United States are now paying.

Mr. CROWTHER. May I interrupt to ask if the Alabama law exempting concerns for 10 years is still in force; that is, against power companies?

Mr. COOPER. I do not know; if it is, it ought not to be, in my opinion.

The CHAIRMAN. Mr. Martin, of the Alabama Power Co., is in the audience. Can he tell us about that?

Mr. MARTIN. That law is still in force and exempts the property, business, and franchises of companies engaged in the development of hydroelectric energy for a period of 10 years after the beginning of construction.

Mr. CROWTHER. Would that apply if there was any departure from merely primary production of that power, if there was any development considered or premeditated, if there was any subsidiary business in connection with it. Take, for instance, the fertilizer business. Would they still come under that exemption, or would it apply only to the development of hydroelectric power.

Mr. MARTIN. The statute, as it is to-day, provides that the property, business, and franchise of any person, firm, or corporation who may develop hydroelectric power is exempt for a period of 10 years after the construction. If you will examine section 2080 of the code of Alabama of 1907 you will find the full statute. It is only about 15 or 20 lines.

Mr. CROWTHER. It provides for an exemption for 10 years?

Mr. MARTIN. After the beginning of construction.

Mr. COOPER. In 10 years he would have to pay taxes, and I wanted to take the most generous view of it. I think the figures I have used should be used, and I do not want to be accused of trying to build up some situation that is in the slightest degree unfair from Mr. Ford's standpoint.

Mr. CROWTHER. It is not unfair if it is the law.

Mr. COOPER. I am not trying to build up a situation showing an artificial low price; I am trying to build up a situation that is normal in the business.

Mr. CROWTHER. You are being rather fairer than if you took the other proposition.

Mr. COOPER. Absolutely; I am not taking advantage of any law, or any storage, or anything else.

Mr. CROWTHER. I apologize; but I thought this would be a good place to have that put in the record.

Mr. COOPER. We can go back now to page 6. This is really the meat in the coconut. I will call your attention to the statement marked 6 (a). Figuring the annual expenses, as I have just quoted them, into the amount of energy that I previously showed as being derivable from the dams, we find that Mr. Ford would get his 24-hour power for \$10.80 a horsepower per annum, which is about half the current price for this class of power anywhere else in the United States. On the basis of a 60 per cent load factor, by which I mean a power that is used, such as the cotton mills use, and which is the ordinary

commercial power in the South, the power 6 (b) would only cost \$7.10 a horsepower, which is a good deal less than half the price in that territory. On secondary power 6 (c) the price would only be \$5.40 a horsepower. I would like conclude this part of the statement by saying that as a net result of the proposition, as it is written, Mr. Ford will be getting the cheapest power on the American Continent. Whether Congress wants to give it to him is another matter, and I do not enter into that field at all.

Mr. STOLL. That is predicated on the idea that he can sell or utilize all of this power.

Mr. COOPER. Oh, yes; I think he can.

Mr. STOLL. You think he can. Are there enterprises there now that use that much power?

Mr. COOPER. I will come to that in connection with another statement.

The CHAIRMAN. The Chief of Engineers of the War Department told this committee at the beginning of these hearings that along in 1921 he was instructed by the Secretary of War to invite bids from the men who might be interested in continuing the work at Muscle Shoals. He told some 8, 10, or 12 men of this country who were engaged in building up plants of that kind to make some offer to the War Department or to the Secretary of War for the utilization of the plant at Muscle Shoals, and the only favorable reply he received from anybody was the reply from Mr. Ford. They all seemed to be afraid of the thing, but Mr. Ford really did make an offer. Then the Secretary of War wrote Mr. Ford that his offer did not even contemplate interest on the great expense of building Dam No. 2, or completing it, and building Dam No. 3. Then Mr. Ford made a subsequent offer which is the offer we have before us. Now, taking your statement of the situation at Muscle Shoals, do you not think it rather remarkable that nobody else in this country was willing to make an offer regarding the plant at Muscle Shoals, except Mr. Ford?

Mr. COOPER. Mr. Ford has more money than anybody else in the United States. I do not think that is very remarkable.

The CHAIRMAN. Of course, he has considerable means; but do you not think there was a risk involved in the proposition? Was he not taking any risks at all?

Mr. COOPER. I do not think so at all. Not at these prices; no.

The CHAIRMAN. You think it was not surprising that all these other men who were already in the business—

Mr. COOPER (interposing). I think if anybody in the business had thought that Congress would take such a kindly view of a price as cheap as his there would have been several fellows bidding.

The CHAIRMAN. We had some exhibits in the hearings showing that quite a number of big corporations handling water power found it could not be worked at all through Congress, and rather sneered at the whole thing.

Mr. COOPER. I have read those statements; I think they were made with a deliberate attempt to bear the market; that is what I think of them all. They were not made in good faith. I want to say that with especial emphasis.

The CHAIRMAN. We respect you for making a courageous statement.

Mr. COOPER. I thank you.

The CHAIRMAN. That is a remarkable view of the situation—that it was done to bear the market.

Mr. FIELDS. Are your statements in the paper you are talking about?

Mr. COOPER. Those are the ones I am talking about specifically. On page 10 you will find the last statement. It shows that if Mr. Ford would pay 4 per cent on the \$83,000,000. Instead of \$50,000,000 (his present offer equals about 2½ per cent on \$83,000,000), he would still get the power for a price 20 per cent less than he could anywhere else on the American continent. If I was as rich as Mr. Ford, or half as rich, I would not be trying to pry that other 1½ per cent out of the United States Treasury; I would go down there and take this job and pay 4 per cent on the whole thing.

The details are all shown in this statement, and I do not think it is necessary to take the committee's time in going into the details. I hope I have made myself plain, that if he paid 4 per cent on the \$83,000,000, and thereby save the Government \$1,275,000,000, he would still have in his possession for 100 years the greatest water power in the South, and at a price that is abnormally cheap.

If there are no questions I only have one or two more statements to make, and then I will be through.

Mr. STOLL. You said you would state how he could utilize that power.

Mr. COOPER. I am coming to that.

The CHAIRMAN. The flowage rights between Dam No. 2 and Dam No. 3 have been estimated in statements made to the committee at from \$1,500,000 to \$2,000,000. Do I understand you to say that you think, instead of asking the Government to include those lands in the purchase rights, he should be willing to pay 4 per cent interest on the amount the Government is to lay out for that land?

Mr. COOPER. Not only that, but all the money the Government has spent up to date, including \$16,000,000 which has been spent on Dam No. 2 and on which there is lost interest. Mr. Ford would still have a most wonderfully valuable water power.

I think if there is any value in any statement I have made to this committee, to-day, it is this statement I have just now made to you. You will find, if you go to the bottom of it, it is the truth, too.

Mr. PARKER. I think your statement shows he gets his horsepower at a very cheap price compared with present rates. I understand you to say horsepower rates are likely to rise from year to year.

Mr. COOPER. Very much so.

Mr. MORIN. It is your judgment that the flowage rights the Government will acquire under the Ford offer could be purchased at \$1,350,000?

Mr. COOPER. I do not think so; because in all the history of flowage rights there has never been one of those estimates which has been right.

Mr. MORIN. What would be the amount?

Mr. COOPER. If I was going to guess at it I would double it. At the Keokuk Dam I estimated the overflow lands at \$1,500,000 and some thousand dollars, and it cost us \$4,500,000. I had 300 options on all kinds of land to guide us in that estimate.

The CHAIRMAN. The United States Government was not buying that land.

Mr. COOPER. No; easy people were buying it.

The CHAIRMAN. But the United States Government would be buying this land. You know how prices rise when the Government wants to buy anything.

Mr. COOPER. Yes; it is a very bad situation.

Mr. MORIN. Would it be necessary for the United States Government to acquire land for railway and terminal connections there?

Mr. COOPER. In any of these places?

Mr. MORIN. Yes.

Mr. COOPER. I do not think so.

Mr. FIELDS. Would you charge any part of the flowage to navigation?

Mr. COOPER. Not until there was some navigation to charge it to.

Mr. FIELDS. If the dams are completed?

Mr. COOPER. You have to complete Dam No. 1.

Mr. FIELDS. If Dam No. 1 was completed there would be navigation?

Mr. COOPER. Yes; up to end of the pool back of Dam No. 3.

Mr. FIELDS. Then would you charge anything?

Mr. COOPER. No; not unless there was some real navigation on the river. I can tell you a very short story, but it is a very interesting one, and I think this committee ought to know it. At Keokuk we spent \$2,000,000 in the construction of a lock and dry dock, which we gave to the Government. The interest on the \$2,000,000 would buy all of the boats that run up and down there, and if we burned up the boats and the cargoes they carried we would still have a handsome profit. I had a delectable experience with the master of one of those boats on the Mississippi River. He took me down onto his boat and showed me a cargo he was hauling from St. Louis up to St. Paul and back to St. Louis and thus show some freight movement, so they could come down here and get some more money. I saw that cargo myself, and the captain showed it to me.

The CHAIRMAN. You mean come to Washington?

Mr. COOPER. Yes; the Upper Mississippi River Improvement Association.

The CHAIRMAN. They wanted to show—

Mr. COOPER (interposing). A tremendous business.

The CHAIRMAN. So as to mulct the Treasury of the United States?

Mr. COOPER. Absolutely.

The CHAIRMAN. The men who are engaged in that business are traitors to their country.

Mr. COOPER. Of course they are.

Mr. GARBETT. I understood you to say you thought Mr. Ford should pay interest on \$83,175,000. That includes the original cost also, and added to that the two or three million dollars for flowage rights.

Mr. COOPER. The interest on it?

Mr. GARRETT. The interest on all of it.

Mr. COOPER. Yes.

Mr. GARRETT. You think if this proposition of Mr. Ford should not be accepted, and another proposition should come to the committee, whoever makes those propositions should be governed by the same rules?

Mr. COOPER. Absolutely. I have a statement to make which is not an opinion, but is a statement of fact also, but I think will be a surprise to this committee, and it is something that ought to be, and I hope will get into the newspapers, and get down South around Florence, so that when I go down there the next time they will not shoot me.

I am very well aware of the tremendous desire of the people in the South, especially those in northern Alabama, for the consummation of Mr. Ford's proposals. They have good reason to want it, and I do not blame them; I would want it, too, if I were there.

As I understand Mr. Ford's proposal, it is a proposal on his part to go into various lines of chemical work. He has said that in public print in many places. I doubt exceedingly the wisdom, from the standpoint of the public interest in the South, of taking out of the water-power reserves in the South so great an amount as 517,000 horsepower. I think the time will very soon come, if this is consummated, that the very people in the South who are clamoring for the acceptance of this proposal will be crying for its abrogation. That opinion would not be worth anything if I could not point to something specific to back it up.

It just so happens that 20 years ago at Niagara Falls they started to build what is now 400,000 horsepower. At that time they could not get a market for it, so they took in the chemical people. The chemical people and the water-power people tied up and built up a great industry, all in chemistry. But it is a fact that this water power at Niagara Falls did not even get as far as Buffalo, 23 miles away. And two years ago Buffalo had to pay for the operation of a steam plant at a cost of \$10,000,000, and that city is within 23 miles of the greatest water power in the world, so called.

Now, then, since the last year there has been a widely concerted movement all over the State of New York, represented by counties, by numerous mayors, and chambers of commerce, and all kinds of barn-stormers at Albany, to get the power situation at Niagara Falls corrected, and at this moment, this very moment, they are passing legislation that is absolutely conclusive and compelling, so that the power at Niagara Falls can be distributed all over the country, and no more of it go into chemistry. Gov. Miller of New York has sent a message to the legislature on that subject. The water-power commission has recommended that it should be done. I do not want to be understood as saying that these chemical industries at Niagara Falls were a curse to the country. Far be it from me to say that. They actually accomplished a great good, and the country would have been in a dickens of shape in this war without all of them. But there is a limit to which any more water power should be assigned to chemistry. The whole State of New York, and all these people up there, after only 20 years of experience with the chemical industries, are storming the legislators to stop the use of power in chemistry in a territory that is buying coal for power use. Chemical industries do not use very much labor. Take the Aluminum Co.

Everybody knows that they are a tremendously large company and very successful, and the Lord only knows what we would have done in the last war without them. They have 150,000 horsepower in the aluminum works at Messina, and the town is not much bigger now than it was 20 years ago. What they need to do in the South is this: The South needs cheap, reliable energy to be distributed all over the country, for the assistance of a large territory. Secretary Lane was the author of the movement to investigate the superpower zone question. The quickest way to get a superpower zone in the South is to have the assistance that can only come from these two powers at Muscle Shoals. If you put these two powers at Muscle Shoals away into chemistry it will be the same thing as taking a vertebra out of a man; there is nothing to fasten the ribs to. You would not have anything to start a superpower zone with at all. When these people get over their present spell they will see very plainly the errors in their present enthusiasm.

I am not going to plead for the rejection of Mr. Ford's proposal at all, but my conscience requires that I make the foregoing statements, after which I do

not care what Congress does. I think it would be a tremendous calamity to the South if the greatest water power they have got should be taken out of the field of public utility for 100 years.

The only other question I have in my mind is this—and on that I can not speak with definiteness—that the value of this whole great mass of energy at these two dams is not possible to estimate, because no one can tell how much the price of coal is going up. We can very readily see where at the end of 50 years of this lease that this power would be worth more than twice what it is now, due to the increased cost of coal.

Now, finally, I want to say I can not understand how anybody would want to take this great property upon which the Government has spent around \$33,000,000, which is admittedly the greatest water power in the South, and put it where no representative of the public could really regulate the price and regulate those to whom it shall be delivered, and the class of service, and all that concerns the public interest. I really think if a water-power man had come down here and had made the same proposition Mr. Ford has made he would never have lived to get home. It is an astounding proposition.

Mr. MORIN. If we should decide to accept Mr. Ford's proposition, what do you think should be the limit of the term of the lease?

Mr. COOPER. Fifty years.

Mr. MORIN. That is the maximum?

Mr. COOPER. Yes.

Mr. MORIN. You do not think his proposition should be accepted?

Mr. COOPER. Not in its present terms. I think Mr. Ford is bright enough and his men around him are bright enough so that they will accept all of these suggestions I have made here to-day before they will let this property go.

Mr. MORIN. Do you think if the Government should complete those works itself they could then find somebody to operate the works for 50 years to better advantage than by accepting Mr. Ford's proposal?

Mr. COOPER. You mean the power plant?

Mr. MORIN. Yes.

Mr. COOPER. I do not believe I quite understand your question.

Mr. MORIN. If the Government, after finishing this work itself, would be able to get some concern to take over this proposition at Muscle Shoals and operate it to better advantage than by accepting Mr. Ford's proposition; that is the question?

Mr. COOPER. Yes; and right here I would like to say one thing about fertilizers, if the committee is not tired. This is an entirely new angle of it. I have been sitting in on fertilizer conferences for 10 years. I was sent for by the British Government 10 years ago to go to Egypt and sit in on a conference in connection with a fertilizer plant for the Nile Valley. As a designer of water powers I have been seeking successful fertilizers as a justification for building water powers that have not any other market. During all these 10 years I have discovered that the discoveries themselves are outrunning anybody's willingness to go beyond a certain point, because the state of the art is very new; that is to say, they do not know much about it, so far as I can find out—not any of them.

When we realize that chemistry is at the beginning of its development, and electricity also, I think it is a perfectly wild statement to expect that 110,000 tons of ammonium nitrate is the way out. That I know is not so.

I happen to know of a tremendous new fertilizer program that is coming to America from Europe that will only take a third of the power that this ammonium nitrate requires. I am told on authority that does not go back to any fertilizer company at all but through other circles that it will be a revelation and a revolution in the fertilizer business, and I do not see how you would be willing or anxious to tie down to any particular thing, especially when all of the processes of nitrogen recovery and all these other recoveries are admittedly by all scientists in a very inefficient state of development.

Mr. MORIN. Do you think that Mr. Ford could produce fertilizer at prices to compete with other concerns?

Mr. COOPER. I do not believe my judgment on that is worth anything; I do not know.

Mr. HULL. Mr. Cooper, we do not tie ourselves down to any particular development along the fertilizer line if we accept Mr. Ford's proposition; it is open.

Mr. COOPER. I can not see where Mr. Ford's promise is to do anything. He just promises to investigate. There are a great many different men invest-

gating fertilizer now, and surely they have not any such proposition as this behind them.

Mr. HULL. He promises to investigate and to have that investigation controlled by an independent commission to work out the best way of producing fertilizer. If, as you say, something new comes along, they unquestionably would undertake to take that up.

Mr. COOPER. That is a matter that is entirely in the wisdom of Congress; it is not an engineering question.

Mr. HULL. You do not care to speak about that feature of it?

Mr. COOPER. My opinion is not worth anything on that.

Mr. HULL. If it would cheapen fertilizer material it would be worth all it is costing the Government, would it not?

Mr. COOPER. No, I don't think so. According to some of the previous testimony here to-day I think you will have to pass a law compelling the farmers to use it in many cases.

Mr. HULL. There has been some question as to the difference in the cost of finishing the dams. Some people have claimed that Mr. Ford could finish them cheaper than the Government. You are fairly conversant with the Government operations down there, so far. Have they been extravagant?

Mr. COOPER. No.

Mr. HULL. Do you think the Government could finish that work with their present organization, building up the same organization that they had, and finish it as cheaply as anyone else?

Mr. COOPER. Taking everything into consideration, I would say yes.

Mr. HULL. I heard you say it had cost the Government \$33,000,000 up to the present time. I do not quite understand that. I thought the river development had cost \$30,000,000.

Mr. COOPER. That takes in a lot of other items.

Mr. HULL. The flowage rights?

Mr. COOPER. Yes, and loss of interest up to date.

Mr. HULL. That is all water over the wheel.

Mr. COOPER. Yes, but in private life we have to take care of it.

Mr. HULL. The Government has not taken care of what they got.

Mr. COOPER. I think the Government will have to take care of what they have been letting run away, pretty soon, or we will all be busted.

Mr. HULL. Summing it up, you think the Government ought to finish this work unless we can get a better proposition; is that your view?

Mr. COOPER. Yes.

Mr. HULL. Suppose you were a member of this committee, trying to conserve the Government's interest and save money as best we may, and you were satisfied that we could not get the money to finish this up, and this thing was standing down there, and a man came along like Henry Ford and offered to finish it up, and he was the only one who did make such an offer. What would you do then?

Mr. COOPER. I do not believe I would be bothered about that, because one of your premises is wrong in connection with that.

Mr. HULL. Which one?

Mr. COOPER. Your premise that you cannot get the money.

Mr. HULL. We tried very hard.

Mr. COOPER. I mean Government money.

Mr. HULL. We tried our best a year ago.

Mr. COOPER. I think you could get it now.

Mr. HULL. We did not get it through Congress, and we tried the best we could to get it through Congress. But there is one question I would like to have your opinion on as an engineer; that is in regard to the Gorgas plant. According to Mr. Ford's proposition we have to buy the Gorgas plant. Is that necessary for the completion of his project?

Mr. COOPER. No, I do not think so. I do not know enough about Mr. Ford's plans to really answer that question.

Mr. HULL. Is the perpetual-preference plan that Mr. Ford puts in there unfair?

Mr. COOPER. The 100-year business?

Mr. HULL. No; the preference right at the end of the lease.

Mr. COOPER. I think so.

Mr. HULL. That is simply a preference to him?

Mr. COOPER. I know, but you do not know anything about what kind of people the Fords will be 100 years from now or 50 years from now.

Mr. HULL. That means that having the property there, and having developed it, if two companies offer the same thing, the Ford company should be given the preference. Why is that unfair? I understand that some people say it is unfair, but I can not see why it is unfair.

Mr. COOPER. Because you can never compel anybody in the United States to do anything that they ought to do unless they really want to, by law or in any other way.

Mr. HULL. It would be up to Congress.

Mr. COOPER. I know, but you can pass all the laws you want to, and if a fellow did not want to do right he would not do it. They always get out of it. You have got to have the will to do right before you really do right.

Mr. HULL. If you rent a farm to a man and put in a provision in the lease that at the end of the lease period you will give him the preference in re-leasing it, that is not unfair, is it?

Mr. COOPER. That is not an engineering question, and I do not want to discuss it any further.

The CHAIRMAN. We have a case now before the whole country of a law passed by Congress and ratified by the States, but the people do not seem to like the law, and they break it. That is the prohibition law.

Mr. FIELDS. And that is getting better.

Mr. MILLER. What is the horsepower at the Keokuk Dam?

Mr. COOPER. We are now generating a maximum each day of about 165,000 horsepower.

Mr. MILLER. And the cost of the Keokuk Dam was how much?

Mr. COOPER. About \$24,000,000.

Mr. MILLER. That was built in what year?

Mr. COOPER. It was finished in 1912.

Mr. MILLER. At the time the dam was completed was there a demand for the maximum amount; that is, at the Keokuk Dam?

Mr. COOPER. No.

Mr. MILLER. Is there a demand for the maximum amount now?

Mr. COOPER. We are entirely sold out. I happen to be the vice president of the company.

Mr. MILLER. How do the rates per kilowatt hour at the Keokuk Dam now compare with the rates you got when the power was first developed?

Mr. COOPER. About 25 per cent higher.

Mr. MILLER. How long were you at Muscle Shoals?

Mr. COOPER. The first time, about two months.

Mr. MILLER. Are you acquainted with what is known as the prospective Dam No. 3?

Mr. COOPER. Yes.

Mr. MILLER. How does the size of that dam—that is, the dimensions—compare with Dam No. 2?

Mr. COOPER. It is somewhat longer and much less in height.

Mr. MILLER. Dam No. 2 has a drop of about how much?

Mr. COOPER. About 94 feet.

Mr. MILLER. Over the gates?

Mr. COOPER. Yes; the difference between the two levels is about 95 feet.

Mr. MILLER. What is Dam No. 3?

Mr. COOPER. Thirty-eight feet.

Mr. MILLER. That fall of 38 feet at Dam No. 3 backs the water up how far?

Mr. COOPER. I do not know, but I think about 60 miles.

Mr. MILLER. You back it up by the pool at Dam No. 2 only about 14 miles or something like that?

Mr. COOPER. Something like that.

The CHAIRMAN. I think the record shows that the distance the water is backed up by No. 3 Dam is 63 miles.

Mr. FIELDS. You say that you recommend that the Government complete the dam?

Mr. COOPER. In the absence of a better proposition than Mr. Ford's; yes. I understand the Alabama Power Co. has a project which is to be submitted to you, but I do not know anything about that except what I see in the papers.

Mr. FIELDS. It is your opinion that the dam should be completed?

Mr. COOPER. Unqualifiedly yes.

Mr. FIELDS. Then, in the event Mr. Ford's proposition should not be accepted, and a better proposition or a proposition that Congress would accept should not be offered what would you recommend that we do with the dam?

Mr. COOPER. I would get all the facts before each Congressman and each Senator, and I would be mighty sure they actually knew what the facts were, and I am sure they would vote for the proposition. The trouble with you, dear gentlemen, is that you have so much to do that you do not get all the facts on these things.

Mr. FIELDS. You would not recommend the operation by the Government?

Mr. COOPER. No, sir.

Mr. QUIN. Congress passed on that question last February, and they killed it.

Mr. COOPER. Do you not think Congress knows a lot more about that now than they did at that time? I know something about the things that killed it, and I do not think they are around here now.

Mr. QUIN. I am simply telling you what the record shows.

Mr. COOPER. I know what the record shows and I know what happened at that time, too.

Mr. QUIN. They did not let it go through.

Mr. COOPER. No; it was a fluke.

Mr. QUIN. You stated that the Government did not waste any money down there, that the work was done economically. There was a war investigating committee—one of those smelling committees—who investigated that proposition, and they reported great extravagances on that work.

Mr. COOPER. I do not think they did with reference to the dam. If they did they made a mistake.

Mr. QUIN. There was not any money wasted in the construction?

Mr. COOPER. No; I do not think there was in that sense.

Mr. QUIN. I am glad to hear that. I hope Congress will realize that. You say Mr. Ford would have the cheapest power in the United States?

Mr. COOPER. Yes.

Mr. QUIN. About how much per cent cheaper than any other power?

Mr. COOPER. If he paid 4 per cent on the total cost that would be 20 per cent less. On his present terms it is about half the price, and I can not see any earthly excuse for his having it at that price.

Mr. QUIN. With the extraordinarily cheap power he would have he would be able to make fertilizer and sell it cheaply to the farmers?

Mr. COOPER. If I correctly interpret what I have been listening to in the last five or six years, the price of power has a very small place in the total cost of fertilizer that the farmer buys, and under these new processes it would be a very small amount, and the farmer would never know the difference.

Mr. QUIN. With all this high cost of power in coal and transportation on coal, do you mean to say that water power at this very cheap rate would not enable him to make fertilizer cheaper than the steam factory can make it?

Mr. COOPER. Some of the new processes do not require much if any water power at all.

Mr. QUIN. If they come into use and Ford utilizes them, can he not make fertilizers out of any thing they can make it out of?

Mr. COOPER. He is a miracle man with the Ford car, but he can not do everything I believe.

Mr. QUIN. He puts out a five-passenger touring car that runs on the finest avenue in the United States, or on a cow path.

Mr. COOPER. I have one of them myself, so I know all about it.

Mr. QUIN. Is it not reasonable to presume that his expert men would be able to make use of this new method of making this fertilizer?

Mr. COOPER. Not do that, and do the other things they are trying to do. But I do not care whether you give it to him.

Mr. QUIN. You said the farmers would not use the fertilizer unless a law was passed to make them do it. Why not?

Mr. COOPER. I do not know; I do not understand farmers very well. The testimony here to-day indicates that farmers are slow to use fertilizers. I have heard a lot of them say they would not use it.

Mr. QUIN. You have not talked to the kind of farmers I know.

Mr. FISHER. Can we count on you to offer criticisms of the other offers made for Muscle Shoals?

Mr. COOPER. If you can stand it, I can.

Mr. FISHER. Have you examined the new offer which the newspapers state the Alabama Power Co. has made?

Mr. COOPER. No.

Mr. FISHER. I hope we will have the pleasure of a criticism from you on that if it is presented.

Mr. COOPER. I thank you.

Mr. STOLL. You expressed the opinion that Congress did not understand the proposition when they refused to complete dam No. 2. I suppose there were very few engineers in Congress at that time, and that there are very few in Congress at this time. Do you think it will help Members of Congress to see this plant? Do you think it will help them to come to a conclusion?

Mr. COOPER. Yes.

Mr. STOLL. You think it would be advisable to look at it?

Mr. COOPER. In 20 years I have never found a Congressman who would not do the normal thing if you get the facts down his throat.

Mr. STOLL. Under the figures in your table here these two dams would generate 850,000 horsepower. Can Mr. Ford utilize that himself in manufacturing?

Mr. COOPER. My own guess is—and this is the first time I have guessed for you to-day—that he is not going to make much fertilizer, but he is going to make aluminum for Ford cars.

Mr. STOLL. Can he use the 850,000 horsepower he will get there?

Mr. COOPER. Can he use it?

Mr. STOLL. Yes.

Mr. COOPER. I do not know.

Mr. STOLL. Is there any place there where he can sell it?

Mr. COOPER. Under present-day transmission if he goes at it in a normal way he can sell it to the public.

Mr. STOLL. Where?

Mr. COOPER. All around through the South.

Mr. STOLL. There are very few large cities around there.

Mr. COOPER. Cheap power makes a demand for more power always.

Mr. STOLL. How far can you send this power?

Mr. COOPER. More than 400 miles.

Mr. STOLL. That is an undeveloped country.

Mr. COOPER. Yes; I have been down there.

Mr. STOLL. Do you think you could sell that much power?

Mr. COOPER. Inside of 15 years; not in less time than that.

Mr. STOLL. That is problematical; he will have to find a market for his power. There is no market there now.

Mr. COOPER. If he carries out his aluminum project, which I think he has in mind, he is not going to have to look for a very large market.

Mr. STOLL. In making up your figures you figured on his getting a price for all this power.

Mr. COOPER. I figured on what it would cost him. I assumed he would sell it for more, else he would not make any money.

Mr. STOLL. That is the presumption, of course. He would not produce power unless he could sell it, of course.

Mr. COOPER. Many men have done it. I imagine he would follow the normal course. Everybody has to originally produce more power than he can sell and grow a market afterwards.

Mr. STOLL. Is there any way to store it?

Mr. COOPER. No.

Mr. STOLL. It would be dead loss unless he could dispose of it?

Mr. COOPER. Yes.

Mr. STOLL. In figuring his profits, is it not a rather wild guess to say he would make all this money, unless he could dispose of his current?

Mr. COOPER. No; I do not think so, because the price is so very low it will attract a market; that is the point. He can get a chemical market for it.

Mr. STOLL. Unless he does sell it, your figures fall down.

Mr. COOPER. Until he does sell it, the figures fall down. I have not said it was a profit at all; I did not use the word profit at all. None of these figures refer to a profit.

Mr. STOLL. You made the statement that he would get cheap power.

Mr. COOPER. You know cheap power does not mean that you have a profit out of it.

Mr. STOLL. He is too good a business man to spend that much money and develop 850,000 horsepower unless he could dispose of it in some way.

Mr. COOPER. He certainly has plans to dispose of it, but he does not reveal his plans.

Mr. STOLL. Do you not think the reason he wants a hundred-year lease is because there is going to be a gradual development?

Mr. COOPER. No; there is nothing like that.

Mr. STOLL. You never talked with Mr. Ford?

Mr. COOPER. No.

Mr. STOLL. You do not know what his plans are?

Mr. COOPER. No. But I know how fast a market for power grows. When we started 20 years ago in the Niagara Falls district you could hardly give away power, but to-day there is a market for 1,000,000 horsepower.

Mr. STOLL. That is a manufacturing district and is very thickly populated; they have large cities there.

Mr. COOPER. That is an instance of the extraordinary way in which that market has grown. But the market grown there has been created by the parent water-power situation.

Mr. STOLL. Within 400 miles of Muscle Shoals there would not be over a couple of million people.

Mr. COOPER. The statistics of the power business show that one horsepower is used by about five people. If there are 2,000,000 people within the transmission distance of Muscle Shoals, that is 400,000 horsepower.

Mr. STOLL. I do not know that there are 2,000,000 people there; that is guess-work.

Mr. COOPER. My memory is that it is something more than that.

Mr. STOLL. Within a radius of 400 miles of Muscle Shoals you think there would be 2,000,000 people?

Mr. COOPER. I would not say whether it would be 2,000,000.

Mr. HULL. There is just one question I want to ask you along the line of primary and secondary power. There is quite a difference in the two powers, as far as selling the power is concerned?

Mr. COOPER. There is a great difference.

Mr. HULL. Down there you would have a large amount of secondary power compared with your primary power?

Mr. COOPER. About twice as much, at the present time. But that ratio will change when you build your storages.

Mr. HULL. It will gradually change?

Mr. COOPER. And improve greatly.

Mr. HULL. That would be changed by the development of Dam No. 3?

Mr. COOPER. Not much.

Mr. HULL. The power at Niagara Falls and Keokuk is practically all primary power, is it not?

Mr. COOPER. No.

Mr. HULL. How much secondary power do you have at Keokuk?

Mr. COOPER. About half.

Mr. HULL. Can you sell that?

Mr. COOPER. Yes; we have sold all of it, every kilowatt.

Mr. MILLER. I asked this question of a gentleman early in the examination, whether the acquisition of a water power at Muscle Shoals was not the main inducing cause of Mr. Ford's submitting this proposal.

Mr. COOPER. I should think it was; yes, sir.

Mr. PARKER. You spoke of aluminum. How much horsepower would it take to make all the aluminum for the present manufacture of Ford cars?

Mr. COOPER. I am afraid I will not be able to give you a correct answer about that, but my guess is it would be about 250,000 horsepower.

Mr. FIELDS. I understood you to say you are connected with the Keokuk Power Co.?

Mr. COOPER. Yes.

Mr. FIELDS. Are you connected with any other power company?

Mr. COOPER. No.

Mr. FIELDS. Of the United States or Canada?

Mr. COOPER. No; just as an engineer.

Mr. FIELDS. What companies are you connected with as an engineer?

Mr. COOPER. With the Niagara, Lockport & Ontario Co., at Niagara Falls, and the Frontier Corporation, of New York. I am also connected with a few other power corporations.

Mr. FIELDS. Is this Niagara Falls concern you mentioned connected with the American Cyanamid Co.?

Mr. COOPER. No.

The CHAIRMAN. We are very much obliged to you for your very instructive and enlightening statement, Mr. Cooper.

(Thereupon, at 5 o'clock p. m., the committee adjourned to meet Monday, February 20, 1922, at 10.30 o'clock.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES.
Friday, February 17, 1922.

The committee met, pursuant to recess, at 2 o'clock p. m.

STATEMENT OF MR. THEODORE SWANN, PRESIDENT FEDERAL PHOSPHORUS CO., BIRMINGHAM, ALA.

The CHAIRMAN. Mr. Swann, will you please state your name and your present occupation, and residence.

Mr. SWANN. Theodore Swann, president, Federal Phosphorus Co., Birmingham, Ala.

The CHAIRMAN. Mr. Swann, you are an engineer.

Mr. SWANN. No, sir.

The CHAIRMAN. But you have studied the situation at Muscle Shoals and along the Tennessee River for a considerable time?

Mr. SWANN. Yes, sir.

The CHAIRMAN. You claim, or your friends claim for you, that you know nearly as much about the situation down there as anybody. I would like you to state to the committee in your own way just what the condition is, and what the situation is at Muscle Shoals. You will kindly proceed in your own way.

Mr. SWANN. My first connection with Muscle Shoals was when I was sales manager of the Alabama Power Co. in 1913, at which time in my position I collected data as to the possible market for power, should they develop the property which they at that time owned.

At a later date, I started an electric-furnace plant for the production of ferromanganese, in February, 1917, for the purpose of utilizing secondary power, of which the company had a large quantity. I then resigned my position with the Alabama Power Co.

I personally own the controlling interest in this company as well as the Federal Phosphorus Co. We engaged a staff—

The CHAIRMAN (interposing). What do you mean by "this company?"

Mr. SWANN. The Southern Manganese Corporation, which was the company that produced ferromanganese.

We engaged the best technical staff we could find to develop something for the electric furnace to do with secondary power, as the ferromanganese market was being well supplied prior to the armistice; in fact, there was a surplus in this country as was proven by the quick drop in price after November 11th.

The CHAIRMAN. You mean November 11, 1918?

Mr. SWANN. Yes.

The CHAIRMAN. That is the day on which the armistice was signed.

Mr. SWANN. Yes.

The CHAIRMAN. Or went into effect.

Mr. SWANN. Yes. In fact, in New York on the day of the premature announcement, while I was operating eight furnaces on ferromanganese, I wired my plant to shut down three furnaces, knowing that there was too much ferromanganese in the country.

I was in touch all along with the War Industries Board, and Mr. C. H. McDowell, who was the director of the chemical section, suggested that we make potash.

We continued some experiments on the utilization of Georgia shales for producing potash, since our supply was cut off from Germany at that time, and the western fields had not been developed.

We did produce some potash by volatilizing it in the electric furnace; that is, we charged into the furnace a potash-bearing shale, and we produced a product as high as 40 per cent potash, which, at the prices then prevailing, would have been a very profitable business.

A little later, Mr. McDowell suggested the Government would need more phosphorus for smoke-screen and other war purposes, and we took a contract to build a plant for the Government on the basis of cost plus \$1 for the production of large tonnage of phosphorus.

We had not proceeded very far with the plans when the armistice was signed. We, of course, were interested in phosphorus from our studies at that time, and it was further suggested that phosphoric acid could be made in the electric furnace.

The Bureau of Soils had conducted some experiments at their Arlington Farm and later at Hoboken, but only in a limited way with a small furnace. They deserve much credit for their work.

The War Industries Board arranged the loan of one of the representatives of the Bureau of Soils, Mr. J. N. Carothers, who came down to assist on behalf of the Government in getting the plant ready for the production of phosphorus. Later, I secured the services of Mr. Carothers, who came with us to join in this development.

Very briefly speaking, we had a 20,000 kilowatt plant, which is about one-fourth as large; in fact, it is slightly more than one-fourth as large as the Muscle Shoals plant. We did not know what we were going to do with it. We could not continue the manufacture of ferromanganese because the English had come into competition and reduced the price to a very low figure. It could be made in the blast furnace, and there is absolutely no excuse for making anything in an electric furnace unless you can make it of better grade or higher quality than in the blast furnace.

Knowing that, we made studies of every alloy that had been made in the electric furnace, searching for the location of raw materials, the principal points of manufacture, the principal markets, and when we came to phosphate rock, since we are located substantially midway between the Tennessee and Florida deposits, and as the United States has more than one-half of the world's supply of phosphate rock, we decided to confine our experiments to something to do with phosphate rock in order that we might salvage our war-time plant and make it of some use and value; otherwise, we would have to scrap it.

I might say we really had a prize offered us. We built this plant for a total of about \$800,000. It would not scrap for \$150,000. Therefore, if we could find something it could do, we could make it work its cost or a prize of \$650,000 was offered to ourselves if we found something with which to utilize it.

We first started in the production of ferrophosphorus, to learn something of the peculiarities of working phosphate rock.

The experiments conducted by the Bureau of Soils were of value to us but they proved there was considerable technical difficulty in the handling of phosphate rock.

At a later date, we made phosphoric acid; in fact, our first phosphoric acid was made about 2½ years ago. Then we tried the combining of potash-bearing shale from Georgia in the electric furnace with phosphate rock to produce a potassium phosphate.

I might briefly describe the process for making phosphoric acid in the electric furnace. Our furnaces were of the open-top rectangular type, known as the carbide-type furnace, exactly like, except smaller, than the ones you have at Muscle Shoals nitrate plant No. 2.

The capacity of each of our furnaces was 4,000 horsepower, which removed them, of course, from the experimental class.

We charged into the electric furnace, phosphate rock from Tennessee, which is the lump rock, or the Florida pebble rock as our source of phosphorus; then the silica rock which is an acid to flux the excess of a base or lime that is present in the phosphate rock, coke braise as a reducing agent—not the ordinary lump coke, but a cheaper material, coke braise, and then some cast-iron borings. Our purpose in adding the cast-iron borings was to improve the operating condition of the furnace and make some ferrophosphorus which really was our bread and butter while we were developing this process as we had lost a very large sum of money on the decline of manganese, which dropped in a short period of time from \$280 a ton to \$95 a ton; incidentally, one of

the first of the commercial wars, in which the English said they were going to take back the market that they had in this country—and they did.

The phosphorus is evolved as phosphorus by the heat of the electric arc or furnace. When it comes in contact with air in an inclosed furnace, it turns to phosphorus pentoxide, similar to the form in which they use the phosphorus for smoke-screen work. It is a dense, heavy, white fume. That is carried over in the gases and passed through a condenser and precipitator. Being hygroscopic or picking up water easily, strange as it may seem, it comes out of the electric furnace as a liquid. The liquid phosphoric acid that we collect is approximately 65 per cent P₂O₅, which is four times the strength of ordinary acid phosphate as produced by the sulphuric-acid method.

Now, once we obtained liquid phosphoric acid of this high degree of purity and high strength, we naturally sought first the markets that would bring us the best price, which are known as the food-grade markets.

By a simple process of purification, due to the fact that we have a pure acid to start on, we were able to obtain an acid that is suitable in the East for soft drinks and is mixed with either lime or ammonia or soda into a water softener, a boiler compound, or rust-proof compound, or for use by the peroxide blondes by way of the hydrogen-peroxide. There are very many uses for phosphoric acid, and sugar refining is one of them.

We developed that trade and have a fair share of the total business of the United States but always had in mind the fertilizer industry.

Roughly speaking, 25,000 horsepower would produce enough of the high-grade acid to supply the entire requirements of the United States, but to take care of the fertilizer industry on, say, the average of the past 10 years, would take from 400,000 to 600,000 horsepower.

Having once been in the power business, and knowing something of that end of the proposition, I always had in mind trying to find something that could utilize secondary power, knowing that it could be obtained cheap in the South, since the entire Appalachian section is one of seasonal stream flow. The fertilizer business is seasonal, so the two fit in together very well.

The 65 per cent liquid phosphoric acid is used to treat or acidulate, which is the trade name, ground phosphate rock, and a triple superphosphate is produced containing 48 per cent phosphoric acid, or three times that of ordinary phosphate. The ordinary acid phosphate is produced by grinding phosphate rock, treating it with sulphuric acid to make available the phosphoric acid present in the rock.

By our process we first obtain a liquid phosphoric acid out of the rock and then use that element of plant food to liberate more plant food from the raw rock.

We also can take liquid phosphoric acid and fix ammonia gas from the by-product coke ovens into an ammonium phosphate, or take the liquid and fix the gaseous element and collect it as a salt available for use as a fertilizer.

This led up to another interesting experiment in connection with the production of potash and phosphoric acid. In the production of phosphoric acid we charge into the furnace a material for fluxing silica rock, in the production of potash the base being an acid with charged lime. So the natural question that would occur would be, why not charge enough potash-bearing shale into the furnace to satisfy the requirements and produce a potassium phosphate? And on September 12, 1919, we produced this sample of K₂O or potash 7.94, P₂O₅ or phosphoric acid, 66.7. That is true potassium phosphate, and is still a liquid in solution.

If potassium phosphate were produced by this method at Muscle Shoals or elsewhere in the South or West it could be used to fix by-product coke-oven ammonia gas and produce a complete fertilizer of very high concentration. Perhaps it would be necessary to dose it up with a little of the other concentrated fertilizer elements to get the proper plant food value for the different crops.

Now, in reference to the present type of fertilizer, as you have been told, the component parts of fertilizer with respect to the plant food are ammonia, phosphoric acid, and potash. The statistics do not show the exact amount of each used throughout the United States, because they vary, depending on the crop they are used on and the availability of the potash. When our supply was largely cut off, of course, we did not use as much potash or as large an amount of Chilean nitrates; but it is generally accepted that in the South, where a larger part of the fertilizer is used, the average is not far from 3-0-3, as known in the trade, or 3 per cent ammonia, 9 per cent phosphoric

acid, and 3 per cent potash, making a total of 15 per cent plant food and 85 per cent inert material or filler. The variations in the Middle West and the East and so on are slightly different from that, but perhaps that is not far from the general average of the United States.

Now, the natural question comes, why do the fertilizer people, the fertilizer manufacturers, produce a material and ship it that is so low in plant food content as indicated? The answer is rather simple. It is not because they desire to deliberately dilute the product and put in a filler, but by virtue of the process by which they manufacture it.

As in all other things, there must be development. The development that we have made in our process there makes it possible for them to produce a more concentrated fertilizer. Of course, there is still another question: Can you get the farmers to use it? A lot of them have been in the habit of buying something at so much per ton. When you ask them five times as much per ton you are going to have a little difficulty in getting some of them to understand they are not paying five times as much, but getting something that is concentrated. That will come, it is true, but it will be slow. There will have to be a campaign of education.

I think it might be proper to read into the record a statement in the Fertilizer Green Book entitled, "High analysis approved." I want to read just three paragraphs from this and then there are some testimonials from the different State and Government experiment stations. The article reads as follows:

"1. It will effect savings in the cost of manufacture, labor, bags, transportation, handling, storing, etc., because each ton of goods will contain more pounds of actual plant food.

"2. It will reduce the large number of useless, wasteful brands, through the elimination of low-analysis mixtures, thereby simplifying the farmers' fertilizer problems and increasing manufacturing efficiency.

"3. It will enhance the quality and reliability of fertilizers, the direct result of which will be better results in the field."

As I understand it, the problem before this committee is, what to do with the fertilizer situation at Muscle Shoals.

I think we can say with a definiteness that leaves no room for question, that during the last three years and a half of experimentation at Anniston, Ala., where our plant is located, we have positively proven that phosphate rock can be smelted in an electric furnace and phosphoric acid collected for use in the fertilizer industry that will reduce the present costs.

Referring to Prof. Whitney's testimony as to the amount of phosphoric acid that is washed away and left on the dumps at the mines, we have used and can use a much lower grade phosphate rock than can be used in the sulphuric acid method. That alone represents a great saving. For instance, I have an option on one large tailing pond, as they call it, at 50 cents a ton, which will represent a saving to me, when I utilize it, of some five or six hundred thousand dollars versus the cost of mining new rock and carrying it through all the processes to utilize it. That alone is an important point in reducing the costs.

I believe the real point in connection with Muscle Shoals has been missed. You have talked of ammonia in its various forms as being produced there. Ammonia represents only about 2 per cent, or perhaps, a little more, of the total of the plant food used in fertilizer. It seems to me that if you are looking at this from a business standpoint, as to how you can really reduce the cost, you would want to consider also the large element, phosphoric acid, which is from one and one-fourth to one and one-half times the total weight of the potash and the ammonia combined.

I do not know what the experts will say to this statement, but there were certain facts brought out at the hearings on March 22, 1920, from which I obtained this information.

The CHAIRMAN. What bearing was that?

Mr. SWANN. That was before the Senate committee in reference to the production of atmospheric nitrogen at Muscle Shoals.

The CHAIRMAN. What is the document you are referring to?

Mr. SWANN. Hearings before the Senate Committee on Agriculture and Forestry, conducted in 1920.

According to the statistics contained therein, in 1909, by the cyanamid process, there was produced 2,500 tons, by the Haber process, none; in 1913, by the cyanamid process, 60,000, by the Haber, 7,000; in 1917, by the cyanamid process, 200,000, and by the Haber process, 110,000; in 1920 by the cyanamid process, 325,000, and by the Haber, 308,000, showing conclusively that the cyanamid process was not increasing in anything like the relation of the Haber process

I do not pretend to be an expert on the production of ammonia at all, but I am merely taking the figures and, naturally, looking at the Muscle Shoals plant to see what could be done with it and knowing that our furnaces at Anniston were of the same general type as the furnaces at Muscle Shoals, a simple archroof of brick could be put over the furnaces in Nitrate Plant No. 2 and a long brick gas main built, a cooling system and a precipitator built, and phosphoric acid could be produced there in large quantities in that plant, which is well equipped to handle phosphoric acid, since the elements or the raw materials that go into making carbide are lime and coke, and the elements that go into the other material could be handled in the same bins, being phosphate rock, silica rock, and coke breeze.

You would, of course, in that connection, not make ferro phosphorus which we have made.

Then, either by the modified Haber process or some other process which will likely come, you would produce your ammonia and not carry it to the point of ammonium nitrate or ammonium sulphate, but fix the gaseous ammonia into liquid phosphoric acid produced there, and if it was found cheaper to produce your potash than to buy it, charge into your electric furnaces potash-bearing shale from the neighborhood, and there are great tonnages of it, so that you would produce the potassium phosphate as a liquid and utilize that in fixing your gaseous ammonia into a complete, concentrated fertilizer.

Now, with respect to concentrated fertilizer, as I stated before, the farmer may be rather slow to come to it, but I believe in his intelligence, and that when once shown, he will use it, and I do not think that anything can stop the development and the utilization of concentrated fertilizer.

A number of the experts believe that the farmer will use on his soil direct a more concentrated fertilizer, but it is very easy to produce a concentrated fertilizer that will contain from four to five times as much plant food as is now contained in an average ton of mixed fertilizer, ship it to him, even though the average freight rate, perhaps, is not over \$3 or \$3.50 per ton from the point of production to the point of consumption, let him mix that concentrated fertilizer with two or three or four sacks of good dry sand or good dry dirt, and I suppose if he is a dirt farmer he ought to have those products on his farm, and apply those to his soil in the equipment he now has, his farm machinery, which is adapted for spreading a dilute fertilizer on the soil.

This process is adaptable to be used anywhere, where secondary or cheap power is available, and I say secondary because that means cheaper power than primary power, and, of course, should be used if the greatest economy is desired as near the center of consumption as possible.

In carrying on our investigations we have negotiated with the Aluminum Co. of America for secondary power at their Alcoa, Tenn., plant, believing we could make some fertilizer for the section that could easily be served from there. We have had negotiations with an electric furnace company at Chattanooga, who own an electric furnace that is partially idle, and get their power from the Tennessee Power Co. We have had negotiations with the Anaconda Copper Mining Co., who have a large electric furnace plant at Great Falls, Mont., which they built during the war to produce ferromanganese, and which is now shut down, and through an allied company, the Montana Power Co., they have large quantities of power available.

Also, there have been discovered in that section of the West the greatest known deposits of phosphate rock in the world. That phosphate rock has no hope of reaching certain of the present consuming markets, unless it can be sent out in a concentrated form. And, just at this point, without apparently knocking the present method of manufacture, I would like to call your attention to a striking instance of which I do not believe you will find the equal in any other of the great industries. Phosphate rock, as mined, contains about 32 per cent phosphoric acid. After you have treated it with sulphuric acid to make it available to the soil, it has an average of about 16 per cent. By the time it actually gets to the farmer it is cut down in the mixture he gets to about 9 per cent; or the finished material is approximately one-fourth of the raw material originally mined. High freights have brought a lot of that home to us. Many things could be done with lower freight rates that can not be done to-day. High freight rates will relocate many industries, and that is something to be considered. When you try to find out how much fertilizer can be made at Muscle Shoals, you must bear in mind that you could make too much there. It would cost you too much to distribute from that point. There are

other water powers. There are other secondary powers. There are other locations that use it. That is purely a business question, as to the exact location and the tonnage that could be made at that particular location, depending on the assembling of raw materials, the cost of manufacture, and outgoing freights to the point of consumption.

To go into more detail regarding the present method of manufacture and to repeat what I said about the fertilizer manufacturer not deliberately diluting his material, his costs are high because of the fact that he has to use in the manufacture of both acid phosphate and sulphate of ammonia, sulphuric acid, an inert material that does no good, and that will finally sour the soil if too much is used.

For instance, assume the figure is correct that the price of sulphate of ammonia as testified by a previous witness is \$50 a ton, and assume an average price of sulphuric acid of \$12 delivered at the by-products coke-oven plant, the producer of by-product coke-oven ammonia would be just as well off if he could sell to the producer of fertilizer liquid ammonia at \$38 a ton as he would be if he would sell sulphate of ammonia at \$50 a ton. That money is lost. In round figures, the amount of plant food in a ton of ammonium phosphate, which we can produce by this process averaging 13 per cent ammonia and 62 per cent phosphoric acid, you would have to ship 4.35 tons of ordinary acid phosphate and sulphate of ammonia to either the farmer or the fertilizer manufacturer in order that they might get out of it the same amount of plant food.

You will ask: Why have they not used this before, and on what scale are we doing it?

We first developed, as I stated, the food grade market because it brought us a higher price. We needed the money in our developments, and just as this period I think it only fair that I make a statement regarding our company, because of my previous connection with the Alabama Power Co., because I am buying power from them at this time, and of my association with the other companies, a number of them, which are involved in one way or another. I am very glad to say that I have been selling Mr. Ford phosphoric acid which he uses in rust-proofing his cars. I am not only independent but always have been.

The CHAIRMAN. The committee will be very pleased to hear your statement.

MR. SWANN (continuing). Having owned 51 per cent, or the control of my company, and always expecting to; and it has been a development in which, I will say, we have been encouraged by the power company. We have been assisted by them at many times when conditions were hard. We have leaned on their pocketbook a good many times, and we are negotiating with them now for a large block of secondary power from their new dam on the Coosa River; at the same time, we have sold our fertilizer to the fertilizer companies, since we were not producing, up to this time, a sufficient quantity to justify us in having a distributing organization. So you can see that it places me in a very peculiar position, and I have tried to relate to you a few of the fundamental facts in the statement of what has been accomplished. This can be repeated at Muscle Shoals. This can be repeated in Montana, in Georgia, in Tennessee, or elsewhere.

The farmer can get cheaper fertilizer by this process and leave the manufacturer a legitimate manufacturing profit which he must have.

If you will refer to the financial statements of some of the fertilizer companies, you will find they have lost some very large sums of money. I believe the balance sheets of the two largest companies show a loss of above \$20,000,000 last year in the decline in prices, due to the fact that they have to buy their raw materials a long time ahead.

Now, my object is to make the bulk of the money we make out of the food-grade product which we can reduce greatly in value, and to see our process used wherever it is required in the United States for the production of fertilizer. We have a total of 15 patents on it. We have spent a lot of money. We risked everything we had and a few things we did not have in the development of the process. We only expect a very reasonable royalty. We will not burden the industry. We only want a very small part of the saving that can be effected by whoever may want to use this process.

I think this statement will rather clear up any question of my connections or any question as to what our policy may be. I will be very glad to answer any specific questions the committee may desire to ask.

The CHAIRMAN. At the beginning of your statement, or near the beginning of your statement, you spoke of the fact that England had been very active prior to the war and could not extend her industries over the world during the war, but at the end of the war period began to reach out again for the market in this country; do you remember that?

Mr. SWANN. I do; to the tune of \$250,000. That is what I lost in the decline of manganese when we had tried to do what the Government wanted us to do in keeping a stock of manganese ore ahead.

The CHAIRMAN. Is there no provision of any American law that will protect the American producer in that regard?

Mr. SWANN. I personally appeared before the Federal Trade Commission and we tried to invoke an old antidumping law, and got away with it for a short time, but it did not hold in court. They were selling in the United States cheaper than they sold in England or on the continent.

The CHAIRMAN. They were, at that time?

Mr. SWANN. Yes.

The CHAIRMAN. Is there any protection so far as the tariff is concerned?

Mr. SWANN. No. There is a tariff proposed but not enacted.

The CHAIRMAN. That is being proposed in the bill which is still pending in the Senate committee?

Mr. SWANN. Yes.

The CHAIRMAN. And that will give protection if it is enacted into law?

Mr. SWANN. Yes.

The CHAIRMAN. You said something about concentrated fertilizer and the difficulty of getting the farmers to use it. The farmer, I take it, from what you and others have said, is accustomed and has been accustomed for some time to purchase fertilizer which contains quite a good amount of filler.

Mr. SWANN. Yes.

The CHAIRMAN. Of course, he pays the freight on that, and not only pays the freight but pays for the service of packing it in bags or boxes, whichever way it is shipped, and that is all an added expense, I take it.

Mr. SWANN. Yes; and when he finds out the cost of packing and of freight and of bags and of handling, he will certainly turn slowly but surely to the more concentrated fertilizers. The farm bureaus and the county demonstration agents and so on will carry that propaganda on, and I believe a market will be found for the concentrated fertilizers about as fast as they are developed. Prof. Whitney went one step beyond what I have suggested, which I think will apply to certain crops, and that is, they will take this concentrated fertilizer, dissolve it in water, and spray some of it or put it on with a sprinkler. That is perfectly feasible in truck farming especially, where they utilize a large tonnage of fertilizer per acre.

The CHAIRMAN. You have explained what I wanted to ask you about. Do you feel it will be very difficult to show the farmers of this country the benefits that will accrue to them if they utilize the concentrated fertilizer rather than the stuff that is being sold to them containing great quantities of filler?

Mr. SWANN. It will be difficult. It is always difficult to get any one great class like the farmers to change and break away from things they are used to. We are all more or less creatures of habit, but they will do it. Some of them are now buying their own fertilizers and mixing it, and I would like to explain one point in that connection. If a farmer buys acid phosphate to day, and, say sulphate of ammonia or Chilean nitrates for his ammonia, and kainite or muriate of potash from Germany for his potash, and attempts to mix those together, there is a difficulty for him unless he has a certain amount of technical training, to mix them in the proper proportions; and the method we propose is to send it to him ready mixed in the concentrated fertilizer, and to use the expression of one of the gentlemen of the committee, have him buy it just as he goes to the drug store and buys some medicine which says, "Take two tablespoonfuls in half a glass of water three times a day." We will put on the sack, "Mix this with four sacks of dry dirt." and then if he wants to pay more for the package goods, put your filler in and sell it to him. Sooner or later he will learn how. In offering some of our products, we found they objected to the concentrated form, and then we said, "We will give you 16, 32, or we will give you 48 per cent." but, in that case, we charged for putting in the filler, because we had to put it in.

The CHAIRMAN. Of course, that created additional work.

Mr. SWANN. Certainly; if they want to pay for it, it is their loss and misfortune. Now, it will take time to correct that condition, but I have enough

confidence in the intelligence of the farmer and the experimental stations and the county agents, etc., to believe it will come about as fast as the demand and the supply of concentrated fertilizer is made available.

The CHAIRMAN. Out in California we have extension lessons that are given to farmers by both of our great universities, the University of California, and also the Leland Stanford, jr., University, so that the professors go direct to the farmers and instruct them in regard to these matters. Is that done in this country very generally?

Mr. SWANN. Oh, yes; it is done very generally.

The CHAIRMAN. And are the meetings well attended by the farmers?

Mr. SWANN. Yes; I think they are.

The CHAIRMAN. Do you not think if that course is pursued generally, the farmer will get used to using the concentrated fertilizer very much quicker than he would otherwise?

Mr. SWANN. I do. The head of one of the farm bureaus last night told me that as soon as concentrated fertilizer was available that through his and other organizations a propaganda would be carried on so that the farmer would realize the benefits that would come to him, and there would be a market made available to absorb the tonnage, and I believe that is true.

The CHAIRMAN. You say, "as soon as the concentrated fertilizer becomes available"?

Mr. SWANN. Yes; it is not available to-day in large quantities. As in any new process, it takes time to develop it. For almost a year after we made our first experimental phosphoric acid we could not repeat the results we obtained on a small scale. There was more grief than I would like to tell you about. I could write 10 volumes on what not to do and put on about 2 pages all the things we know how to do.

Mr. GREENE. Do you have any suggestions to make or testimony to offer relative to the terms of the Ford proposition, Mr. Swann?

Mr. SWANN. I have not, Mr. Greene. As I tried to explain my position, we have attempted to develop the process for making concentrated fertilizer, having been connected with and known of the Muscle Shoals proposition for over 10 years; I have always believed it would be developed by some one. I did not know by whom or how it would be operated. I do not suppose any of us know now.

Mr. GREENE. Then, your testimony runs to the advisability of having a concentrated fertilizer for the farmers rather than to the specific details of this Ford proposition?

Mr. SWANN. I am simply trying to show that we have accomplished the thing that is talked about, and that it can be utilized there and elsewhere, and I trust our process is used, whoever gets it.

The CHAIRMAN. I want to say to the gentlemen of the committee that we have another gentleman here who is ready to testify before us this afternoon, and I feel that if we will just ask questions of the witness and eliminate speeches and things of that sort, we will get along very nicely. I want to say that I did not mean that for Mr. Greene, but this morning we had a little example of how far we can go without getting anywhere, and I would like to get through as speedily as we can.

Mr. HULL. Mr. Swann, following the line of the questions asked by Mr. Greene, then it is your opinion that if we make this contract with Mr. Ford or something similar to it, he could develop this process which you speak of for making concentrated fertilizers?

Mr. SWANN. He would not have to develop it; it is already developed. It could be utilized.

Mr. HULL. He could utilize it, then?

Mr. SWANN. Yes.

Mr. HULL. It might be developed further.

Mr. SWANN. Oh, it will be developed further as the development goes on, of course.

Mr. HULL. That is what I had in mind.

Mr. SWANN. But it is developed to the point now that makes it available.

Mr. HULL. Then does it not conclusively follow that he will be able to cheapen fertilizer to the farmer very materially?

Mr. SWANN. With the price of power suggested, there is no question but what fertilizer can be produced cheaper.

Mr. HULL. Now, just one other question. You seem to place a great deal of emphasis, and I think we all do, on the fertilizer end of this proposition. How-

ever, I want to call your attention to the fact that fundamentally this is a question of national defense, and the question of the fixation of nitrates is what this committee is primarily trying to solve. It is solved, as I understand it, in plant No. 2. We have the plant there and we want to keep it. Now, the question comes up, if Mr. Ford develops along the line you have suggested, would the fixation of nitrate be maintained in plant No. 2?

Mr. SWANN. Of course, I can not answer what he or anyone else would do. I can only say from the knowledge I have I do not believe ammonia for fertilizer can be made as cheaply by the cyanamid process as it can be obtained from other sources.

Mr. HULL. Yes; but you are speaking of ammonia for fertilizer.

Mr. SWANN. Yes.

Mr. HULL. We are speaking of ammonium nitrate for high explosives. That is the question we have got to solve primarily.

Mr. SWANN. If your plant is there, of course, it is available.

Mr. HULL. And in order to follow this line of development, it would not be necessary to destroy what we have, would it?

Mr. SWANN. No.

Mr. HULL. That is the point I had in mind.

Mr. SWANN. I did not make complete my statement a moment ago. Should it be desirable from an economic point of view and from the point of view of getting low costs, which, of course, must come, you could convert these furnaces over to phosphoric acid furnaces, and I should say that two weeks' time would be all that would be required to convert them back to carbide furnaces. All you would have to do would be to tear the roof off and put in a new lining of carbon blocks, and if you wanted to keep prepared, you could keep on hand a stock of carbon blocks sufficient to line all the furnaces again.

Mr. HULL. That is the answer I wanted. I thank you.

Mr. CROWTHER. Mr. Swann, you said you had some acquaintance with the conditions at Muscle Shoals, having been with the Alabama Power Co. They owned the site of Dam No. 2 or the Wilson Dam, did they not?

Mr. SWANN. Yes, sir.

Mr. CROWTHER. And they disposed of that to the Government for a small consideration?

Mr. SWANN. It is my understanding they gave it to the Government. That is my understanding but I am not exactly informed on that.

Mr. CROWTHER. You do not know about that. What is ferromanganese used for?

Mr. SWANN. It is used in the production of steel. Every ton of steel must contain a certain percentage of manganese and especially shell steel contains more than the general run of steel.

Mr. CROWTHER. Is it not true that in the early part of the Sixty-sixth Congress we introduced in the House a special bill in connection with five or six other small bills to protect that material from a tariff point of view, as a war industry.

Mr. SWANN. Yes.

Mr. CROWTHER. And that was one of the bills criticised as popgun legislation or popgun bills by Mr. Kitchen who was on the floor at that time, and it did not meet with any very favorable consideration, and tungsten, if I remember correctly, was another product, and several other things.

Mr. SWANN. Yes.

Mr. CROWTHER. You spoke of the sprinkling method of using fertilizer. I think I brought that out by asking Dr. Whitney whether the two ingredients he has submitted were soluble in ordinary water and he said yes. There is nothing new about that?

Mr. SWANN. Absolutely nothing new.

Mr. CROWTHER. The old fertilizers and the natural fertilizers have been sprinkled and distributed that way on the soil for many years, have they not?

Mr. SWANN. That is correct.

Mr. CROWTHER. Do you think that is a pretty good method to use?

Mr. SWANN. In some instances it might be a very good way, especially if you bought your fertilizer originally in a concentrated form.

Mr. CROWTHER. Are these synthetic compounds?

Mr. SWANN. Your ammonia, perhaps, would be called a synthetic compound.

Mr. CROWTHER. What have you to say about Dr. Whitney's statement that after a 10-year period of treatment with these compounds or these artificial fertilizers, the crop growth showed a gradual increase up to 10 years and then they went

down in direct proportion to the soil that had had no treatment at all. You will remember that he spoke of that?

Mr. SWANN. Yes.

Mr. CROWTHER. Have you any knowledge on that subject?

Mr. SWANN. I have no direct knowledge on that subject.

Mr. CROWTHER. He spoke as if they were hurting the soil with these artificial ingredients because after 10 years the crops deteriorated in just the same proportion that crops deteriorated on soil year after year that had had no special fertilizer and no special attention given to it, and I think he spoke of the distinct advantage of the natural forms of nitrogen that were produced by rotation of crops and by plowing in certain crops, as being perhaps the ideal system. I was just wondering if you had anything to say on that. That is all.

Mr. FIELDS. In your opinion, Mr. Swann, there is no question but what it will be possible to get fertilizer to the farmer in concentrated form, so he can use it and apply it to the soil without the expense of the large amount of filler that is carried to-day.

Mr. SWANN. That is our opinion and we have backed it up with our money in the last three years and a half.

Mr. FIELDS. I am mighty glad to hear you say that, and I will say, Mr. Chairman, that what he has said and shown here is what I had in mind the other day when I asked the Chief of Ordnance about the possibilities of concentrated fertilizers. You say there are heavy deposits of phosphate rock in Montana?

Mr. SWANN. Yes.

Mr. FIELDS. And in what other sections of the country?

Mr. SWANN. The principal sections are the Tennessee lump rock, which is very near Muscle Shoals, and the deposits in Florida. There is a little bit in South Carolina but the principal point of production is Florida, Tennessee coming next. The western deposits are large but the market is not very great. They are too far from market now.

Mr. FIELDS. So the fertilizer will have to be manufactured in those sections, and when that is done, it will save freight rates to the farmers in those sections of the country?

Mr. SWANN. Yes.

Mr. FIELDS. I do not want to make a statement, Mr. Chairman, but I do want to refer to one or two questions you asked a moment ago about the professors of the colleges in your State. I suppose every State in the Union, certainly every one I know of, is working with the Federal Government in what they call farm demonstration work.

The CHAIRMAN. Extension courses, they call them in California.

Mr. FIELDS. They do not come in contact with all the farmers, but they do come in contact with the most progressive farmers of the counties, and the elimination of the heavy expense incident to freighting and handling the amount of filler that we get in fertilizer to-day is a crying need of the farmers. They all realize the necessity of relief from that expense. That is all, Mr. Chairman.

Mr. QUIN. Mr. Swann, you have from actual experience of manufacture, the knowledge of this subject which you have just detailed to this committee, as I understand it.

Mr. SWANN. Yes.

Mr. QUIN. Then it is not any dream that concentrated fertilizer can be produced and turned over to the farmer?

Mr. SWANN. No, sir.

Mr. QUIN. The gentleman who contended that it was impossible unless you had about 80 per cent of filler is in error, is he not?

Mr. SWANN. By these samples we can demonstrate that.

Mr. QUIN. From practical demonstration by your own factory, there is no doubt but what concentrated fertilizer can be sent out and economically sent out from the factory to the consumer?

Mr. SWANN. I have no doubt about it; no.

Mr. QUIN. As you stated, the expense of this so-called filler, this sand or dirt, and the expense of putting it into sacks and storing it in warehouses and the expense of high freight rates, adds materially to the cost of the fertilizer sent in bulk with all that filler, does it not?

Mr. SWANN. Yes; and not only that, but, as I stated before, they do not add the filler, but by the process of making it with sulphuric acid the filler is produced. So you have an additional cost. It is more expensive even than if you

did add it, because filler would not cost as much as sulphuric acid, the material they use to make available the phosphoric acid in the rock and to fix the ammonia and the ammonia gas.

Mr. QUIN. A fertilizer factory at Atlanta, Ga., Jackson, Miss., or New Orleans, La., gets its gross products in as concentrated form as possible?

Mr. SWANN. Yes; the way the rock is mined, they do. They get as high grade as they can get.

Mr. QUIN. And still the expense on all of that gross product in shipment and handling must be paid by the ultimate consumer of the fertilizer?

Mr. SWANN. Yes.

Mr. QUIN. Then as a practical and sensible thing for the farmers directly, and for all the people who consume farm products indirectly, it is necessary to give them cheap fertilizer, or as cheap as possible, is it not?

Mr. SWANN. Naturally.

Mr. QUIN. In the Ford contract he proposes to put this fertilizer up to 110,000 tons, and that means if they add a filler to it in proportion, it would be about 2,000,000 tons of fertilizer ready to go on the soil.

Mr. SWANN. I think that was the figure given. Of course, the amount of nitrogen or ammonia varies in the different fertilizers and that question can only be definitely answered when you state the formula, but that is about correct; yes.

Mr. QUIN. The question of potash was mentioned by you. Is it possible to get potash economically from any source around Muscle Shoals?

Mr. SWANN. At the present time you can buy German potash cheaper than you could produce it.

Mr. QUIN. What sources of potash have we in the United States?

Mr. SWANN. Well, there is the kelp in the western States, and the natural brines in Nebraska and the by-product from the cement mills, as well as wood ashes and various miscellaneous, small sources.

Mr. QUIN. The great potash field at present is the quarries of Germany?

Mr. SWANN. At the moment it can be bought cheaper than it can be produced at most places. I am not competent to state the cost of the western producer. I believe they asked for a tariff for a short period, and at the end of that period they claim they will be in position to compete with the natural sources of potash.

Mr. QUIN. Would you mind giving us for the benefit of the record, what is potash?

Mr. SWANN. Well, potash is an element of plant food, the same as phosphoric acid or ammonia. It is one of the three elements that go into fertilizer.

Mr. QUIN. And it is one of the essential things for certain plants and certain soils where the soil does not produce it?

Mr. SWANN. Yes.

Mr. QUIN. And it comes from the decomposition of animal and vegetable matter on the soil, does it not?

Mr. SWANN. That contains some of the other elements also.

Mr. STOLL. Mr. Swann, what element of fertilizer do we get from the coke ovens?

Mr. SWANN. Ammonia.

Mr. STOLL. Will the process you have mentioned interfere with their business?

Mr. SWANN. Not in the least, and as I have explained, they buy approximately 1 ton of sulphuric acid to fix the equivalent of a ton of sulphate of ammonia. That ton of sulphate of ammonia as shipped out contains about 25 per cent ammonia. The other 75 per cent is the salt from the sulphuric acid, a wrapper or a filler or a carrier, or whatever you want to call it.

Mr. STOLL. Which of the three elements we have in our fertilizer is the scarcest in this country?

Mr. SWANN. I should say that depends entirely on the crop and what you want to use it for. Of course, we have more phosphoric acid than any of the other elements, except that if ammonia or nitrogen is made from the air, I assume we have our share.

Mr. STOLL. Is it a fact that ammonia is the scarcest?

Mr. SWANN. At the present moment, all of it is a drug on the market. We are exporting. We always do export considerable phosphate rock, and we are exporting sulphate of ammonia now, and of course, import some of our potash.

Mr. STOLL. The use of fertilizer now is not nearly as extensive as it was years ago on account of the high prices and on account of everything going to the "bowwows;" is not that true?

Mr. SWANN. That is true.

Mr. STOLL. In normal times, is not ammonia the scarcest article?

Mr. SWANN. I do not think so.

Mr. STOLL. Well, what is the scarcest?

Mr. SWANN. In normal times there is plenty of each available. I do not know that you could pick out one as the scarcest.

Mr. STOLL. And there is an abundance of each?

Mr. SWANN. There has been a rapid development of the by-product coke ovens and one of the things worrying them is how they are going to dispose of the ammonia.

Mr. STOLL. Do you mean that there is an abundance of ammonia without getting it from the air?

Mr. SWANN. No; I would not say that. As Prof. Whitney has pointed out we should be using about 10,000,000 tons of fertilizer instead of dropping back to—I do not recall his figures, but I think it was 5,500,000 tons that we used last year.

Mr. STOLL. What I wanted to get at was this: In order to get the supply of ammonia we need, we are dependent upon the atmosphere to get it, are we not?

Mr. SWANN. Some of it, yes; I should say.

The CHAIRMAN. We are very much obliged to you, Mr. Swann, for your very clear statement. It has been a great pleasure to hear what you have said.

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Monday, February 20, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. On February 3 Mr. K. F. Cooper, vice president of the American Cyanamid Co., and, as I understand it, the head of the Air Nitrate Corporation, sent me this telegram:

Hon. JULIUS KAHN,

*Chairman Committee on Military Affairs,
House of Representatives, Washington, D. C.*

Air Nitrates Corporation requests opportunity to be heard by your committee on any proposal affecting United States nitrate plant No. 2 at Muscle Shoals and particularly regarding reported plan to violate rights of this company under contract of June 8, 1918, with United States Government.

K. F. COOPER, *Vice President.*

I may say that he is also vice president of the American Cyanamid Co. To that I replied that he would be given a hearing at the proper time, and on February 8 I received this letter from him:

AIR NITRATES CORPORATION,
New York, February 8, 1922.

Hon. JULIUS KAHN,

*Chairman Committee on Military Affairs,
House of Representatives, Washington, D. C.*

DEAR SIR: This acknowledges with thanks receipt of your courteous note of February 4 advising us that we will be given an opportunity to present before your committee a statement regarding the Muscle Shoals matter.

Awaiting your further advice as to the date when it will best serve the convenience of your committee to have us appear, we remain,

Yours, respectfully,

K. F. COOPER, *Vice President.*

A few days ago I sent Mr. Cooper a telegram asking him to appear this morning for the purpose of giving his testimony before the committee, and he wired back that he would send down Mr. Hammitt, of his company, who is thoroughly familiar with the situation. Mr. Hammitt is here this morning and we will be very glad to hear from him on this subject.

STATEMENT OF MR. J. O. HAMMITT, VICE PRESIDENT AIR NITRATES CORPORATION, 511 FIFTH AVENUE, NEW YORK.

The CHAIRMAN. Mr. Hammitt, will you kindly give your name and also the position you occupy at the present time?

Mr. HAMMITT. My name is J. O. Hammitt. I am vice president of Air Nitrates Corporation which designed and built United States plant No. 2, commonly known as the Muscle Shoals nitrate plant.

Air Nitrates Corporation is a subsidiary of the American Cyanamid Co. Air Nitrates Corporation has a purely nominal capitalization of \$1,000, all of which is owned by the American Cyanamid Co. The real party in interest is the American Cyanamid Co., whose stockholders have all the beneficial interests in what rights are possessed by Air Nitrates Corporation, and in order to avoid confusion the committee may consider me here as the representative of the American Cyanamid Co. or of Air Nitrates Corporation in case any questions arise affecting either of those two companies.

The identity of the two companies is practically one, and the reason why Air Nitrates Corporation was created at all was twofold: First, to serve the purposes of the United States Government; and second, to protect the interests of the stockholders of the American Cyanamid Co.

The Government desired to have a plan set up by which all of the accounts, all of the expenditures, all of the activities relating to the design and construction of this nitrate plant and other nitrate plants it desired to have built to use the same process, should be subject to supervision, examination, inspection, and audit by the representatives of the Government, and for the purpose of making that as simple and inexpensive and effective as possible, it was desired that a separate corporate entity be set up to handle this particular job so as not to mix any of these matters with the other business of the American Cyanamid Co.

The American Cyanamid Co. also desired that a separate corporation should be created in order that the assets of the American Cyanamid Co. should not be in any way involved in connection with the construction of these nitrate plants, amounting, before we got through, to approximately seven times the total assets of the company.

The reason we appear before the committee is that the acceptance by the United States of the offer of Mr. Henry Ford for the acquisition by him of the nitrate plant and water-power property at Muscle Shoals violates the solemn and binding agreement of the United States Government entered into with our company under date of June 8, 1918, and I think there is now on the desk of each member of the committee a copy of the contract referred to, and on page 17 of that contract is article 19, which is the particular article to which I refer, and which would be violated by the acceptance of the offer of Mr. Ford.

This article reads:

"Sale of plants.—If upon cessation of this war, or for any other reason, the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made, to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

The agent referred to in this contract and in the paragraph and in the paragraph I have read is Air Nitrates Corporation, which I represent. The plants referred to in this paragraph include the Muscle Shoals plant, United States nitrate plant No. 2.

The contract is signed in behalf of the United States by Col. Samuel McRoberts, representing the Ordnance Department.

The existence of this contract, as a binding obligation of the United States, standing definitely in the way of an acceptance of the proposal being considered by the committee, is recognized in the report of the Chief of Ordnance, dated January 28, 1922, which has been transmitted to the committee and is in its records.

The CHAIRMAN. Was this contract signed by anybody on behalf of the Cyanamid Co.?

Mr. HAMMITT. It was signed by Mr. Frank S. Washburn, as president of the Air Nitrates Corporation and there is a separate contract entered into between the United States and the American Cyanamid Co., and further, a contract between the American Cyanamid Co. and Air Nitrates Corporation, making up the complete scheme which was set up for the work upon the nitrate plants.

The Secretary of War and the Chief of Ordnance have stated their view to the committee, that having entered into this agreement the United States should live up to it.

The Acting Judge Advocate General of the Army, however, has submitted to the Secretary of War an opinion to the effect that since no authority existed for the sale of the plants at the time this contract was entered into, this particular provision of the contract is null and void.

Now, it is not my intention to attempt to make a legal argument before the committee; but I wish that the committee would understand that we have not been guilty of any neglect in seeing that these legal questions which might arise were passed upon before, rather than after, the contract was entered into.

This was a very important provision of the contract. From the point of view of the stockholders of the American Cyanamid Co., it was necessary that

some kind of protection be provided against the plant which we were to design and erect for the Government during the war, being used after the war for the purpose of destroying the company responsible for its design and construction; and so we desired to obtain the very best legal advice that we could obtain in order that the provision to protect the stockholders of the American Cyanamid Co., as placed in the contract, should always hold; and after consulting the representatives of the Government and ascertaining that it was satisfactory to them for us to retain Mr. Charles Evans Hughes, the present Secretary of State, in connection with this question, we retained Mr. Hughes for that purpose.

Now, I was not personally present in the conferences in which the provisions of this contract were agreed upon, but I can state to the committee that Mr. Hughes was present in the conference where this matter was considered, and that it was on the strength of his advice that this form of protection was provided for the American Cyanamid Co. in the terms of this section.

The CHAIRMAN. That is, section 19?

Mr. HAMMITT. Article 19 of the contract; yes, sir. It is our belief that the advice which was satisfactory to us and satisfactory to the Government, at the time, was sound advice; that this provision of the contract will hold in the courts; but we set up that it is unfair to put us in conflict with the United States Government on this matter and to make us wend our weary way through the law courts for a period of years in order to establish this right. The appeal I wish to make to this committee is not based upon the question of whether that contract is valid or not, whether that provision is null and void on account of some technicality, or whether it is binding. That question, if it must be settled on that ground, will have to be settled in the courts; but my appeal to this committee is an appeal to the fairness of the committee and to the support of the public policy in favor of the United States Government living up to its agreements.

Here is the situation that led those who made that agreement to believe that it was fair that that kind of protection should be provided.

The American Cyanamid Co. had devoted years of effort and millions of dollars of the money of its stockholders to acquiring patent rights, developing processes, in expensive research, in the design and construction of plants, and the placing of those plants in operation, and in the difficult, time-taking and expensive work of introducing new products into American commerce and finding a stable place in American commerce for those products; and then came the war with Germany, and the only company, the only organization on this side of the Atlantic Ocean that was engaged in fixing nitrogen on a commercial scale was the American Cyanamid Co.

It had not been then, and it has not been up to now, a marvelously profitable operation. The American Cyanamid Co. has succeeded in paying the 6 per cent dividends on its preferred stock with the exception of the last two quarterly payments, and it has never paid a penny of dividends on its common stock; but it was a contribution to American industry and there was a hope in it that the money that had been invested in it could be got out.

The United States Government needed this process for the purpose of manufacturing ammonium nitrate, a war explosive; and the American Cyanamid Co. was called upon to place its processes, its experience, its knowledge of the art that had cost large sums of money to acquire, and years of efforts, at the disposal of the United States Government for fighting the war; and, of course, the American Cyanamid Co. was desirous of doing that, as every American corporation capable of contributing anything toward winning the war, was desirous of contributing everything it had. But while we would have been very poor patriots if we had not been willing to give the Government everything we had to help toward winning the war, we would not only have been very poor business men but guilty of a violation of our trust to our stockholders, if we had not asked for protection against the use, after the war, for the purpose of destroying us and the investments of our stockholders, of the plants that we were to build for the Government during the war and which without our cooperation could not have been designed and built.

Now, we might have asked for protection in a number of different ways. It might have been asked that after the war these plants be destroyed, but the Government desired that these plants should be maintained permanently or at least indefinitely as a protection against future war emergency, and so they were built as permanent plants, and we put into them every bit of

The identity of the two companies is practically one, and the reason why Air Nitrates Corporation was created at all was twofold: First, to serve the purposes of the United States Government; and second, to protect the interests of the stockholders of the American Cyanamid Co.

The Government desired to have a plan set up by which all of the accounts, all of the expenditures, all of the activities relating to the design and construction of this nitrate plant and other nitrate plants it desired to have built to use the same process, should be subject to supervision, examination, inspection, and audit by the representatives of the Government, and for the purpose of making that as simple and inexpensive and effective as possible, it was desired that a separate corporate entity be set up to handle this particular job so as not to mix any of these matters with the other business of the American Cyanamid Co.

The American Cyanamid Co. also desired that a separate corporation should be created in order that the assets of the American Cyanamid Co. should not be in any way involved in connection with the construction of these nitrate plants, amounting, before we got through, to approximately seven times the total assets of the company.

The reason we appear before the committee is that the acceptance by the United States of the offer of Mr. Henry Ford for the acquisition by him of the nitrate plant and water-power property at Muscle Shoals violates the solemn and binding agreement of the United States Government entered into with our company under date of June 8, 1918, and I think there is now on the desk of each member of the committee a copy of the contract referred to, and on page 17 of that contract is article 19, which is the particular article to which I refer, and which would be violated by the acceptance of the offer of Mr. Ford. This article reads:

"Sale of plants.—If upon cessation of this war, or for any other reason, the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made, to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

The agent referred to in this contract and in the paragraph and in the paragraph I have read is Air Nitrates Corporation, which I represent. The plants referred to in this paragraph include the Muscle Shoals plant, United States nitrate plant No. 2.

The contract is signed in behalf of the United States by Col. Samuel McRoberts, representing the Ordnance Department.

The existence of this contract, as a binding obligation of the United States, standing definitely in the way of an acceptance of the proposal being considered by the committee, is recognized in the report of the Chief of Ordnance, dated January 28, 1922, which has been transmitted to the committee and is in its records.

The CHAIRMAN. Was this contract signed by anybody on behalf of the Cyanamid Co.?

Mr. HAMMITT. It was signed by Mr. Frank S. Washburn, as president of the Air Nitrates Corporation and there is a separate contract entered into between the United States and the American Cyanamid Co., and further, a contract between the American Cyanamid Co. and Air Nitrates Corporation, making up the complete scheme which was set up for the work upon the nitrate plants.

The Secretary of War and the Chief of Ordnance have stated their view to the committee, that having entered into this agreement the United States should live up to it.

The Acting Judge Advocate General of the Army, however, has submitted to the Secretary of War an opinion to the effect that since no authority existed for the sale of the plants at the time this contract was entered into, this particular provision of the contract is null and void.

Now, it is not my intention to attempt to make a legal argument before the committee; but I wish that the committee would understand that we have not been guilty of any neglect in seeing that these legal questions which might arise were passed upon before, rather than after, the contract was entered into.

This was a very important provision of the contract. From the point of view of the stockholders of the American Cyanamid Co., it was necessary that

I make my appeal to the fairness of the committee and to the public policy in behalf of the United States Government living up to the agreements it has made. The committee may have in mind the fact that it is dealing now with a corporation which has not been paid in other coin for anything that it contributed toward winning the war.

That finishes the statement I came here to make, Mr. Chairman.

The CHAIRMAN. I presume that when you began to negotiate with the officers of the Government regarding your help in putting up nitrate plant No. 2, you were familiar with the law that was on the statute books and had been enacted on the 3d of June, 1916. There was a clause in that law which reads as follows:

"The plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital."

You were familiar with that, I imagine?

Mr. HAMMITT. I am quite sure that our attorneys were familiar with that provision and other provisions of law affecting this situation; and I am quite sure, Mr. Chairman, that if it were absolutely certain that that provision of law would always remain the same, it would have been useless to make any provision to cover a possible sale of the plant, but what the committee has before it now is a proposition to change that provision of the law and what the United States Government agreed to was that if that provision of the law ever was changed so that they ever did offer the plant for sale, we should have an opportunity, not on better terms, but on as good terms as anybody else, to acquire the plant.

The CHAIRMAN. You say the Government wants to change the law. Do you consider that if the Government desires to sell the plant outright to private individuals that that would be a change of the law?

Mr. HAMMITT. I would rather not testify, Mr. Chairman, regarding any question of legal interpretation; at least, without first taking the committee into my confidence to the extent of saying that I am not a lawyer.

The CHAIRMAN. You have stated your case very well.

Mr. HAMMITT. The committee would not care to take my judgment on any legal question, Mr. Chairman. If there is anything that the chairman or the members of the committee wish me to express an opinion on, having first stated that my opinion on a legal matter is of no value whatever, of course, I would be very glad to answer it.

The CHAIRMAN. The committee has been hearing this matter discussed from several viewpoints, and I think Gen. Williams stated to the committee he thought that despite that provision of the law, your company had a moral obligation; is that the way you feel about it?

Mr. HAMMITT. I feel there certainly exists a moral obligation, and I am advised and believe that there exists also a legal obligation. I came here to discuss the moral obligation, Mr. Chairman, because, quite obviously, the Judge Advocate General having passed upon the legal obligation, if the committee does not recognize any moral obligation, we may have to determine the legal obligation in the courts, and that is a thing that we want absolutely to avoid.

The CHAIRMAN. This is the evidence before the committee:

"The CHAIRMAN. We will ask the Judge Advocate General about that when he makes his statement. State why, in your opinion, there is a moral obligation?"

"Gen. WILLIAMS. The Government found itself very greatly in need of power. The Alabama Power Co. had already projected this extension, and all their plans had been drawn, and they came to the assistance of the Government at a critical time, putting at its disposal their facilities and the plans which they had already made.

"The CHAIRMAN. And those facilities and plans were accepted by the Government?"

"Gen. WILLIAMS. They were accepted by the Government.

"The CHAIRMAN. And have been used ever since by the Government, have they?"

"Gen. WILLIAMS. They were used for a while by the Government in the operation of the plant at Muscle Shoals"—

And so forth.

Mr. PARKER. That refers to the Alabama Power Co.

knowledge and experience and skill that we had, and we delivered to the United States Government a plant that operates, that meets the requirements for which it was designed, and we did not fall down on our part of the agreement.

We might have asked that it be definitely agreed that these plants never be used for any purpose except the manufacture of war munitions, but it was desired that these plants being built as permanent plants, steel frames, masonry constructed buildings, heavy machinery, should be available for any possible future economic use in the manufacture of fertilizers and other materials, and so what did we obtain from the Government in the way of protection? We obtained merely this: That if the Government ever does sell the plant, it gives us the first chance to buy it, not on any better terms than it is willing to give to somebody else, but on precisely as good terms; and now it is proposed that a man who had nothing whatever to do with putting down there at Muscle Shoals what is there, who had nothing whatever to do with the development of the processes that are capable of being used there, who has contributed nothing to meet the Government's war problem as it is met at Muscle Shoals, shall receive a fee simple title to this plant from the United States Government, and along with it the cheapest power on the American continent, financed out of the American Treasury, for the purpose of carrying on a war of extermination against the company that designed and built that plant.

Now, if that does not shock the sense of justice of this committee, I am very seriously mistaken. Frankly, if the American Cyanamid Co. or any of you gentlemen in your private business, having made a solemn agreement of this sort, and on the strength of it induced a corporation to expose itself to hazards to the extent that the American Cyanamid Co. has exposed itself, then on account of a legal technicality endeavored to escape from that contract, we, or you, would find that people would not care to deal with us in the future, and if they did deal with us, they would deal with us at arms length; and I can not see why there is any public policy in favor of the United States Government showing a lower standard of business morality than is essential for a private corporation, if the corporation is to stay in business in the United States.

Now, the Air Nitrates Corporation and the American Cyanamid Co. have not made one penny of profit out of the contract to which I referred, or out of the designing and construction of this plant at Muscle Shoals. The record of the committee contains references to a \$2,000,000 fee. There was not any \$2,000,000 fee. There was a maximum fee provided of \$1,500,000, but that was not money that the American Cyanamid Co. or the Air Nitrates Corporation was permitted to receive and keep. Suppose that was a fee in the ordinary sense. We did \$100,000,000 worth of work for the Government.

In your general business experience, have you gentlemen had acquaintance with contracts of that character where for design and construction the fee is less than 1½ per cent? It would have been a reasonable fee, but it was not a fee in the sense that we were to receive it and keep it. We have not received it all yet, but let us assume that we do receive it all. In the first place, we are required to pay 80 per cent of it back to the United States Government in taxes, and that reduces your \$1,500,000 down to \$300,000, and that is not 1½ per cent but 0.3 of 1 per cent. Then the State of New York provides under its laws that we must pay approximately \$75,000 of that to the State of New York in taxes, and that reduces the \$1,500,000 down to \$225,000, and then this contract itself provides that we are to deliver to the United States Government without charge the full services for the period required of the men in whom there resided to a greater extent than in any other group the knowledge and the experience and the skill and the ability for the design and operation of that kind of a plant, and we paid those men their compensation out of private funds, and it amounted to more than the balance that was left to us out of our fee, although it amounted to less during that period than we have paid since then for a similar period to the same men for their services out of the same private funds. Then there were a considerable number of expenditures which it was necessary to make on this job, if we were not to fall down on the job, which it was practically impossible for the United States to reimburse, and which the United States not only has not yet reimbursed but a considerable part of which they never will reimburse. And, gentlemen, while I can not tell you the extent of the cash loss, because the details have not yet been fully adjusted, yet I can tell you, in the first place, that what we net on this operation is a loss. We have not been paid in American dollars for anything we gave up, and what we net on this operation is a loss, and it is somewhere between nothing and \$75,000. So

I make my appeal to the fairness of the committee and to the public policy in behalf of the United States Government living up to the agreements it has made. The committee may have in mind the fact that it is dealing now with a corporation which has not been paid in other coin for anything that it contributed toward winning the war.

That finishes the statement I came here to make, Mr. Chairman.

The CHAIRMAN. I presume that when you began to negotiate with the officers of the Government regarding your help in putting up nitrate plant No. 2, you were familiar with the law that was on the statute books and had been enacted on the 8d of June, 1916. There was a clause in that law which reads as follows:

"The plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital."

You were familiar with that, I imagine?

Mr. HAMMITT. I am quite sure that our attorneys were familiar with that provision and other provisions of law affecting this situation; and I am quite sure, Mr. Chairman, that if it were absolutely certain that that provision of law would always remain the same, it would have been useless to make any provision to cover a possible sale of the plant, but what the committee has before it now is a proposition to change that provision of the law and what the United States Government agreed to was that if that provision of the law ever was changed so that they ever did offer the plant for sale, we should have an opportunity, not on better terms, but on as good terms as anybody else, to acquire the plant.

The CHAIRMAN. You say the Government wants to change the law. Do you consider that if the Government desires to sell the plant outright to private individuals that that would be a change of the law?

Mr. HAMMITT. I would rather not testify, Mr. Chairman, regarding any question of legal interpretation; at least, without first taking the committee into my confidence to the extent of saying that I am not a lawyer.

The CHAIRMAN. You have stated your case very well.

Mr. HAMMITT. The committee would not care to take my judgment on any legal question, Mr. Chairman. If there is anything that the chairman or the members of the committee wish me to express an opinion on, having first stated that my opinion on a legal matter is of no value whatever, of course, I would be very glad to answer it.

The CHAIRMAN. The committee has been hearing this matter discussed from several viewpoints, and I think Gen. Williams stated to the committee he thought that despite that provision of the law, your company had a moral obligation; is that the way you feel about it?

Mr. HAMMITT. I feel there certainly exists a moral obligation, and I am advised and believe that there exists also a legal obligation. I came here to discuss the moral obligation, Mr. Chairman, because, quite obviously, the Judge Advocate General having passed upon the legal obligation, if the committee does not recognize any moral obligation, we may have to determine the legal obligation in the courts, and that is a thing that we want absolutely to avoid.

The CHAIRMAN. This is the evidence before the committee:

"The CHAIRMAN. We will ask the Judge Advocate General about that when he makes his statement. State why, in your opinion, there is a moral obligation?"

"Gen. WILLIAMS. The Government found itself very greatly in need of power. The Alabama Power Co. had already projected this extension, and all their plans had been drawn, and they came to the assistance of the Government at a critical time, putting at its disposal their facilities and the plans which they had already made.

"The CHAIRMAN. And those facilities and plans were accepted by the Government?"

"Gen. WILLIAMS. They were accepted by the Government.

"The CHAIRMAN. And have been used ever since by the Government, have they?"

"Gen. WILLIAMS. They were used for a while by the Government in the operation of the plant at Muscle Shoals"—

And so forth.

Mr. PARKER. That refers to the Alabama Power Co.

The CHAIRMAN. Yes; but they were both on the same plane with respect to this special work.

Now, what do you think would have happened if these companies had refused to help the Government during the war, because this all happened, as I recall, during the war.

Mr. HAMMITT. Mr. Chairman, I never gave that a minute's thought. Such a thing as the American Cyanamid Co. refusing to give its assistance during the war is a thing that nobody ever would conceive of, and what would happen as a legal matter I could certainly not advise. As a practical matter, it is an absolute impossibility to conceive of.

The CHAIRMAN. Well, of course, feeling ran very high in this country during that period when we were putting up this plant. There were people who thought that any man who would refuse to do what the Government asked was a traitor to his country.

Mr. HAMMITT. I think that feeling was justified.

The CHAIRMAN. Do you know what would have happened to the company if it had point-blank refused to take any action on the ground that the law itself set forth in this statement that the plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital?

Mr. HAMMITT. Well, Mr. Chairman, I really could not speculate as to what particular form it would take, but I should say that if any company had refused to cooperate with the Government, that its punishment should have been as complete as it was possible to make it. I think that perhaps the committee may find, upon investigation, that this particular nitrate plant is not subject to the provisions of that act of 1916. I believe it is a fact that if you will examine the accounting of the War Department, you will not find any part of the nitrate plant paid for out of the appropriation carried in that particular bill. I think you will find it paid for out of appropriations for armaments and fortifications, and it may possibly be, although I would not like to pass upon the question, that that provision does not apply to the nitrate plant itself. It does apply to other parts of the offer of Mr. Ford.

The CHAIRMAN. I think the evidence before the committee is that the money that was used for building this nitrate plant was not taken out of this fund, but the money for Dam No. 2 was taken out of this fund.

Mr. HAMMITT. Yes, sir.

The CHAIRMAN. But the fact remains that all the money that is in the Muscle Shoals plants was taken from appropriations that were made for military purposes.

Mr. HAMMITT. There is not the slightest doubt about that, Mr. Chairman.

The CHAIRMAN. I was going to read what Col. Hull had to say about the matter, and I will read what Col. Hull has to say about the matter of the moral obligation. I said to him:

"The CHAIRMAN. What do you think about that moral obligation?"

"Col. HULL. Ordinarily, I am strictly in favor of the Government carrying out its contracts that are duly entered into, notwithstanding that the officer, in the time of emergency, exceeded his powers."

That is the case here, probably.

But in this contract I notice it is a cost-plus contract. It is a long contract that bears many evidences of having been very carefully prepared by the attorneys for the company, and they have provided in there several very remarkable things, namely, the construction of a power-transmission line and power plant at the expense of the United States, but at the same time providing that the company takes the real estate and an option. The company can not get, ordinarily, in time of war, the right of way as cheaply or as expeditiously as the Government can, and it certainly would have been a matter of ordinary business sense when they were constructing a plant and buying real estate to do it in that way. Therefore, I believe it is a perfectly proper case to leave to Congress, after a due investigation, to determine what the equity of the matter may be.

Mr. HAMMITT. My comment on that, Mr. Chairman, is that the witness is discussing an entirely different contract, with an entirely different company, with which the American Cyanamid Co. and Air Nitrates Corporation have no connection whatever, and that whatever he may have said, whether it was well said or ill said, regarding the moral obligation in that particular transaction, has nothing whatever to do with the moral obligation in this transaction which I have been discussing.

The CHAIRMAN. The fact is that both companies, both the Air Nitrates Corporation and the Alabama Power Co. violated this positive section of the law, that, "the plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital." That is very clear to me as an expression of law.

Mr. HAMMITT. I do not think you mean to say, Mr. Chairman, though, that by taking a contract which made us the agent of the United States for the design and construction of the Muscle Shoals nitrate plant, which is all we have done, we violated the provisions of the national defense act. If that is the view, then our only escape from violating that provision would have been never to have built the plant, and the plant was needed for war purposes, and it is very fortunate that we were advised that we were not violating the law by building it.

The CHAIRMAN. That is why I asked you a moment ago what would have happened to your corporation if you had refused to come to the assistance of the Government while the Government was in a state of war.

Mr. HAMMITT. I think some means undoubtedly would have been found to have compelled us to do so.

Mr. MCKENZIE. Mr. Hammitt, how many years have you been connected with the American Cyanamid Co.?

Mr. HAMMITT. My connection with the American Cyanamid Co. developed through a connection with the Air Nitrates Corporation during the war, so that it is a matter of several years.

Mr. MCKENZIE. You are not familiar with the attempt at getting legislation in 1916 which finally resulted in section 124 of the national defense act. I take it?

Mr. HAMMITT. I have no familiarity from any personal contact with that.

Mr. MCKENZIE. Do you know of your own knowledge whether the American Cyanamid Co., represented by Mr. Washburn, appeared before the Committee on Military Affairs at that time advocating such legislation that would enable the Government to build the dams and afterwards lease the property to some corporation to operate?

Mr. HAMMITT. I would not like to testify in detail as to what Mr. Washburn had testified at that time, but I understand, while I have no personal knowledge of it, that he did appear.

Mr. MCKENZIE. You understand that that was the proposition which was submitted to Congress at that time, the American Cyanamid Co. having in mind the manufacture of nitrates at Muscle Shoals? But it was felt at that time, as some feel now, it was too big a proposition for any individual corporation to undertake, to pay the expense of construction of the dams, and therefore Congress was asked to make an appropriation to construct the dams and afterwards lease the power to some corporation.

Mr. HAMMITT. I would say this, in general, regarding any suggestions or recommendations that were made by any individuals prior to the war: While I am not a well-acquainted witness on that subject, and am very sorry that Mr. Washburn could not himself be before the committee, but he is prevented from being before the committee by illness, which has prevented him from attending to business for a period now of more than a year, and I will say, in general, that any recommendations regarding the disposition of that water power project made prior to the war and made prior to the enactment of the general Federal water power act, were based upon conditions both as to water power development and as to nitrate development, which are so radically different from the present conditions, that it would be very unwise to follow those earlier recommendations in dealing with the present situation.

Mr. MCKENZIE. At any rate, you are well aware of the fact that when such a proposition as I have stated was advocated at that time, did not materialize, we enacted section 124, as it now appears, of the national defense act, which provides for the construction by the Government and the operation by the Government of plants for the manufacture of this particular product which can be used in the manufacture of munitions, and is also useful in the manufacture of fertilizer.

Mr. HAMMITT. And I am quite sure that Mr. Washburn never, in any of his testimony, recommended that kind of a provision.

Mr. MCKENZIE. No; I understand that; but I say that is the situation now, that the law provides in section 124 that the Government shall operate this

*plant, as the chairman just read a few moments ago, not in conjunction with any other company.

Mr. HAMMITT. Yes; and, of course, unless you change that law you could not possibly accept the proposal of Mr. Ford.

Mr. McKENZIE. Yes. Now, coming down to the period of the war and this particular contract, a copy of which we have before us, can you tell the committee just how the American Cyanamid Co. came to enter into such a contract? Who took the initiative in that matter?

Mr. HAMMITT. The initiative, at the time the contract for the design and construction of the plants was entered into, was taken by the Government. Prior to that time, the American Cyanamid Co., having information that was the same information that led the Government ultimately to enter into this kind of contract, called the matter to the attention of the Government and recommended to the Government that they provide themselves with protection.

Mr. McKENZIE. Did representatives of the American Cyanamid Co. go to the Ordnance Department with certain recommendations or plans or suggestions, or did some one representing the Government come to the American Cyanamid Co., and if so, if you know, tell us how it was done, and the name of the representative or representatives of the Government.

Mr. HAMMITT. I can not give you any detailed testimony on that subject. I can state, in general, that the contract under which the Muscle Shoals Nitrate Plant was designed and built was written as a result of conferences to which the American Cyanamid Co. was invited by the Government, rather than conferences to which the American Cyanamid Co. had invited the Government.

Mr. McKENZIE. I was assuming from what you stated about the patriotic motives of the American Cyanamid Co., and their great desire to help the Government at that time, that they, perhaps, went to the Government and made certain suggestions, but I understand you now to say that the representatives of the Government came to the American Cyanamid Co., and, of course, the American Cyanamid Co. controls patents covering the manufacture of this particular form of nitrate; is that true?

Mr. HAMMITT. Yes; but the American Cyanamid Co. had at a previous time made representations to the Government recommending what it believed the proper course for the Government to pursue for the protection of the Government in its nitrates supply, and those suggestions having been made, and not having been, as I remember the situation, particularly well received at that time, the American Cyanamid Co. had no occasion for any further communications with the Government on the subject, and would have been justified in believing that the Government was more fully advised than the American Cyanamid Co. as to whether such provision should be made.

Subsequently, however, the Government invited the American Cyanamid Co. into conference, and it was as a result of that invitation that the negotiations were entered into that led to the writing of this kind of contract.

Mr. McKENZIE. You are aware of the fact, Mr. Hammitt, that during the war we had down here in Washington what was known as the Council of National Defense, and we had organizations and suborganizations there representing every possible phase of manufacture of the necessities of war. Now, can you not tell the committee just who it was that came to the American Cyanamid Co. and entered into these conferences with the American Cyanamid Co. to do this work?

Mr. HAMMITT. I am very sorry I can not; no, sir.

Mr. McKENZIE. You can not?

Mr. HAMMITT. I can not.

Mr. McKENZIE. Who can tell us?

Mr. HAMMITT. I would be very glad to prepare a complete history of that for the committee and place it in the record if that would serve your purpose.

Mr. McKENZIE. Yes; we just want to know how this was brought about.

Mr. HAMMITT. Yes, sir.

Mr. McKENZIE. So we can call on the representative of the Government. What I am driving at is to get the history of the matter.

Mr. HAMMITT. Yes.

Mr. McKENZIE. Now, at any rate, you held conferences, and your company, as I understand it, was imbued with the desire to do its patriotic duty to the Government in time of war, and you entered into conferences with representatives of the Government and started in to prepare a contract. When you did

Mr. McKENZIE. Not very much.

Mr. HAMMITT. I assume, at any rate, you will recognize the public policy back of the patent law, and you recognize that the United States patent law has a particular provision which provides that any person who has been granted a patent shall have the exclusive use of that patent for a certain number of years, for the purpose of encouraging invention, and you would certainly consider it unconscionable if, after investing money in the development of processes and the acquisition of patents and the finding of a market for a material on the strength of the existing laws, because of the interposition of a war the protection that those laws extend to everybody should be taken away from a particular company.

Mr. McKENZIE. I do not suggest any such thing. I think the owner of a patent is entitled to the protection of the law and royalty for the use of the patent by anyone else.

Mr. HAMMITT. But you do not require any other patentee to allow the use of his patent upon the payment of a royalty. You give him, under the provisions of the patent law—and if you do not believe that is a proper public policy, I think you should go about changing it—protection for a certain period of time. We invested our money on the faith of that protection. We ask that that protection be not taken away from us by reason of the interposition of a war emergency.

Mr. McKENZIE. If this contract is good under existing law, then in my judgment, the law itself needs amendment, because the way I view it, a contract of this character ought to be void on the ground of public policy.

Mr. HAMMITT. I am sorry you feel that way about it.

Mr. GREENE. Mr. Hammitt, you have called attention to article 19 of your contract, that is, the contract of the Air Nitrates Corporation and the United States of America, regarding the construction of the Muscle Shoals plant. You make out that you have, by the terms of article 19, the right to purchase the same upon as favorable terms as the United States is willing to accept from anybody else, and therefore, before the United States shall sell the same to any other party, you shall have the right to meet those terms, if you desire. Have you made any offer to the Government, based upon the provisions of article 19?

Mr. HAMMITT. We have not.

Mr. GREENE. In view of the fact that other offers have been made, do you wish to have yourselves now regarded as competitors for the plant on the terms of article 19?

Mr. HAMMITT. We do, on the terms of Article 19, to this extent. Of course, we did not make an offer of the character of the one that is under consideration before this committee, because, frankly, we would not have had the nerve to present that kind of a proposition to the United States Government, and we believe if we had come down here and presented that kind of a proposition to the United States Government, most of the comment would have been upon the extent of our nerve. But if the committee definitely decides that, contrary to what we frankly believe is public policy, the United States Government shall go into the business of subsidizing a particular manufacturing operation, then we want to bid for the subsidy.

Mr. GREENE. Is that answer to be interpreted to mean that if the United States Government will itself continue to hold the property and administer it, or let it stand out in a stand-by condition, you make no offer?

Mr. HAMMITT. At the present time we would not make any offer, because we do not believe it is practicable to have a commercial operation of that nitrate plant at the present time, unless the United States Government will make up the losses by providing a subsidy. And it never occurred to us that the Congress was going to embark the Government upon that kind of indirect competition with private business. But if the Congress does determine upon that policy then we must make our business arrangements under such policy as the Congress gives us, and we would want to have the subsidy, very likely, rather than have that subsidy given to somebody else to compete against us.

Mr. GREENE. But how can you get your proposal considered if you wait until Congress determines it shall be the policy to accept Mr. Ford's offer?

Mr. HAMMITT. If the Congress decides that, we think that the proper action to be taken is to remove the barriers existing in the law and enable a proper administrative officer to make a binding offer to the Air Nitrates Corporation, as provided in the contract, and give us an opportunity, as provided in the contract, to consider that offer.

then hoping you will be allowed to keep it long enough to get your money back and a profit.

Mr. MCKENZIE. Now, that brings me right back to my first point: Is it a fact that you employed Charles Evans Hughes as your attorney to prepare such a contract that you would absolutely be secured in the continuation of that monopoly?

Mr. HAMMITT. I would like to modify that only to this extent: Not to prepare a contract, but to advise regarding the form of protection that could be put in that contract, in order that we should have the very thing that is specified here, the right to buy that plant at Muscle Shoals on as good terms as you are willing to sell it to anybody else.

Mr. MCKENZIE. That absolutely prevents any competition, does it not?

Mr. HAMMITT. No; it does not prevent competition, provided Mr. Ford or somebody else is willing to purchase it on terms more favorable to the Government than we are willing to purchase it on. If we are willing to purchase it on as good terms as anybody else it gives us protection. If somebody else is willing to offer the Government better terms than we will accept, it gives us no protection.

Mr. MCKENZIE. Is it a fact that the American Cyanamid Co. has, for a number of years, had its eye on this particular plant at Muscle Shoals, and at no time was it taking any chances on anyone getting in there, either the Government or some lessee of the Government who might enter into competition with that company, and in the preparation of this contract, was not that one of the vital propositions you had under consideration?

Mr. HAMMITT. That question is also in two parts. In the first place, I do not know it to be a fact that the American Cyanamid Co. has had its eye looking in the direction of Muscle Shoals for a long period of time. It certainly is a fact, as the Congressman has suggested, when we got into negotiation with the Government looking to the design and construction of a plant four times the size of a similar unit in one of our own plants we considered it vitally important that there should be some protection against that plant being used in competition with us after the war. If there had not been a war there would not have been any plant at Muscle Shoals, certainly not built on those terms. Since there was a war, and by reason of the war need we provided that plant for the Government, we thought it very necessary that we should have protection against the use of that plant to destroy our investment after the war. In regard to the matter of protection I might say that the contract provided that we should be permitted to buy it on as good terms as anybody else.

Mr. MCKENZIE. You are a business man, I take it?

Mr. HAMMITT. Yes, sir.

Mr. MCKENZIE. You are somewhat familiar with the practices of business men in large corporations?

Mr. HAMMITT. Yes, sir.

Mr. MCKENZIE. Do you think it would be possible for any outsider, other than the American Cyanamid Co., under all the existing conditions, the American Cyanamid Co. controlling the patents and having an absolute monopoly of the situation, to come in and pay a price that the American Cyanamid Co. would be willing to pay in order to keep this proposition blocked?

Mr. HAMMITT. I will say that I do not think it is at all likely that anyone else can afford to pay the Government a better price than the American Cyanamid Co. can afford to pay the Government for the Muscle Shoals plant.

Mr. MCKENZIE. Then this is the situation: The millions of agriculturists of this country and those believing in the national defense feature of it are interested in the development of this particular proposition. You come to us very frankly—and I am not censuring you for it—you come very frankly putting your cards on the table, and ask this Congress not to take any action that would disregard a contract that was entered into by the American Cyanamid Co., and this Government when we were at war that would absolutely shut out the agriculturists of this country, or the Government, in the purchase of the materials to make explosives, and put them absolutely at the mercy of this company which has a monopoly; is that not the question?

Mr. HAMMITT. I should say it is not.

Mr. MCKENZIE. That is the way it looks to me; I may be wrong about it.

Mr. HAMMITT. Because, in the first instance, we have, under the provisions of this contract, no right to purchase that plant unless we pay for it as much as anybody else is prepared to pay. In the second place, I assume you have had some experience in business.

Mr. McKENZIE. Not very much.

Mr. HAMMITT. I assume, at any rate, you will recognize the public policy back of the patent law, and you recognize that the United States patent law has a particular provision which provides that any person who has been granted a patent shall have the exclusive use of that patent for a certain number of years, for the purpose of encouraging invention, and you would certainly consider it unconscionable if, after investing money in the development of processes and the acquisition of patents and the finding of a market for a material on the strength of the existing laws, because of the interposition of a war the protection that those laws extend to everybody should be taken away from a particular company.

Mr. McKENZIE. I do not suggest any such thing. I think the owner of a patent is entitled to the protection of the law and royalty for the use of the patent by anyone else.

Mr. HAMMITT. But you do not require any other patentee to allow the use of his patent upon the payment of a royalty. You give him, under the provisions of the patent law—and if you do not believe that is a proper public policy, I think you should go about changing it—protection for a certain period of time. We invested our money on the faith of that protection. We ask that that protection be not taken away from us by reason of the interposition of a war emergency.

Mr. McKENZIE. If this contract is good under existing law, then in my judgment, the law itself needs amendment, because the way I view it, a contract of this character ought to be void on the ground of public policy.

Mr. HAMMITT. I am sorry you feel that way about it.

Mr. GREENE. Mr. Hammitt, you have called attention to article 19 of your contract, that is, the contract of the Air Nitrates Corporation and the United States of America, regarding the construction of the Muscle Shoals plant. You make out that you have, by the terms of article 19, the right to purchase the same upon as favorable terms as the United States is willing to accept from anybody else, and therefore, before the United States shall sell the same to any other party, you shall have the right to meet those terms, if you desire. Have you made any offer to the Government, based upon the provisions of article 19?

Mr. HAMMITT. We have not.

Mr. GREENE. In view of the fact that other offers have been made, do you wish to have yourselves now regarded as competitors for the plant on the terms of article 19?

Mr. HAMMITT. We do, on the terms of Article 19, to this extent. Of course, we did not make an offer of the character of the one that is under consideration before this committee, because, frankly, we would not have had the nerve to present that kind of a proposition to the United States Government, and we believe if we had come down here and presented that kind of a proposition to the United States Government, most of the comment would have been upon the extent of our nerve. But if the committee definitely decides that, contrary to what we frankly believe is public policy, the United States Government shall go into the business of subsidizing a particular manufacturing operation, then we want to bid for the subsidy.

Mr. GREENE. Is that answer to be interpreted to mean that if the United States Government will itself continue to hold the property and administer it, or let it stand out in a stand-by condition, you make no offer?

Mr. HAMMITT. At the present time we would not make any offer, because we do not believe it is practicable to have a commercial operation of that nitrate plant at the present time, unless the United States Government will make up the losses by providing a subsidy. And it never occurred to us that the Congress was going to embark the Government upon that kind of indirect competition with private business. But if the Congress does determine upon that policy then we must make our business arrangements under such policy as the Congress gives us, and we would want to have the subsidy, very likely, rather than have that subsidy given to somebody else to compete against us.

Mr. GREENE. But how can you get your proposal considered if you wait until Congress determines it shall be the policy to accept Mr. Ford's offer?

Mr. HAMMITT. If the Congress decides that, we think that the proper action to be taken is to remove the barriers existing in the law and enable a proper administrative officer to make a binding offer to the Air Nitrates Corporation, as provided in the contract, and give us an opportunity, as provided in the contract, to consider that offer.

Mr. GREENE. I do not understand exactly what you mean by that. What do you mean by that?

Mr. HAMMITT. I mean that under the existing law, obviously Mr. Ford's offer could not be accepted.

Mr. GREENE. I do not know how you can say that. You are assuming more than the committee itself has made up its mind to propose.

Mr. HAMMITT. I understand it never would have come to Congress unless it was understood that it could not be accepted.

Mr. GREENE. You are reading into the record something that the committee has not passed upon. There is no testimony before the committee to that effect.

Mr. HAMMITT. I understand, at any rate, that the Secretary of War felt that he had no authority to make a contract with Mr. Ford.

Mr. GREENE. He has no right under the law to dispose of War Department property without the sanction of Congress. Even if it be an ordinary ammunition wagon, he can not sell it.

Mr. HAMMITT. But he has general authority to dispose of War Department property.

Mr. GREENE. Not including anything of this character.

Mr. HAMMITT. My judgment is that you would serve the best interests of the United States, if you desire to dispose of this property, by giving to an administrative officer general authority to dispose of this property on the best terms that can be obtained.

Mr. GREENE. Is that to be interpreted to mean that instead of accepting Mr. Ford's offer outright if Congress shall elect to provide that the property may be put into shape to be offered for competitive bids, you will then be a bidder?

Mr. HAMMITT. I would not be prepared to state, in behalf of the Air Nitrates Corporation or the American Cyanamid Co. that under any circumstances, if you separate the nitrate plant from the water-power project, that we would be prepared to offer a bid. But if the committee decides to deal, in the name of a nitrate proposition with what really is a water-power proposition, then I am quite certain in my own mind that the American Cyanamid Co. would like to be considered as a competitive element in the bidding.

Mr. GREENE. And until Congress elects one policy or another, you do not make any offer?

Mr. HAMMITT. No; we do not.

Mr. GREENE. And you stand, admittedly, as a dog in the manger?

Mr. HAMMITT. Not at all; because I will say this, Congressman, that while I can not speak, of course, on a matter that obviously must be submitted to the board of directors of the American Cyanamid Co., without it first being so submitted, that if the matter would be put in such a shape that I could submit to the board of directors of the American Cyanamid Co., and they to their stockholders, the acceptance or rejection of this property on the terms proposed by Mr. Ford, then my personal opinion is it would be accepted.

Mr. GREENE. Let us see how we get at that. When the United States Government did ask for bids on this property—that is, the War Department—did your company submit any bids?

Mr. HAMMITT. We were not asked to submit a bid on the nitrate plant in the first instance, but if we had been asked to submit such a bid, we would have been compelled to tell the War Department that there was no possibility of the operation of this nitrate plant at this time, or for a substantial period to come, on a commercial basis without loss, and we would not consider it proper to submit to the Government a proposal that the Government make up that loss. What we did receive was an inquiry as to whether we would be interested in proposals regarding the development of water power, and we advised the Chief of Engineers of the Army that our only connection with the Muscle Shoals property related to the nitrate plant, and that we could not see at present any way of making the nitrate plant a profitable customer for the water power, and that therefore it did not seem to us that we were able to help him any, but if he desired anything in particular from us in the way of cooperation, we would be glad to give it.

Mr. GREENE. You did not bid, but Mr. Ford did?

Mr. HAMMITT. Those two statements are certainly correct; yes, sir.

Mr. GREENE. Now, that Mr. Ford has bid, you interpose your right to prevent the execution of any contract with him, but you do not offer, on your own account, to take up, by a definite proposition from yourselves, property which you seek to prevent going to Mr. Ford?

Mr HAMMITT. Congressman, I do not believe, frankly, that the United States Congress is ever going to approve the principle of the Government dipping down into the Treasury to support a manufacturing operation. And I do not want, personally, to see the American Cyanamid Co. or the Air Nitrates Corporation put in the position of competing for that kind of subsidy, nor do I, as a matter of public policy, want to see the United States Government granting that kind of a subsidy to somebody else.

However, after all, when we get down to it, no matter how much you and I are discussing this from the point of view of the nitrate plant, this is not a nitrate-plant proposition; this is a water-power proposition, and this nitrate plant end of it is nothing except what somebody offers for the purpose of attracting a certain support in order to enable him to get a cheap water-power contract. We never conceived of the Muscle Shoals project in that light, and because we did not conceive of it in that light we, of course, were not in a position to write anything like this offer which Mr. Ford has proposed.

Mr. GREENE. I understand that very likely some phases of your suggestions might meet with a response from other persons in the room with regard to the matter of public policy. But that is not the issue involved. The issue is one plainly of the construction of contractual relations between the two parties and your alleged intervening right. What use do you intend to make of your right? The Government has asked you to make a proposition, but, as you explained, you have refrained from doing so because your idea of public policy would not permit you to make such an offer. In the meantime another man who has not the same idea of public policy but whose idea of public policy is quite different, has made an offer. Upon the receipt of his offer and notice to the public that he has made such an offer, you interpose your alleged intervening right. Now, the question is one concerning which the Government does not intend to let anything remain in suspense. It must dispose of one or both of these propositions. It must either accept or reject Mr. Ford's offer. Do you then insist that your regard for a proper public policy is so great that you will neither make an offer yourselves nor allow the Government to accept Mr. Ford's offer?

Mr. HAMMITT. I am firmly convinced that this whole problem can be solved much better, and you could get along with it very much faster if you removed the existing legislative barriers with which you obstruct the possibility of the disposition of this property, by placing an administrative officer in a position to negotiate. Then you may get some one, perhaps, who is willing to negotiate, but anybody who can not capitalize the advertising end of his proposition can not negotiate with the Congress of the United States. I could not negotiate directly with Congress as a Congress, so that I would talk across the table with you and you ask me to commit my company to something; you are only one of 435 men in one House. You could get along much faster and much better the other way. That is the fact, and that, as a man of some experience in business, you and other members of the committee recognize.

Mr. GREENE. You express your distrust of the court to which you submit your testimony.

Mr. HAMMITT. No; I simply suggest my view, very respectfully, to the effect that the function of this court is to perform within its legislative function, and my appeal to the committee is based upon a recognition of its legislative function.

Mr. GREENE. All right. Then, it seems, taking you at your own words, that you have not appeared with a definite, affirmative proposition; that instead of adopting Mr Ford's course and making an offer your suggestion is that Congress shall write some new legislation that will enable you to make an offer, and you have confined yourself in your statement simply to intervening your right. These suggestions that we change the law in order to enable you to come in appear to be second thoughts.

Mr. HAMMITT. I felt that the particular function that I had before the committee was to present this feature of the proposition as it bears upon the Ford offer, and I hope I will not be ruled out of court on the ground that I have not gone further than that.

But if you desire my suggestion, which I did not have the temerity to offer, as to what you ought to do about this Muscle Shoals situation, I will be perfectly glad to present it to you.

Mr. GREENE. That is exactly what we want.

Mr. HAMMITT. In the first place, I would separate the two propositions, which do not belong together. I would deal with the water-power proposition

as a water-power proposition, and I would deal with the nitrate proposition as a preparedness proposition.

Now, first, as to the water-power proposition, I would provide by general law for the development of the water power down there, by private capital under the provisions of the Federal water power act, the same as every other water power in the United States is developed, and I would remove the present restrictions in the law against the development of that water power under the general provisions of the water power act, without regard to the nitrate property.

Here is what I would do in regard to the nitrate property, or what I would advise the United States Government it should do. I would keep that nitrate plant unoperated, in a stand-by condition, which is 100 per cent better preparedness anyway than putting it in operation. If you want to know why that is so, I will be very glad to go into it, although I did not believe it was my function before this committee to do so. That is 100 per cent better preparedness. I would say keep it until such time as there is a possibility of its being operated commercially without a subsidy, and without bankrupting the operator, and when that time came I would lease it or sell it, or do whatever seems wise to do, and I would protect the Government's interest and mesh this into the general scheme of nitrate manufacture.

At the present time there is not any commercial operation of that plant that is possible without a subsidy, and that is what I would recommend to the Government, because there is no commercial operation of that plant now possible without a subsidy.

Mr. GREENE. Let me ask a question right here.

Mr. HAMMITT. Certainly.

Mr. GREENE. You laid stress upon the words "that plant." Is there not something in the local or physical condition that makes you have the view that it can not be operated without a subsidy?

Mr. HAMMITT. It is both in the local and physical condition, yes. The plant can not be operated commercially, Congressman, because it is not capable of making anything that has a market on which you could get back the cost of production.

Mr. GREENE. You are speaking of the nitrate plant?

Mr. HAMMITT. I am speaking of the nitrate plant; yes sir. It is not capable of being operated on a basis that would carry any overhead. It is simply not a practicable commercial proposition. I will say this to you also in order that you may fully appreciate our position. The very minute we feel that there is a possibility of operating the plant down there without losing money we will come to the United States Government with a proposition to operate that plant, if the way is still open.

Mr. GREENE. Your last remarks, I suppose, are directed to the physical condition of the plant, as the reason why it can not be operated without overhead.

Mr. HAMMITT. It is designed for the manufacture of a war explosive, ammonium nitrate. It can not be operated on ammonium nitrate, and nobody ever suggested it could be so operated at a profit. There is no market for ammonium nitrate that the full product of that plant would amount to, and there is no market for the ammonium nitrate that would be made there that would pay the cost of production.

Now, it can be, with certain additions and alterations, converted to the manufacture of various nitrogenous fertilizer materials. The only one of those that has a large enough market to make it an attractive operation for a plant anywhere near approaching that size is sulphate of ammonia, and the cost of producing sulphate of ammonia at Muscle Shoals would be from 30 to 50 per cent more than the present wholesale market price of sulphate of ammonia. That is the reason I say you can not operate that plant commercially at the present time.

Mr. GREENE. Then your proposition is if the Government should put it into such condition so that it may be operated commercially you will make a bid for it.

Mr. HAMMITT. If the Government retains it as a plant capable of producing ammonium nitrate, and that is the only field we have explored in our consideration of the matter, of course, because we have always considered and have been advised by the War Department that the preparedness feature of that situation was the paramount one, we do not know what they could change it to that would make it profitable in operation.

Mr. GREENE. Have you come forward with any helpful suggestions?

Mr. HAMMITT. I am sorry to say we have not been able to develop any suggestions that were really helpful. We have spent a good many hours discussing

the matter with representatives of the Department of Agriculture and the War Department, and we have made rooms full of figures trying to work out some proposition that would make the operation of that plant a feasible operation. We have gone at it seriously, and with a great deal of experience going back over a number of years. And I want you gentlemen to appreciate that I am not holding anything back at all when I say we know of no way by which that plant can be made commercially practicable.

Mr. GREENE. My questions are not to be construed as necessarily hostile. I want the facts.

Mr. HAMMITT. I have not so construed them.

Mr. GREENE. I want to know what your situation may be defined on the floor of the House to be, and so defined with your own authority back of it. It is apparent that so long as the Government will do nothing with this plant, will not let it get into the hands of any possible competitor of yours, you do not want the plant yourselves.

Mr. HAMMITT. Only with this modification, and that is that the present situation might change with market conditions, or if there were development in the art that would make it possible to have a successful commercial operation of a plant of that character. But under present conditions, and the conditions that we believe will obtain for a period of years, that is exactly the position of the cyanamid company.

Mr. GREENE. If somebody else makes a proposal that they will take the plant with such improvements and experiments as they may make and produce, how about that? Will you make any competitive offer in connection with that?

Mr. HAMMITT. We will not be interested in competing with them if they propose to do it at the expense of the United States Government. Under those circumstances we will not compete with them. We will not propose that the Government of the United States extend a subsidy, but as soon as it becomes apparent that the Government proposes to extend a subsidy to somebody else to compete with us, then we would want an opportunity to bid on it.

Mr. GREENE. I do not see after all but that the situation simply depends upon what Congress may do by and by, and therefore it is not merely a conjectural situation, but it is an impossible one. After Congress has done that it is too late for you to do anything.

Mr. HAMMITT. Would it be assisting this matter to have you instruct me to go back to New York and consult with the board of directors of the American Cyanamid Co. regarding what kind of a proposition, involving a heavy subsidy from the Government, they could offer to the Congress?

Mr. GREENE. The committee has no authority to offer any specific terms upon which a proposition may be based. You are aware of the fact that we are simply an advisory committee and not the final deciding power.

Mr. HAMMITT. Yes; and I think in disposing of this matter it is not a legislative but an administrative matter, and the legislative function is to provide certain general provisions of law under which the matter can be disposed of by an administrative authority.

Mr. GREENE. Then under those circumstances how would you figure it? In doing business with the Government you have to do things "as is," do you not? You do that in the commercial world?

Mr. HAMMITT. Yes; but we do not make much progress unless Congress makes the "as is" a condition under which progress can be made.

Mr. GREENE. You have, only a few sentences back, proposed how we might make that progress.

Mr. HAMMITT. No; I did not understand that I was making any proposition. I was asking you whether it would assist the committee to do a certain thing.

Mr. GREENE. But you defined what you would do with this property if you had control of it. That is the first time you put up an affirmative proposition. If you have that affirmative proposition in mind, why are you not empowered, in your own relationship to your company, to ask them to submit some proposition on the basis of that reason? Mr. Ford apparently went to work on the basis of his own reasoning, assisted by the advice of his experts, and submitted his proposition and asked Congress to come up to it. There is no existing law in reference to many of the details of Mr. Ford's proposition, and that is why he makes an affirmative proposition. Why do you not, having your own idea of what the public policy ought to be, and having your own

idea which you have expressed to the committee of the commercial status, make your own proposition and ask Congress to come up to it?

Mr. HAMMITT. You do not know the board of directors of the American Cyanamid Co. as well as I do if you think I can go into a meeting of that board of directors and suggest that we propose to the United States Government that the Government subsidize us to operate that nitrate plant.

Mr. GREENE. I did not make any such statement.

Mr. HAMMITT. That is the only basis on which we would operate the nitrate plant, or on which Mr. Ford can operate it, or anybody else, and make it a commercial success.

Mr. GREENE. You are here to oppose a subsidy to Henry Ford?

Mr. HAMMITT. Absolutely; Yes, sir.

(Thereupon the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met, pursuant to recess, at 2 o'clock p. m.

STATEMENT OF MR. J. O. HAMMITT—Resumed.

The CHAIRMAN. Mr. Hammitt, Mr. Hull would like to ask you some questions.

Mr. HULL. You spoke of a subsidy this morning.

Mr. HAMMITT. Yes, sir.

Mr. HULL. In what way do you think we are subsidizing Henry Ford?

Mr. HAMMITT. If the offer of Mr. Ford is accepted, Mr. Ford will receive very cheap water power at the expense of the United States Treasury because, in the first place, Mr. Ford proposes to pay a very much smaller interest rate to the United States upon the additional money the United States invests in the water power than he would be required to pay if, like all the rest of us in industry, he was compelled to finance the development of the water power in the usual way; and, secondly, Mr. Ford does not propose to pay any interest at all upon the amount of money the Government already has invested and a considerable part of the amount which the Government will have to additionally invest, and so I am sure, if you set the figures down, you will find that a considerable part of the cost of that water power will be paid, first, by the credit, and then by the actual expenditure by the United States of cash which will not be reimbursed to the Government. It was my impression that the committee had gone into that question thoroughly enough to have the exact financial facts relating to that offer before it, but if the committee has not such an analysis I should certainly be very glad to furnish one to the committee.

Mr. HULL. I do not know what the rest of the committee has, but I have gone into it far enough to say that in my opinion the use of the word "subsidy" is wrong. It is not a subsidy at all.

Mr. HAMMITT. Then suppose we say—

Mr. HULL (interposing). It may be a good bargain. I am not saying anything about that, but the use of the word "subsidy" is unfortunate, in my opinion.

Mr. HAMMITT. Then suppose we say, Congressman, instead of using the word "subsidy" which, of course, I use with a definition of my own in mind, that Mr. Ford would receive aid out of the Government Treasury in order to make up the losses which he would certainly incur from any operation of the nitrate plant he engaged in. Now, that is exactly what I meant by subsidy.

Mr. HULL. As I understand it, your company will not make an offer under any circumstances similar to Henry Ford's; is that true?

Mr. HAMMITT. No; my company will not come to the United States Congress and request the United States Congress to give it a subsidy; but I will say, Congressman, that if the Congress adopts a policy, which we understand is not the Government's policy, of dealing with matters of this sort by giving aid out of the Government Treasury and indicate that the best terms upon which it is prepared to give such aid are the terms involved in Mr. Ford's offer, and then, in carrying out this particular contract, puts that matter in such shape that I can take it to the board of directors of the American Cyanamid Co., it is my firm belief, of which I am just as certain as one can be of what will be the action of another group of men exercising their individual judgment, that we would accept it, and yet we would not ask it, Congressman, because, frankly, we do not believe it is in accordance with public policy that such a thing should be done.

Mr. HULL. As I understand it, Mr. Ford was asked to make an offer. Now, he has made an offer. As I understaid it, notice was sent to all companies to make an offer, and your company, which claims prior rights, has made no offer that gives it any prior rights.

Mr. HAMMITT. What rights my company has, Congressman, do not depend upon any offer made by my company. In the second place, neither Mr. Ford, as I understand it, nor the American Cyanamid Co., as I know the facts, was invited by the Chief of Engineers to make an offer for the nitrate plant at all, and we are not in the water-power business. We advised the Chief of Engineers that our interest in the Muscle Shoals situation could, naturally, in view of the business we are in, be only in relation to the nitrate plant, and as to that, we could see no way of making it a profitable customer for the water power, and that, therefore, we were not in a strong position to make any suggestion regarding the water power.

Mr. HULL. There is the peculiar part of your argument, as I see it. You claim that Mr. Ford is going to lose money, in one place.

Mr. HAMMITT. No; Congressman—

Mr. HULL (continuing). And then you claim in another place he is receiving a subsidy.

Mr. HAMMITT. And the two go together.

Mr. HULL. One moment. And you say you do not want to make an offer on the part where he would make money, but you would like to make an offer where he would lose money, perhaps; is that your proposition?

Mr. HAMMITT. Not at all.

Mr. HULL. It sounds like it to me.

Mr. HAMMITT. We see no way, without aid of the Government Treasury, that any company can afford to undertake at the present time the operation of that nitrate plant, and we will not ask aid out of the Government Treasury. Mr. Ford will not lose money on his proposition if it be accepted and sustained in the courts, in my opinion, because the losses will be borne by the United States Government through its contributions to the cost of the large and important blocks of power that Mr. Ford will receive, and it is entirely conceivable that by financing a valuable thing like a water power for an individual or a corporation you can make up to it enough of a premium to justify it in operating a manufacturing plant at a loss, and that really is the essence of the Ford proposal. It is not a fertilizer proposition, primarily, but it is a means of obtaining at the expense of the Government Treasury a very cheap water power.

Mr. HULL. But all the rights you have under article 19 are contained in this language:

"The agent shall be given the first opportunity (for a reasonable period of time not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made), to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

Mr. HAMMITT. Yes, sir; and we have not yet received that written notice. If it is desired—

Mr. HULL (interposing). But you know about it. You have that notice. You would not be here if you had not.

Mr. HAMMITT. Mr. Hull, if you will again direct your attention to the provision you have just read, you will observe it provides this procedure: First, the United States determines to dispose of the plant. That is the first thing that must be done. Now, the United States has not determined any such thing as yet. That is a matter that is under consideration here. That has not been determined and that is the first step. The second step is that the United States makes a written offer to the American Cyanamid Co. on what it considers the best terms it is prepared to accept, and then the American Cyanamid Co. having been given a reasonable time to consider that offer indicates whether it will purchase the plant on those terms or not. If it will not purchase the plant on those terms, then you are entirely free to deal with Mr. Ford or with anybody else unless you improve your terms. You must give us an opportunity to purchase this plant on as good terms as you are making with anybody, but if there is anybody who is prepared to purchase the plant on better terms than the American Cyanamid Co. will pay, then you can dispose of this option as soon as you place the matter in the hands of some administrative officer who can attend to an administrative job of that character, and it is not a matter of difficulty, and I do not believe it would take any six months.

Mr. HULL. I will say right here that I am somewhat of a stickler for keeping our obligations, but I certainly am not a stickler for keeping obligations with a company that does not try to protect its rights and hides behind hair-splitting technicalities such as you have mentioned here as a reason for not making an offer. You have known, the country has known, everybody has known, practically, that we are going to dispose of this property, in all probability. You have filed no offer. You make no pretense yet to making us an offer, and then you come in here and say that this committee can not dispose of this property; that you want it turned over to somebody else that you can do business with across the table. I might say that in my opinion there has been too much of that kind of business done across the table and not enough of it out here in the open where people can see what is being done.

Mr. HAMMITT. I hope, Mr. Hull, I have not made any suggestion that a reference of this matter to a member of the President's Cabinet would have the effect of initiating a kind of negotiation that could not stand the light of day, and, surely, Mr. Hull, you must recognize that a company like the American Cyanamid Co., whose total assets are not more than approximately one-tenth of the bank account of the Ford companies can not undertake to submit an offer in the existing state of the law with the same facility that Mr. Ford, with his control of more wealth than any other individual in the world, can undertake to submit. It is necessary, before we can make such an offer, that the matter be gone over with our bankers, with those who will be responsible for the financing of the proposition; and it is a matter of very much more difficulty, I assure you, to even excite the interest of a banker on a proposal that the contract never contemplated we should be required to make in order to protect our interests, made to the United States Government at a time when the United States Government requires a procedure through Congress and the enactment of laws in order that that proposition may be considered. Now, I think it is most unreasonable, especially after agreeing with the American Cyanamid Co. that it should have this opportunity of having the matter submitted to it and an opportunity to give it consideration—I think it is most unreasonable now to insist that the American Cyanamid Co. do a thing which only a man in Mr. Ford's peculiarly fortunate position would be in a position to do.

Mr. HULL. Yes; but you forget that we passed a law especially prohibiting this very thing of dealing with a private corporation.

Mr. HAMMITT. Yes; and Mr. Ford proposes now that you do so.

Mr. HULL. But it seems as though those who were to administer the law were persuaded, at least, by some one, to make a contract that defied the law, and then you come in here and get under that contract which was in express defiance of the law of Congress.

Mr. HAMMITT. Now, Congressman, I can clear that situation up, in the first place, and help, I think, the whole discussion of this question, by pointing out that the law to which you refer—the national defense act—does not apply to this contract at all, has nothing whatever to do with the work that was done under this contract. You have several different things down there at Muscle Shoals, and the one thing, the one important thing, that Mr. Ford is interested in and that the Chief of Engineers asked people to make offers for is the water power, and that water power, so far as it has been constructed, has been constructed under the provisions of the national defense act and with appropriations made by it. The nitrate plant was not built under the national defense act and did not come under the provisions of the national defense act. It is not held by the War Department that the national defense act has anything whatever to do with the nitrate plant or with this contract. So that the suggestion that this contract is a violation of the national defense act does not apply at all. The national defense act had nothing to do with it. This plant was built just like a cantonment was built, with no relationship whatever to the provisions of that section of the national defense act. I apprehend that that situation has not been fully understood. If you refer that same question to the Judge Advocate General, I am sure he will give you the same answer, as I have noted from reading the testimony that War Department officials have given you that same answer in this hearing.

Mr. HULL. The Ordnance Department, as I understand, gives us an answer somewhat like that.

Mr. HAMMITT. They undoubtedly were correctly informed.

Mr. HULL. But, as I understand it, the law was broad and covered the entire project. There was not any question when we passed the law but what it did cover everything they were to put in down there. It may be that in order to

place, it is very much too expensive a form of fixed nitrogen for fertilizer use; and, in the second place, it is hygroscopic; that is, it takes up moisture from the air and it cakes hard and it is unsuitable for handling by the farmer or for handling in a mixing plant, and there are certain other disadvantages about it, but the general fact is that ammonium nitrate is not a suitable fertilizer material.

As it stands to-day, the plant can not make any material that is used in the fertilizer industry. The cyanamid which would be made by that plant as a part of the process of manufacturing ammonium nitrate is a crude cyanamid that requires going through another process before it becomes a suitable fertilizer cyanamid. The only materials that that particular type of plant is of use in making that find a place in the fertilizer industry are these:

First, I will mention those that we consider serious; next, I will mention the one that Mr. Swann testified about the other day, which we never had considered serious, and do not consider serious yet, as a means of working out the Muscle Shoals situation, and I will be glad to state why we do not consider that serious.

The first is cyanamid. Now, you can make that cyanamid of the Muscle Shoals plant into a fertilizer cyanamid by a relatively minor process of further manufacture for which you must provide a plant that is not there now; but the total amount of cyanamid that we, who make all of it on this side of the Atlantic to supply the entire American market, and are now operating our plant at one-third capacity because there is not market enough even to keep our plant in operation, and we are unable to recommend to the fertilizer industry that they use cyanamid in fertilizer in greater percentages than 50 or 60 pounds, under ordinary conditions, to the ton of finished fertilizer, because if you use it in larger quantities under ordinary conditions of mixing you cause a reversion of your acid phosphate, a necessary part of that fertilizer, to an insoluble form of calcium phosphate that is not available for plant food. So that you have a definite limitation upon the amount of cyanamid you can use, and that limitation, if you shut our plant down and destroyed our own business entirely and gave the whole American market to Muscle Shoals, and then had the largest consumption of cyanamid that the American fertilizer industry has ever used in the largest year, you could make all of it with less than the capacity of 2 of the 10 furnaces at Muscle Shoals. So that is not an operation that could practicably be initiated at Muscle Shoals for the use of that nitrate plant and show anything except a heavy loss.

Now, you have another fertilizer material, another fixed nitrogen material, that the experts called in by the War Department considered very much more promising, namely, sulphate of ammonia.

In order to manufacture sulphate of ammonia at the Muscle Shoals plant, you use a certain part of the existing plant; not all of it. You never can use the entire plant in making any fertilizer material. In making sulphate of ammonia or cyanamid, you would use a part of that plant that represents in actual investment something like 50 or 60 per cent of the entire plant, and then to make your sulphate of ammonia, you would add another plant, which you would have to build down there, so you would carry your materials through that nitrate plant as it exists up to a certain point where you would have the ammonia gas, and that would be gotten through the plant that exists there now, and then you would carry it off in a different direction, through a new plant you would have to build, and at the end, you would get sulphate of ammonia. The cost of producing that sulphate of ammonia at Muscle Shoals we have estimated at approximately \$70 a ton. The committee has had before it the Chief of Ordnance of the Army and he has submitted an estimate which, as I remember, was \$75 a ton, and the committee has had before it the head of the fixed nitrogen research laboratory of the Department of Agriculture, and he has made an estimate, and his estimate, as I remember it, was \$65 a ton, and ours is midway between the two; but you can buy all the sulphate of ammonia you want, gentlemen, wholesale, at \$50 a ton, and the average price of sulphate of ammonia for the year 1921 was several dollars less than \$50 a ton. Now, if it costs you from 33½ per cent to 50 per cent more to make a material than you can buy it for at wholesale, and you are not going to raise the price of sulphate of ammonia by operating Muscle Shoals—you are likely to have the opposite effect upon the sulphate market by dumping all the product of that plant on the market—it is quite obvious you can not make that at a profit.

And then comes the suggestion presented here at some length, the other day by Mr. Swann for a third fertilizer material, phosphoric acid, and he said to build a hood over those carbide furnaces and provide certain additional apparatus, and we will smelt phosphate rock in that furnace with certain other materials, and we will get out of it a phosphoric acid. And, by the way, it does not help you a bit toward your war preparedness for nitrogen, because there is not any nitrogen in it, but, nevertheless, phosphoric acid is a very important fertilizer material, but the trouble with Mr. Swann's suggestion at Muscle Shoals is exactly the same as the trouble that Mr. Swann has found with his suggestion as he has been working it out at Anniston, Ala. To be sure, he can make a phosphoric acid by that method. He can make it at a price at which he has been able to sell it to the food industries that pay from 5 to 9 times the price per unit of P2O5 that the fertilizer industry can pay, provided he can bring out of that furnace as his main product, and the thing that absorbs the greater part of his phosphoric acid, not the phosphoric acid at all but a ferrophosphorus, and that is the thing, as he testified, he had been making his bread and butter on. Now, gentlemen, at Anniston, at the first of the year, according to the information we had from Mr. Swann, he had one 2,000-kilowatt furnace in operation. He had a 20,000-kilowatt plant and he had one-tenth of it in operation, and he was planning the operation of another furnace, and he was making ferrophosphorus as his principal product and he was getting a certain amount of phosphoric acid and in that way the operation was all right, up to that extent, and perhaps, he could put another 2,000-kilowatt furnace to work, but 4,000 kilowatts on that kind of operation will make all the ferrophosphorus that the American industry, even in normal times or the steel industry will use, and it is the steel industry it goes into, and as a by-product of the manufacture of that amount of ferrophosphorus, filling the full requirements of the normal American market, you would get the equivalent of 30,000 tons of 16 per cent acid phosphate, the fertilizer material.

Now, the normal consumption of acid phosphate in fertilizer is 4,000,000 tons. So that is the extent to which that kind of an operation can affect the fertilizer market. And so I might go on with not only fertilizer materials but every conceivable kind of material that you could make down there at Muscle Shoals, and, believe me, we have done this thing, because it is not a comfortable thing to us to have that plant, four times the size of our plant at Niagara Falls, in idleness and a continual threat. As soon as we can find a way we can suggest to the United States Government that that plant can be commercially operated, we will come down and beg the United States Government to take such steps as will make it possible to put it into operation. We want to get it disposed of in some way, so it is no longer a menace, but there is not a single thing we have been able to find that will make a commercial operation there.

Mr. MORIN. In your judgment, can Mr. Ford manufacture fertilizer or fertilizer compounds in that plant at a profit?

Mr. HAMMITT. No, sir.

Mr. MORIN. Suppose he should install a new process, other than the plant that is there now, could he do it?

Mr. HAMMITT. Not and use that plant.

Mr. MORIN. I mean if he installed a new plant.

Mr. HAMMITT. That is really too broad a field for me to give an offhand statement on. It is possible. I have no doubt that if Mr. Ford could get water power at the price that he would get it under this proposal, because of having assistance out of the National Treasury, he might be able to build plants down there that would make something or other at a very substantial profit, but he can not use that plant to make fertilizer materials at a profit, even under those conditions.

Mr. MORIN. It has been stated here that he could not unless he should install a new process, but that if he should install a new process, in order to allow him to make fertilizer or fertilizer compounds, the value of the plant there would be destroyed to the Government in case of war.

Mr. HAMMITT. He could not maintain that plant in a condition ready at any time to serve the purposes of the Government in war and use any other process that we know of for manufacturing his fertilizer material.

Mr. JAMES. In answer to a question from Mr. Morin, did I understand you to say that Congress has no right to authorize the Secretary of War to enter into this contract with Mr. Ford?

Mr. HAMMITT. I do not remember the particular question and answer, but the fact is, according to our advice, it would be necessary for the Government first to offer the proposition to the Air Nitrates Corporation on the same terms, and then, if we indicated we would accept it on those terms, it could not be offered to Mr. Ford. If we indicated we would not take it on those terms it could be offered to Mr. Ford on those terms.

Mr. JAMES. What you intended to say, then, was that you could not make any proposition to the Government until such time as the law was changed so that you could deal direct with some agent of the Government.

Mr. HAMMITT. And separating the nitrate plant from the water power, as it should be separated, of course, neither we nor anybody else would be in a position to make an offer to the United States on terms that the United States could afford to accept, to take over the nitrate plant and put it into operation.

Mr. JAMES. What are the total assets of the American Cyanamid Co.?

Mr. HAMMITT. Approximately \$15,000,000.

Mr. JAMES. What are the total liabilities?

Mr. HAMMITT. Well, assets and liabilities balance up, as you know, on a balance sheet. I have here the statement of the American Cyanamid Co., that I would be glad to hand to you, Congressman, if you would like to see it.

The CHAIRMAN. Would you object to putting it in the record?

Mr. HAMMITT. No, sir.

The CHAIRMAN. If it is rather short, could you not read it for the benefit of the committee?

Mr. HAMMITT. It is the usual annual statement of a company, and there is the usual preliminary matter consisting of an announcement to the stockholders, and then there are two tables of figures that give all the information that the committee could possibly want or could get from any ordinary financial statement, and I should think that if what you want is to know the condition of the American Cyanamid Co., you can get that best by putting in these two pages of figures. I would be very glad to read them, but that sort of thing does not permit—

The CHAIRMAN (interposing). Perhaps the members of the committee would like to hear it read. Mr. James, who is now questioning you, states he would like to hear that read to the committee.

Mr. HAMMITT. This is a statement for the year ended June 30, 1921. Do I understand you wish me to read it?

The CHAIRMAN. Yes.

Mr. HAMMITT. It shows current assets consisting of the following: Cash, \$380,339.85; notes receivable, \$1,600; accounts receivable, \$134,735.30; United States Liberty loan bonds at cost, that is, they are carried at cost, although the par is higher, \$50,376.15; inventories of merchandise, materials, and supplies, \$1,850,437.75, making a total of those current assets of \$2,417,489.05. Then there is due from subsidiary companies amounts totaling \$433,033.43. There are investments in subsidiary companies in amounts totaling \$4,846,714.20. The most important of those investments is in the Amalgamated Phosphate Co., engaged in phosphate mining in Florida, in the pebble phosphate district. That amounts to \$4,845,713.20, and the remainder is a nominal investment in a fumigating corporation and the \$1,000 of stock of the Air Nitrates Corporation. The fixed assets of the company amount in total to \$9,063,033.37, of which plant, properties, and equipment carried at cost, less reserves for depreciation, is \$4,241,830.67, and licenses, patents, and good will, less the proportion that has been written off upon them for depreciation, is \$4,821,202.70. With a small item of prepaid insurance added, that amounts to total assets of \$10,811,645.43. So that I was slightly underestimating when I stated, in answer to your question, in round numbers the assets of the company.

As against that, there are current liabilities of \$499,729.99. Those consist of the usual form of current liabilities, accounts payable, accrued wages and taxes, dividends payable, and reserve for income and excess-profits taxes. In addition to that, there are notes payable to subsidiary companies amounting to \$830,225, the largest part of which is, again, notes payable to the Amalgamated Phosphate Co., engaged in phosphate mining. The capital stock of the company constitutes liabilities of \$12,190,200. That consists of a little more than \$5,500,000 of preferred stock and a little more than \$6,500,000 of common stock. As I stated this morning, that preferred stock is a 6 per cent cumulative preferred stock, and it has paid all its dividends except the last two quarterly dividends. The common stock has never paid any dividends. The surplus

account is \$3,291,489.62. Now, that, as always in such statements, of course, shows an exact balance between the liabilities and the assets.

Mr. JAMES. The capital stock of the American Cyanamid Co. is about \$12,200,000, and of the Air Nitrates Corporation about \$1,000.

Mr. HAMMITT. Approximately \$12,200,000 for the American Cyanamid Co.

Mr. JAMES. If the United States believed that the Air Nitrates Co. had violated its contract, they would have to sue the Air Nitrates Co., would they not?

Mr. HAMMITT. If the remedy were by suit, that would be the company they would enforce that remedy against.

Mr. JAMES. They could not sue the American Cyanamid Co.?

Mr. HAMMITT. They could not; no, sir. As a matter of fact, Congressman, if it were a possible thing, which it is not, for a company with that limit upon its assets, responsibly to undertake work amounting to \$100,000,000 and make itself liable for that work, it certainly would require a degree of compensation to the financial interests that would have to carry that risk very much beyond anything that this thing cost, and there was not a single thing that Air Nitrates Corporation did in the expenditure of money, you understand, that did not require the approval of the officers of the United States Government, and Air Nitrates Corporation was the agent of the Government. It operated by direction of the Government as to every detail. We were giving knowledge and experience in design and construction, but when it came up to the question of buying equipment, the order for that equipment had to be approved by the United States.

Mr. JAMES. Yes; but you were not agent for the United States when you tied us up to this contract so we can not sell to anybody except yourself.

Mr. HAMMITT. The contract itself provides that we are the agent of the United States Government for the purpose of doing a certain thing that the corporation was created to do, and it was provided that that was the only thing that the corporation should be engaged in; but this particular provision of the contract is in there for the purpose of protecting the American Cyanamid Co., the real party in interest, against having used to destroy it after the war the thing that it provided for the Government during the war.

Mr. JAMES. Any judgment that the United States might secure would be against the Air Nitrates Corporation?

Mr. HAMMITT. Yes.

Mr. JAMES. No judgment would be against the American Cyanamid Co.?

Mr. HAMMITT. No.

Mr. JAMES. That means that the United States in case it got judgment would get judgment against a company with \$1,000 capital stock?

Mr. HAMMITT. Every one of whose acts had been directed by the officers of the United States Government itself, and irrespective of the capitalization of that company, if the company had made any money—

Mr. JAMES (Interposing). Just answer my question.

Mr. HAMMITT. Then, of course, the Government would have its remedy against whatever were the assets of that corporation, but the Government has never had any occasion to sue us because we performed our contract 100 per cent.

Mr. JAMES. If it got judgment, though, it could only levy against the assets of the Air Nitrates Co.

Mr. HAMMITT. I think that is quite clear.

Mr. JAMES. It could not levy against the assets of the American Cyanamid Co. with a capital stock of \$12,200,000, and assets of approximately \$16,000,000.

Mr. HAMMITT. I think that is quite true; yes, sir.

Mr. JAMES. I understood you to say you were not an attorney.

Mr. HAMMITT. No, sir.

Mr. JAMES. Then your opinion about the construction of any contract or law or anything else of that sort, being a layman, would be guided by the advice of Mr. Hughes and your attorneys, and not the Judge Advocate General's office.

Mr. HAMMITT. Not of Mr. Hughes at the present time, of course, because Mr. Hughes is not our attorney, but certainly I would be guided by the advice of the attorneys of the American Cyanamid Co.

Mr. JAMES. In fact, you would not be faithful to your trust if you did not take their word in preference to the Judge Advocate General's office.

Mr. HAMMITT. I think that is true.

Mr. JAMES. And being a layman like yourself, it is my duty to take the opinion of the Judge Advocate General's office on the construction of any contract against

the opinion of your attorneys. Now, I want to call your attention to a question asked by Congressman Greene of the Acting Judge Advocate General:

"If this proposition on the part of Mr. Ford is accepted as it is written in the copy before us, do you understand that thereby the United States Government is freed entirely from any resulting obligations to any corporation or firm or persons incidental to the Muscle Shoals project in any way after Mr. Ford has taken possession under the terms of the accepted proposition?"

"Col. HULL. So far as I have been advised, that is correct."

Any profits made by the Air Nitrates Co., are they still in the treasury of the Air Nitrates Co. or were they paid over to the American Cyanamid Co.?

Mr. HAMMITT. The situation was the other way, the American Cyanamid Co. has had to advance money to Air Nitrates Corporation, I believe, in order to meet the very small amount of obligations that the Air Nitrates Corporation has. The situation would be that if Air Nitrates Corporation made any profits they would certainly be turned over to the American Cyanamid Co.

Mr. JAMES. The Air Nitrates Co., I understand, has paid approximately \$1,200,000 in taxes.

Mr. HAMMITT. No, sir; they have not paid that much because they have not received their entire fee; but they have paid substantially the full amount of the tax bills so far as the thing has been assessed up to date.

Mr. JAMES. Who are the bankers of the American Cyanamid Co.?

Mr. HAMMITT. We have an account in the Guaranty Trust Co., the Bankers Trust Co., and one other in New York, which for some reason or other—

Mr. JAMES. I do not mean the particular banks where you do business, but you said that if you made a proposition you would have to consult your bankers, and I wondered what you meant by those words, "your bankers."

Mr. HAMMITT. Well, Congressman, I think we will have a very much better opportunity to do business with them if we do not notify them in advance that they are elected, and that is a question which I think on reflection you will excuse me from answering.

Mr. JAMES. Who are the leading stockholders of the American Cyanamid Co.?

Mr. HAMMITT. There are two stockholders who might be considered leading stockholders because they own a substantial part of the stock. One of them is Mr. James B. Duke and one is the Virginia-Carolina Chemical Co. Mr. Duke owns between 23 and 24 per cent of the stock and the Virginia-Carolina Chemical Co. owns approximately 26 per cent of the stock. To the best of my knowledge, and I think this is probably thoroughly accurate, there is no other individual or group or interest that possesses as much as 10 per cent of the stock, and probably none that possesses more than 5 per cent. In other words, they are the only two very large stockholders.

Mr. JAMES. About how much is Mr. Duke worth?

Mr. HAMMITT. I have not the slightest idea.

Mr. MILLER. Mr. Hammitt, the American Cyanamid Co. has been organized how long—how many years?

Mr. HAMMITT. About 15 years.

Mr. MILLER. Its capital stock, I understand you to say, is about \$12,220,000;

Mr. HAMMITT. Yes, sir.

Mr. MILLER. Were you connected with the American Cyanamid Co. prior to the organization of the Air Nitrate Co.?

Mr. HAMMITT. No, sir.

Mr. MILLER. Ten gentlemen, I believe, organized the Air Nitrates Co.

Mr. HAMMITT. No, sir.

Mr. MILLER. How many?

Mr. HAMMITT. It was organized by the American Cyanamid Co.

Mr. MILLER. Yes; and the American Cyanamid Co. paid the capital stock of \$1,000.

Mr. HAMMITT. Those 10 men you refer to, Congressman, had no interest through stock ownership or interest in profits or in any other way in the Air Nitrates Corporation, and were not entitled to receive a penny of compensation from Air Nitrates Corporation. They were simply 10 men who were loaned by the American Cyanamid Co. to the Government under the provisions of the series of contracts that provided for that.

Mr. MILLER. And these 10 gentlemen you speak of were executive officers, etc., in the Air Nitrates Co.?

Mr. HAMMITT. Yes; and in the American Cyanamid Co.

Mr. MILLER. So far as their association with the Air Nitrates Co. is concerned, the United States paid them entirely for their services, did they not?

Mr. HAMMITT. No, sir; they did not pay them a cent of any character whatever. What I mean is that the services of these men were given under the contracts. They received compensation but they received it all out of the private funds of the American Cyanamid Co. and not any of it from the Government.

Mr. MILLER. Then your schedule A on page 21 of the contract is of no force and effect.

Mr. HAMMITT. It is modified by the provision as to what Air Nitrates Corporation is to furnish without charge, and one of the things it is to furnish without charge is the services of these individuals.

Mr. MILLER. I call your attention to subdivision E of the schedule, on page 21, which reads as follows:

"Salaries of managers, engineers, superintendents, timekeepers, accountants, clerks, foremen, and other employees at the main and field offices of the agent in connection with said work, salaries of the executive officers of the agent except such as shall be placed at the disposal of the agent by the American Cyanamid Co. and set forth in said contract marked 'Exhibit 1.'"

How many of those gentlemen did the cyanamid company contribute?

Mr. HAMMITT. These 10 men to whom you referred, and they were not paid anything by Air Nitrate Corporation or by the Government, and the provision under which their services were delivered is covered by article 10 of the contract which you will find on page 11.

Mr. MILLER. Now, let us lay the cards right down on the table and see what we have here. We have the American Cyanamid Co. which you say was organized approximately 15 years ago. It has approximately \$12,200,000 of capital. Now, the war comes on and it is necessary for the United States Government to have a large output of ammonium nitrate. Your folks have been in the manufacture of that article for some years and you have a \$12,000,000 plant.

Mr. HAMMITT. Yes; of manufacturing nitrogenous materials.

Mr. MILLER. The United States Government negotiates with you and your cyanamid company immediately organizes a subsidiary company, known as the Air Nitrate Co., which is organized with a capital stock of \$1,000, and which is entirely paid for out of the assets of the American Cyanamid Co., and the executive officers, etc., in this Air Nitrate Co. were therefore connected with the American Cyanamid Co.; is that right?

Mr. HAMMITT. That is right as to these 10 men.

Mr. MILLER. Yes; and all other men, aside from these 10 men that were furnished by the American Cyanamid Co., were paid by the United States of America, according to subdivision E of schedule A.

Mr. HAMMITT. Yes, sir.

Mr. MILLER. Now, in that condition the Air Nitrates Co. enters into a contract with the United States Government as the agent of the United States Government. That is the situation, is it not?

Mr. HAMMITT. That is the situation, and you have stated it correctly up to the point—

Mr. MILLER (interposing). Then we have the anomalous situation of the United States Government, as a principal, entering into a contract with the Air Nitrates Corporation, as its agent; or, in other words, a principal entering into a contract with its agent. Now, I notice on page 4 of the contract with the Air Nitrates Co. this language:

"Whereas the said company is unwilling to subject its property and assets to liability in connection with the planning, construction, and operation of the proposed plants and has accordingly organized the Air Nitrates Corporation (the agent under this agreement) which shall act as the agent of and which shall be solely responsible to the United States and others in the planning, construction, and operation of the proposed plants, and according to the terms hereof."

Now, the Air Nitrates Co., which you say is owned by the American Cyanamid Co., got a construction fee on this work, did it not?

Mr. HAMMITT. A fee for design and construction.

Mr. MILLER. Yes; for designing and construction. That is shown on page 12 of the contract. You got a fee for construction of $3\frac{1}{2}$ per cent of the cost up to \$30,000,000, and then you get a fee of $1\frac{1}{2}$ per cent of all sums above \$30,000,000 that was put into this proposition. There was approximately \$67,000,000 put into the plant, was there not?

Mr. HAMMITT. Approximately.

Mr. MILLER. Then, according to a rough arithmetical computation, your construction fee would amount to about \$1,804,200.

Mr. HAMMITT. If there were not a provision fixing a maximum beyond which we should not be compensated.

Mr. MILLER. Where is that provision? It says here $1\frac{1}{2}$ per cent of such cost in excess of said \$30,000,000. "The total of the construction fee shall not exceed \$1,500,000." That is what you mean?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. Now, this \$1,000 corporation, in the interest of your \$12,000,000 corporation, gets a construction fee of \$1,500,000 for the construction of that plant. Then on top of that you get an operation fee, do you not?

Mr. HAMMITT. Yes; which amounted to—

Mr. MILLER. You get an operation fee of $2\frac{1}{2}$ mills per pound.

Mr. HAMMITT. Yes; and I want to say that in my statement that the company has sustained a loss rather than a profit, I included the operation fee, which amounts to about \$7,000, and also the royalty, amounting to about \$8,000, making a total of about \$15,000. That all goes into the pot and yet we came out with less money than we started with.

Mr. MILLER. Let us see what you get and where we are coming out when this contract is fulfilled. We have got \$1,500,000 as a construction fee, and we will put that down, and then let us see about your operation fee:

"One-fourth of 1 per cent per pound of ammonium nitrate produced in compliance with article 7 hereof, and accepted or utilized by the United States, up to and including 110,000 tons produced in any fiscal year of the United States, and one-eighth of 1 cent per pound of ammonium nitrate so produced and accepted, or utilized in any said fiscal year in excess of such 110,000 tons. Payment shall be made monthly."

Now, you have computed, if this plant runs at full capacity, what your operation fee will be, have you not?

Mr. HAMMITT. You mean if we had operated it?

Mr. MILLER. Yes; that is what they built this plant for—to operate.

Mr. HAMMITT. I have not that computation in front of me.

Mr. MILLER. 110,000 tons of ammonium nitrate figuring on a basis of 2,000 pounds to the ton makes about 220,000,000 pounds of ammonium nitrate per annum which would be the capacity of that plant. That runs into money pretty fast.

Mr. HAMMITT. Is that a question? I am not sure I got it.

Mr. MILLER. That is the construction fund and the operation fund. Now you have another thing, and that is this royalty. Your royalties are covered by a contract between the United States and the American Cyanam'd Co.?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. Which contract was entered into simultaneously with the contract between the United States and the Air Nitrates Corporation?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. In other words, we have the agent of the Government in the construction of this plant, the child of the parent corporation, and your parent corporation, also, all of you entering into a contract with the United States Government.

Mr. HAMMITT. That is quite correct.

Mr. MILLER. I am referring now to page 27 of the contract, in regard to royalties, Article VI, which says:

"In consideration of the granting of the license provided for in Article I hereof and of the other conditions to be performed by the licensor, the licensee agrees to pay the licensor during the term thereof specified in said article, as royalty, an amount equivalent to 6 mills per pound on all nitrogen fixed as lime nitrogen manufactured at the plants hereinbefore described in the contract of even date between the United States and the Air Nitrates Corporation, and to which reference has hereinbefore been made, up to and including the first 91,700,000 pounds of such nitrogen so fixed in any fiscal year of the United States, and in addition thereto 3 mills per pound on all nitrogen fixed as lime nitrogen, in any said fiscal year in excess of the said 91,700,000 pounds of nitrogen."

The output of plant No. 2 being 110,000 tons of ammonium nitrate, figuring 2,000 pounds to a ton, the amount would be about 220,000,000 pounds a year. would it not?

Mr. HAMMITT. Your figures are all right, except for this fact: You are not dealing, in fixing these fees for royalties, for example, upon the tonnage of ammonium nitrate. You are dealing with the tonnage of nitrogen.

Mr. MILLER. What is the difference between the tonnage of nitrogen and ammonium nitrate at a factory at which you are only producing ammonium nitrate?

Mr. HAMMITT. Because the amount of nitrogen in the 110,000 tons of ammonium nitrate, would only be about 42,000 tons. With that exception you are dealing with a correct computation of what would have been our profit if we had operated the plant under this contract.

Mr. MILLER. Forty-two thousand tons of nitrate is all that this plant can produce?

Mr. HAMMITT. Of nitrogen.

Mr. MILLER. You mean of nitrogen?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. Why did you compute the royalties on nitrogen instead of royalties upon ammonium nitrate?

Mr. HAMMITT. Because the nitrogen is the valuable thing which has been produced, and the rest of it is merely the carrier of that nitrogen. For the same reason, for example, that we sell our product in commerce to the fertilizer industry on the same basis except that we use a unit of ammonia instead of a unit of nitrogen.

Mr. MILLER. How much royalty did you figure the American Cyanamid Co. would get out of this plant when it was running at its full capacity; that is, how much royalty would you get out of the United States Government?

Mr. HAMMITT. That is so far from anything that ever was an actual fact that I can only make a rough, quick estimate. I should say it would be about a million dollars.

Mr. MILLER. About a million dollars a year?

Mr. HAMMITT. About a million dollars a year, at the capacity of that plant.

Mr. MILLER. Then if the United States Government is running this plant at its full capacity you would be getting 10 per cent on your capital stock out of this one institution, would you not?

Mr. HAMMITT. It does not come to quite 10 per cent; it would be approximately 8½ per cent.

Mr. MILLER. A million dollars a year on a capital stock of \$12,220,000?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. It would be between 8 and 9 per cent.

Mr. HAMMITT. Yes, sir.

Mr. MILLER. On top of that, your American Cyanamid Co. is the beneficiary of this construction fund and the beneficiary of the operating fund?

Mr. HAMMITT. You mean the construction fee and the operating fee?

Mr. MILLER. Yes.

Mr. HAMMITT. Yes; and, of course, the United States, if we had made that kind of war profits, would apply the same system of taxation.

Mr. MILLER. I am not talking about taxation; I am not saying a thing about taxation. I am talking about the relation between the United States Government and the American Cyanamid Co.

Mr. HAMMITT. The only reason I mentioned it—

Mr. MILLER (interposing.) You are getting a million dollars out of the royalties?

Mr. HAMMITT. Not "are getting," but would have gotten in case the plant were operated to its capacity for a year.

Mr. MILLER. I am basing this on the hypothesis that the plant will be operated to its full capacity of 110,000 tons of ammonium nitrate a year. Your royalties will amount to a million dollars a year, you say?

Mr. HAMMITT. Yes; that is the right figure; I guess it is somewhere near right.

Mr. MILLER. Then the operating fund or the construction fund will amount to how much all told?

Mr. HAMMITT. The construction fee would amount to a million and a half. Mr. MILLER. Adding that to the other makes two millions and a half. Now, you are entitled to your operating fee, which according to the basis figured on here, with the plant running at capacity, would be in the vicinity of \$500,000 a year?

Mr. HAMMITT. I am assuming your figures are right, Congressman.

Mr. MILLER. I think they are. Now, the American Cyanamid Co. has gotten between 8 and 9 per cent on its capital stock out of your royalties every year, provided the plant runs to capacity?

Mr. HAMMITT. You mean we would have gotten, if that hypothesis were correct.

Mr. MILLER. I did not mean out of the royalties, but out of the construction fee, which is \$1,500,000.

Mr. HAMMITT. We have not yet received it, but we believe we ultimately will receive it.

Mr. MILLER. I am figuring out where the Government gets off under the terms of this contract. The Government was to pay \$1,500,000 as a construction fee. That is what we obligated ourselves to pay; that is the maximum sum?

Mr. HAMMITT. That is the maximum construction fee under the contract.

Mr. MILLER. Now, we pay you, if the plant runs to its capacity, \$1,000,000 in royalties annually as long as the plant runs. We are to pay you an operating fee as long as the plant runs at the rate of \$560,000 a year. Now, if these contract provisions are carried out we will pay you \$1,500,000 for the construction fee, which is approximately 9 per cent on your capital stock; then we pay you between 8 and 9 per cent on your stock for royalties every year, so in about 10 years that would absorb your entire capital stock. And we pay you \$560,000 more per year to operate this plant. It looks like a pretty good contract from the American Cyanamid Co.'s angle of it, does it not?

Mr. HAMMITT. But you are considering and describing a situation which is a hypothesis that, of course, never happened.

Mr. MILLER. You figured, did you not, that this plant would run to its capacity, Mr. Hammitt? Did not the American Cyanamid Co. figure it would run to its capacity?

Mr. HAMMITT. I assume—

Mr. MILLER (interposing). And provided for it in its contract?

Mr. HAMMITT. But assuming the American Cyanamid Co. figured that the operation would be built up to capacity, and would be continued to capacity until the war was ended. Of course, the fact is that the war ended, substantially, with the armistice in November, 1918, and what you are describing is not what the American Cyanamid Co. has received or will receive under this contract. But once you put that in the record, Congressman, if it is made perfectly clear that that would have been true if we had received these things, and that they are based upon a hypothesis of circumstances that did not actually happen, then I am perfectly willing you should make your own analysis and put that in the record.

Mr. MILLER. I thoroughly realize, Mr. Hammitt, that the plant did not come up to full capacity.

Mr. HAMMITT. I know that.

Mr. MILLER. I am undertaking to analyze what the Air Nitrates Corporation was prepared to do with the United States Government and what the American Cyanamid Co. was prepared to do with the United States Government under the terms of the contracts with the United States Government, entered into with each of the corporations, which based the proposition upon the capacity of the plant.

Mr. HAMMITT. Yes.

Mr. MILLER. And the calculations I made are that you will get, or the American Cyanamid Co. will get, annually as long as that plant runs to capacity, between 8 and 9 per cent on the entire capital stock of the American Cyanamid Co.; am I right about that?

Mr. HAMMITT. I certainly believe that those figures you have used are either exactly accurate or somewhere near accurate; I do not want to quarrel with you about those figures.

Mr. MILLER. Take it as between 8 and 9 per cent a year, if the plant runs to capacity. In 11 years, or a little over 11 years, that amount will have paid in the entire capital stock of the American Cyanamid Co. in royalties, would it not?

Mr. HAMMITT. It would not run for that period of time because it is not conceivable it can run for that period of time on that basis, because the most important of the patents would expire. But except for that statement, your statement is quite correct, assuming that what you are talking about all the time is gross return, and you are not deducting from that gross return, as the taxpayer of course has to deduct from his gross return before he can amortize any of his capitalization, and deduct that in the payment of taxes.

Mr. MILLER. I do not want any reference again, Mr. Hammitt, to taxes. We all have taxes to pay. You quibble when you have to pay back to the Government of the United States the character of taxes you have to pay, and

that is altogether a different thing. The word taxes is not mentioned in the contract. You can not find it in the contract. What I am trying to get at is this, in connection with this organization: In the relations between the United States Government and the Air Nitrates Corporation on the one hand and the United States Government and the American Cyanamid Co. on the other hand, I want to find out whether or not, if the contract was carried out, in 11 years, from the income of the royalties alone, the United States Government would have paid back the entire capital stock of the American Cyanamid Co. at the rate of \$1,000,000 a year, which you figured out to be the amount. What taxes you have to pay is another matter. On top of that you get \$560,000 a year for an operating fee, which is over half the amount you get on royalties, and you figure royalties at approximately 9 per cent, so that your operating fee is at least $4\frac{1}{2}$ per cent.

So there is another fund that would pay up the entire capital stock of the American Cyanamid Co. in less than eight years, if the plant is running at full capacity; that is, those two funds flowing in to the American Cyanamid Co. would entirely absorb the capital stock of that company in less than eight years.

Mr. HAMMITT. Provided it stayed in the American Cyanamid Co. they would.

Mr. MILLER. I mean under this contract you have entered into with the United States Government.

Mr. HAMMITT. Assuming that the contract operated in that way, and that we were to assume or could assume the same attitude of lack of interest in taxes that you assume when you refuse to permit them to be mentioned. When we come before certain committees of Congress we are told that taxes are a very important thing. Then when we come before another committee of Congress, I know you do not intend to have the record show that because these taxes are not mentioned in the contract they do not have to be paid, but if you pay 80 per cent back in taxes to the United States Government and 5 per cent back in taxes to the State of New York, then you have a very different net result than if you leave those things out. And the only objection I have to leaving those things in is not to interfere with a perfectly sound mathematical calculation, but to interfere with any impression that may be had from your remarks that money that is taken away from us stays with us, because it does not, and this money, of course, we never received.

Mr. MILLER. I will ask you again that you cease reference to the tax proposition. I am not getting at that at all at this time.

Mr. HAMMITT. I think that is a very unfair request, but I will comply with it.

Mr. MILLER. What I am getting at is the relation between the United States Government and these two corporations. Now, we have from your income from the operating fee a fund which the American Cyanamid Co. gets the benefit of, and an income from the royalties, of which the American Cyanamid Co. gets the benefit, and which would pay up the entire capital stock, less your taxes, in a little over eight years.

Mr. HAMMITT. That would seem to be—

Mr. MILLER (interposing). On top of that we have, the first crack out of the box, \$1,500,000 for a construction fee which the American Cyanamid Co. gets the benefit of. Then, according to my hasty calculation, the United States Government, in this contract, obligates itself to pay the American Cyanamid Co. a construction fee, an operating fee, and royalties which all come out of the United States Treasury and go to the American Cyanamid Co., and would pay every dollar of the capital stock of that company in a little over five years—that is, the whole capital stock amounting to \$12,220,000.

Mr. HAMMITT. As long as you could apply it to that purpose, it would.

Mr. MILLER. Out of that you have taxes and overhead to pay?

Mr. HAMMITT. Yes; you bet we have.

Mr. MILLER. But the United States entered into that contract upon the basis of which you were to receive in a little over five years an amount equal to the entire capital stock of the American Cyanamid Co. paid back to you out of the United States Treasury; that is approximately right, is it not?

Mr. HAMMITT. Assuming that the war should continue for that period of time, and assuming that the operations should continue for that period of time, and subject to an opportunity which I should like to have to correct these figures on the record, if, upon a computation, I find that they are not correct.

Mr. MILLER. It is not necessary for the war to continue. The only thing necessary to continue is the plant, at its capacity production, and then you would get the benefit of all these things.

Mr. HAMMITT. Provided the operation to capacity production were operated by the Air Nitrates Corporation; otherwise we would not get the benefit of these things.

Mr. MILLER. What I was getting at was where the United States Government gets off out of these contracts and where the corporation dealing with the United States Government comes out at the end of the road. We have a nitrate plant down there which the Air Nitrates Corporation constructed and which cost the Government in the neighborhood of \$87,000,000. As a part of that enterprise, it was conceived by the United States Government that it would operate these by hydroelectric power.

Mr. HAMMITT. I do not get the last part of that.

Mr. MILLER. I say from the Government's proposition and the Government's end, the intention of the Government is to operate that nitrate plant No. 2 by hydroelectric power generated by the water-power plant.

Mr. HAMMITT. If that is the intention of the United States Government—

Mr. MILLER (interposing). There could be no other intention in the world, could there, Mr. Hammitt, when the United States Government is building a \$87,000,000 plant on the banks of the river and then starting in to build a dam, putting \$17,000,000 into the dam; there could be no other hypothesis than that it was the intention of the Government to run that plant by the hydroelectric power generated at that dam, could there?

Mr. HAMMITT. I am frank to say I can not give you the precise hypothesis on the basis of which that money was put into the dam, because the dam was not built to operate that plant at the time; nor was the water power essential that it should be operated during the war. The construction of that dam, while it was undertaken, was very quickly stopped during the war because it was obvious that it would take so long to complete the water-power project that you would not have the use of it during the war. So it seems the plant was not built for that purpose.

If you conceive of a commercial operation of the nitrate plant by the United States Government, then I can see that you must conceive of the delivery of very cheap hydroelectric power to that plant for that purpose. If you conceive of a plant being held in stand-by condition for use in war, I should recommend that you separate the hydroelectric-power project from it entirely and deal with it as an entirely separate matter.

Mr. MILLER. Your only reason in separating the water power from the nitrate plant is that cheap power there would enable the product of that plant to come in competition with your product at a less expense of production, is it not?

Mr. HAMMITT. No, sir; it is not.

Mr. MILLER. Let us hear why it is not.

Mr. HAMMITT. I want to make that perfectly clear. Our interest is not affected by any belief, for we have no belief, that even with power at the price Mr. Ford could get it under this contract he could operate the nitrate plant otherwise than at a loss. We have arrived at that belief as the result of very careful study of the subject, and we say that even with power at the price at which Mr. Ford would get it he could not operate the nitrate plant except at a loss. But Mr. Ford would receive under this contract vastly more power than could possibly be used in the operation of the nitrate plant, and he would receive that so cheap that he could afford to take a loss on such operation of the nitrate plant as he entered into under this contract and to pay that as a premium for the water power he got—and it is the water power he is primarily interested in, of course.

Mr. MILLER. You and I are perfectly in accord upon that proposition—that the water power is the inducing cause of Mr. Ford's making any proposition to the United States Government in connection with this project. But the only thing you are afraid of is that Mr. Ford would get the benefit of cheap power there and run his nitrate plant with that cheap power; and if he should run it at a loss, the loss could be recouped out of the profits from the surplus water power.

Mr. HAMMITT. Exactly so; yes, sir.

Mr. MILLER. Now we understand each other on that proposition. This plant makes ammonium nitrate. Does your factory at Niagara Falls make ammonium nitrate?

Mr. HAMMITT. No, sir.

Mr. MILLER. This plant makes ammonium nitrate. What does your plant make?

Mr. HAMMITT. We make at Niagara Falls for our main product, cyanamid; and if the Muscle Shoals plant were entirely devoted to the manufacture of ammonium nitrate, we would not have the slightest concern about any competition from that plant, because that is not the product we make or propose to make. On the other hand, after you got your ammonium nitrate you would have to dump it into the Tennessee River and float it to the Gulf of Mexico, because you would not have any use for it.

Mr. MILLER. I was very much pleased, Mr. Hammitt, with your patriotic angle of this thing, which you stated to the committee this morning, turning over your entire organization. But I see out of that patriotic impulse you had that there was a scheme of financing, or a principle of philosophy in financing it, by which, if the output of this Government factory should continue uninterrupted, it would pay up the entire amount of the capital stock of the American Cyanamid Co. in a little over five years.

Now, also, on top of that we have what I should call a very remarkable proposition here in connection with Article XIX in the contract between the United States Government and the Air Nitrates Corporation. This article is a very cleverly drawn article; and you say it was drawn by no less an attorney than Mr. Charles E. Hughes?

Mr. HAMMITT. No, sir.

Mr. MILLER. Who drew it?

Mr. HAMMITT. I really can not tell you who drew it.

Mr. MILLER. Mr. Hughes was called in consultation on it, and it received his O. K.?

Mr. HAMMITT. As to whether this particular language received the approval of Justice Hughes, I can not state. I can state that this form of protection was provided on the strength of his advice.

Mr. MILLER. Article XIX reads as follows:

"Sale of plants.—If upon cessation of this war or for any other reason the United States determines to cease the construction, equipment, or operation of any of the said plants and to dispose of the same, the agent shall be given the first opportunity (for a reasonable period of time, not to exceed six months after receipt of written notice stating the determination of the United States to dispose of the same, and the material terms upon which such disposition will be made), to purchase the same upon as favorable terms as the United States is willing to accept therefor, before the United States shall sell the same to any other party."

Then that article 19 of the contract between the United States Government and the Air Nitrates Corporation was clearly made in the interest of the American Cyanamid Co.

Mr. HAMMITT. Undoubtedly; yes, sir.

Mr. MILLER. Then we have this anomalous condition, with the subsidiary corporation of the American Cyanamid Co., itself likewise at the same time an agent of the United States Government, negotiating a contract with its principal in the interest of the parent organization. That is what you have there, is it not?

Mr. HAMMITT. As a matter of fact—

Mr. MILLER (interposing). That is just exactly what the situation is, is it not?

Mr. HAMMITT. Yes; from the technical point of view, but the practical situation undoubtedly was that men who knew exactly what interests everybody represented, and who had a definite object to accomplish, and who were all of them agreed that this protection should be extended to the American Cyanamid Co., sat around the table and agreed upon the form of protection. Now, there was not any case of doubt as to the fact that every man in that conference who was an officer of the American Cyanamid Co. was there for the purpose, among other things, of protecting the interests of the American Cyanamid Co., and it was fully agreed by the representatives of the Government that there was an interest there which should be protected.

Mr. MILLER. And I think they were perfectly successful in protecting that interest.

Mr. HAMMITT. I think so; yes, sir.

Mr. MILLER. What you were getting rid of under the provisions of article 19 was a possible competitor after the war was over, was it not?

Mr. HAMMITT. Unless that competitor were prepared to pay a higher price for the plant than we were willing to pay.

Mr. MILLER. You had a right under your contract to buy this plant from the United States Government should it ever desire to sell it at a price equal to that of any other offer?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. And your purpose in putting that in there was to head off a possible competitor?

Mr. HAMMITT. Yes, sir.

Mr. MILLER. Then we will add to the other things, where the contract provided for a system of financing this proposition by which the American Cyanamid Co. would get its capital stock entirely paid for within five years or six years, this incidental proposition by which you would get rid of a competitor, or you would have a preferential right over any other competitor when the war was over.

Mr. HAMMITT. If there had not been any war and we had continued to hold and operate under our patents and processes, there never would have been any other competitor, and if there had not been a war and the plant had not been designed and constructed there never would have been a competitor. So we were not getting rid of a competitor, which, had there not been the interposition of a war, we never would have been compelled to face. That is the point.

Mr. MILLER. But, on the other hand, if there had not been a war there would have been no necessity for the United States Government entering into a contract with anybody. But you say this contract was predicated upon the war, or the necessity for making this contract was predicated upon the war. Let me take another angle of this proposition. You want the water power and the possible fertilizer angle divided?

Mr. HAMMITT. I think that is the best solution that can be offered for this problem.

Mr. MILLER. How would you be in any better situation, so far as Mr. Ford's offer is concerned, if the water-power proposition were considered alone and the cyanamid proposition were considered alone? If Mr. Ford's proposition should be accepted, including both of those angles of it, by the United States Government, he would then be the owner of both and he could sell himself power.

Mr. HAMMITT. We will take our chances on that, because once you separate the nitrate proposition from the water-power proposition Mr. Ford will not receive the water-power proposition on those terms.

Mr. MILLER. You mean it will be controlled by the price set by the public utilities commission, the price at which the power is sold in the State of Alabama?

Mr. HAMMITT. I mean the terms are so extremely favorable on the water power to Mr. Ford that somebody else surely will come in and offer something more, and if nobody else will, I think the American Cyanamid Co. will immediately become interested in the water power, because it looks as if that is the best kind of business to go into.

Mr. MILLER. Incidentally, whether you became interested in the water-power proposition or not, you would then be in a position to head off any possible competitor in the business getting hold of that cyanamid plant down there, would you not? That is an accurate statement, is it not?

Mr. HAMMITT. I do not see any way by which we could assist the situation affecting the nitrate plant by negotiations regarding water power. But I will say this, that if you separate the water power from the nitrate plant, with the experience we have had, with the knowledge that we have of the art, and with the processes that we control we will certainly be in at least as good a position, and very likely a better position than anybody else, to undertake the operation of the nitrate plant, and the very minute any operation of that nitrate plant becomes a commercially feasible proposition we will then come to the Government as a matter of business and ask for an opportunity to take it over on terms that will safeguard the Government's interests and provide for its operation.

Mr. MILLER. Here is the situation: In 1916, under the national defense act, there was a fund of \$20,000,000 appropriated by Congress and put into the hands of the President, for the investigation, procurement, etc., of a nitrate plant. That is before we got into the war. We are told that the principal part of that appropriation went into this dam.

Mr. HAMMITT. I think you are correctly informed.

Mr. MILLER. And that the nitrate plants, both No. 1 and No. 2 were constructed out of fortification funds.

Mr. HAMMITT. It was my impression that approximately \$3,000,000 out of the \$20,000,000 appropriated had gone into nitrate plant No. 1, but perhaps I am mistaken about that.

Mr. MILLER. You see by that that none of the \$20,000,000 appropriated for the construction of the nitrate plants under the national defense act of June 3, 1916, ever went into the nitrate plants in the war. It was diverted.

Mr. HAMMITT. As a matter of fact, Congressman, if it went into that dam it was practically all spent after the war was over.

Mr. MILLER. I do not know about that; it probably was.

Mr. HAMMITT. There is no doubt about that.

Mr. MILLER. Now, we get another appropriation from the outside to build the nitrate plant, which we intended to build out of the \$20,000,000 fund.

Mr. HAMMITT. I am not sure that the latter statement is correct, because the \$20,000,000 fund was appropriated for water-power development, as well as for development of nitrate plants.

Mr. MILLER. So far as I can see, the only authority Congress ever conferred upon anybody to construct the nitrate plants, and the only fund ever appropriated by Congress to construct a nitrate plant was the fund appropriated under the act of June 3, 1916.

Mr. HAMMITT. The Ordnance Department was of the opinion that there was another fund, and that it was out of another appropriation. I am not prepared to pass upon that.

Mr. MILLER. That was the only money put in there. Now, Mr. Hammitt, what is the obstacle in the way? Getting right down on opposite sides of the table—what is the obstacle in the way of the American Cyanamid Co. making a proposition to the United States Government? You are vice president of the Air Nitrate Corporation, and you have notice now that the United States Government is negotiating for the alienation of this piece of property and having that notice, why do you not submit a proposition to the Secretary of War, or to the Congress of the United States? Keeping in view always that it is a well-known principle of law that what you have knowledge of as a man you have knowledge of as an official, why do you not submit such a proposition?

Mr. HAMMITT. Given a situation in which we are unwilling to make representations to the Congress or the Government or the public which we do not believe to be true; given a situation in which we do not believe it to be true that that nitrate plant can be operated successfully on a commercial basis at the present time; given the fact that we do not yet believe that it is conceivable that the United States Government proposes to enter into business either directly by Government operation of the manufacturing plants or indirectly by extending a subsidy to a private individual to assist him in such operation, I do not think we are in a position to interest the bankers to whom we would go with this matter to prepare such a proposition.

And what would be the first thing they would say to us? They are hard-headed bankers let us assume. What is the first thing they will say to us? They will say any proposition you offer at this time would be merely a case of bidding against yourself. Congress itself can not negotiate. There are too many Congressmen. This talk of the United States being in negotiation at the present time does not interest a banker, because he knows that Congress is not organized to conduct negotiations, and until Congress has placed the thing in the hands of an administrative officer who can effectually negotiate, I tell you it is a pretty difficult thing to interest hard-headed financiers in the financing of any kind of a proposition. I do not think the Government ought to put itself in the position where it is as difficult as possible to have anybody to bring a proposition to the Government for its consideration, where there is nobody except a man in the peculiarly fortunate position Mr. Ford is in, who can bring a proposition to the Government, thus excluding all possible competition. At the present time, I am quite sure it would not be a practicable thing. I would not be prepared to recommend it to the board of directors of the American Cyanamid Co., that is, to endeavor to prepare and to submit a proposition.

Mr. MILLER. This thought occurs to me, Mr. Hammitt, that if Mr. Ford can negotiate directly through the channels which you seem to think objectionable, and he is negotiating directly with Congress, having put up a proposition that we may accept if we desire to; and that being true, I will ask you why you can not do the same thing? Why have you not the same opportunity to figure as Mr. Ford has?

Mr. HAMMITT. Because the problem is a problem of financing, and Mr. Ford is in a far better position than my company is.

Mr. MILLER. That is exactly what I thought your answer would be. In other words, Mr. Ford can make a more advantageous proposition than you can, and that is the reason you do not make a proposition.

Mr. HAMMITT. No.

Mr. MILLER. Was that not what you said?

Mr. HAMMITT. No. I believe Mr. Ford can make a proposition in this way, with the existing state of the law, when it is entirely possible we can not make any at all, and yet, if you will eliminate the inequalities between a corporation with from \$12,000,000 to \$16,000,000 of assets, and an individual with a bank account under his control of \$150,000,000—if you will equalize that situation—by making it possible for us to negotiate on the basis on which the small fellow can do some financing, then maybe you will have some competition; if you provide that this thing shall be handled on a basis on which a small fellow can not do any financing then you will not get any competition or help from the small fellow. You will find him forced to rely upon the provisions of his contract with the United States.

Mr. MILLER. I had thought, frankly, that this was in the interest of the American Cyanamid Co., because if Mr. Ford takes it over, and provided that your contract is not ultra vires, then Mr. Ford will pay you a million dollars a year on royalties, which will amount to the entire amount of your capital stock in 12 years, and he will pay you, also, \$560,000 a year for an operating fee, and from those two sources alone, what Mr. Ford will have to pay you, will eliminate your entire stock within a comparatively short time.

Mr. HAMMITT. No; this time your figures are wrong.

Mr. MILLER. Do you mean to tell me that you will not get approximately \$1,000,000 a year in royalties?

Mr. HAMMITT. I am not speaking of royalties; I am speaking of operating fees. You will have to leave that out, because that, even under the terms of the contract, would not come to us.

Mr. MILLER. Then, leave that out, still you would have a million dollars a year which he would pay you in royalties, which would be sufficient to retire your entire capital stock within 12 years.

Mr. HAMMITT. Do you believe that Mr. Ford, under the provisions of this contract, would operate this nitrate plant to capacity, and have you had—

Mr. MILLER (interposing). He agrees to do it, to operate it to the capacity of 110,000 tons of ammonium nitrate.

Mr. HAMMITT. I do not read the contract in that way.

Mr. MILLER. Have you the Ford contract before you?

Mr. HAMMITT. No, sir.

Mr. MILLER. Have you looked at it very carefully?

Mr. HAMMITT. I have read it carefully; yes, sir.

Mr. MILLER. Section 14 provides:

"The company agrees to operate Nitrate Plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control."

Now, suppose Mr. Ford's proposition is accepted. Then, for 100 years, the American Cyanamid Co. has an income of \$1,000,000, or as long as your patents exist.

Mr. HAMMITT. Congressman, do not put that in the record in that way, because it is not the fact; it is not a correct interpretation of that provision of the contract. I honestly do not believe, if you will let me help you with that interpretation, that you will believe that is the proper interpretation of the contract. You have had representatives of Mr. Ford here before you, and they have told you Mr. Ford will not make fertilizer materials at Muscle Shoals, unless he can make them at a profit. Mr. Ford stated the same thing to the Secretary of War, and the Secretary of War testified before you to that effect. And I believe, actually, that if operations were continued at Muscle Shoals, producing sulphate of ammonia, at a cost of \$70 a ton to produce that which was continuously sold at \$50 a ton, it would probably result in a proceeding before the Federal Trade Commission to order that stopped as unfair competition.

Mr. MILLER. We will not speculate on those things.

Mr. HAMMITT. Then you have in there your provision for strikes and accidents, and you are proceeding on the theory that you are going to get something

for the 100 years, but no man would continue that kind of an operation at a regular annual loss.

In addition to that do you know that there is a common understanding in business that Mr. Ford does not pay royalties until those who claim the royalties have dragged their weary way along with his attorneys supported by his bank account up to the highest courts, and if you want any information on that subject I suggest that you consult the records of litigation relating to matters of that kind.

Mr. MILLER. I glean from your answer that you are afraid that your royalties would not stick on this contract.

Mr. HAMMITT. No; we believe that if we have the same experience that others have had with perfectly valid claims that we may have to go through expensive litigation before we collect. You have spoken of a period of 100 years, and the principal patents we have expire in 1932, and if he waited for water power to operate that plant it would be several years before he could get started there, and there would only be six years instead of a hundred years during which the royalties could be paid, and that is assuming a capacity operation, which, frankly, I do not believe would result from this contract, and I really doubt if you believe it.

Mr. MILLER. Are you stating the matter correctly? Have you undertaken to bind the United States in this contract to pay for royalties on your patents that will expire in 1932?

Mr. HAMMITT. Not after the patents expire.

Mr. MILLER. Where is there anything in your contract that says after the patents expire the royalties will cease? As I read the contract you have permanently bound the United States to pay you a million dollars a year royalties as long as this contract is in existence, and you tell me now that the patents will expire in 1932.

Mr. HAMMITT. I have been advised by the attorneys of the American Cyanamid Co., and it has always been our understanding, and has been our testimony before various congressional committees, that no royalties would continue after the expiration of those patents.

Mr. MILLER. According to that statement your principal patents will expire in 10 years. If the contract should remain in force for 12 years, then the income from the royalties alone would retire your entire capital stock, and added to that your operating fee, together with the income from the royalties, would retire your entire capital stock in a far less period than 10 years.

Mr. HAMMITT. Of course there is no operating fee except in case of operation by the Air Nitrate Corporation as an agent of the Government.

Mr. MILLER. This contract is in perpetuity.

Mr. HAMMITT. If the Government sells the plant, then the Air Nitrate Corporation does not operate it and does not receive any operating fees. That is our understanding of the contract. Let us cut that out.

Mr. MILLER. Then, you have a million dollars left.

Mr. HAMMITT. That leaves us dependent upon royalties, and our claims for royalties under our patents under this contract and under the license Mr. Ford would receive, as the basis for our compensation against losses due to his being enabled to carry on subsidized competition against us. I state to you frankly that we do not consider that as adequate protection, and that is the reason we are pleading for the protection that we understand is contained in the terms of the contract. It is a matter of business judgment whether it is adequate protection or not, and it is our business judgment that it is not.

Mr. MILLER. I hear your explanation. Is there anything else you have in your mind—any other objection to Mr. Ford's taking this plant over—if this offer is accepted. In other words, have you anything in your mind that you have not suggested to me or some other member of the committee?

Mr. HAMMITT. I have not; no, sir.

Mr. MILLER. I understand your statement perfectly clearly. I understand also that if this contract of Mr. Ford should be accepted by Congress and he should run that plant to its full capacity, and your patents are worth anything, and your contract is worth anything, in 10 years you will have received back in royalties \$10,000,000 of your \$12,220,000 capitalization out of that fund alone. There is the situation for you. If you could get out in the next 10 years ten millions in royalties alone, without touching a hand to it, it seems to me a pretty good proposition for the American Cyanamid Co., which, as you say, has failed to pay dividends. Here is a fund of a million dollars coming in to your company annually. That is what I am driving at.

Mr. HAMMITT. Yes; and I am saying, Congressman, that as a matter of business judgment, taking into consideration all of the elements that have been suggested, we do not think that is satisfactory protection.

Mr. MILLER. Then, there must be some other angle, something else, Mr. Hammitt, that would put your company against the acceptance of such a proposition as that, because you would be getting 10 per cent on the whole capital stock of your company every year.

Mr. HAMMITT. I assure you that I can not furnish you any further light on that subject.

Mr. PARKER. Mr. Hammitt, on page 23 and the following pages of that contract there is a license agreement for the use of the patents, which agreement was made between the American Cyanamid Co. and the United States. Could this plant be operated at all without that license during the life of the lease?

Mr. HAMMITT. It could not.

Mr. PARKER. I see, on page 24, that the first license given by this company is before and during the time the United States shall remain in the present war, and in any event until June 1, 1921. And on page 27, article 6, it is for the first 91,700,000 pounds of nitrogen, and an amount equivalent to 6 mills per pound. How many pounds of nitrogen are there in 110,000 tons of ammonium nitrate?

Mr. HAMMITT. Approximately 42,000 tons; that is, short tons, 2,000 pounds to the ton.

Mr. PARKER. How many pounds is that?

Mr. HAMMITT. Eighty-four million pounds.

Mr. PARKER. How many pounds of nitrogen are there in a ton of nitrate?

Mr. HAMMITT. Eight hundred and forty pounds.

Mr. PARKER. At 6 mills a pound, how much is a ton?

Mr. HAMMITT. That is \$5.04.

Mr. PARKER. That is a pretty fair tax on the price of the stuff; it is one-tenth on it, is it not? It costs \$50 a ton?

Mr. HAMMITT. This ammonium nitrate you are speaking of, Congressman, is not the \$50 a ton material. I do not know what it is selling for now; but it sold for about \$350 a ton during the war.

Mr. PARKER. I pass now to what happened after the war, and I want to ask you about article 10, page 9, which provides that at the expiration of the war the charge shall be 1½ cents per pound unless changed by arbitration.

Mr. HAMMITT. Yes, sir.

Mr. PARKER. How much is that per ton?

Mr. HAMMITT. That is \$12.60.

Mr. PARKER. How much would that be on 110,000 tons?

Mr. HAMMITT. As I have stated in my previous testimony, it amounts to somewhere around a million dollars.

Mr. PARKER. Suppose you multiply \$12.60 by 110,000; what then will you get?

Mr. HAMMITT. That would be \$1,386,000.

Mr. PARKER. At the old rate it would not be as high as Mr. Miller stated. I think it will probably be 110,000 times \$5.04, which will make about \$550,000 a year. I see by the provision on page 31 that the American Cyanamid Co. obviously intended and expected that the United States would sell to others, because it provides that "the license fee"—that is, the United States—"may transfer to the purchaser of any one or more of said plants the right to avail itself of the license in this article granted in the operation of the plants so purchased, if said purchaser, as a term of said purchase, expressly covenant to undertake, observe, perform all the terms of this article, including the payment of royalties and findings of the said undertakers, if any, after expressly * * * plant or plants so purchased."

Mr. HAMMITT. Without that provision there would be no value in the provision authorizing the United States to sell the plant.

Mr. PARKER. That is very true; but this is a provision for purchase.

Mr. HAMMITT. Yes, sir.

Mr. PARKER. And construes the other somewhat. Now, I desire to know, returning to the contract itself, whether under the terms of that contract it is or is not true that the United States is bound to pay the operating expenses of a quarter of a cent a pound whether it applies to the agent or not. The contract provides that the agent agrees to operate until June, 1921, or as long as the United States remains in the present war. On page 12, in the paragraph providing for the operation fee it provides "one-quarter of a cent per pound of ammonium nitrate produced in compliance with article 7 hereof." That is \$5 a ton, is it not?

Mr. HAMMITT. Yes, sir.

Mr. PARKER. "And accepted or utilized by the United States, up to and including 110,000 tons produced in any fiscal year." That would be \$550,000 a year. Now, on page 15, article 17, there is a provision for the termination of the agreement as to any plants, and the United States is to pay for any material on hand, etc.; and also, on page 15, it is provided that if the contract is terminated as to any plant during or prior to the operation thereof by the agent "then the agent shall be paid the sum of money, if any, then due on account of the production of ammonium nitrate in said plants, and the United States shall thereafter continue to pay during the period set forth in article 4"—that is, until the termination of the war, or 1921—"a quarter of a cent per pound." So that this provides for paying the agent whether it operates the plant or not; is that not true?

Mr. HAMMITT. I think that is limited to the period of the war, which has already expired.

Mr. PARKER. During that period, anyway, the United States was to pay that whether it was operated by the agent or not?

Mr. HAMMITT. I think so; yes, sir.

Mr. PARKER. I find in article 18, on page 16, the provision that "nothing in this contract contained shall be deemed to prevent the United States from at any time discontinuing the construction or operation of any or all of said plants, and in the event of such discontinuance the United States shall be under no liability to the agent for any payments as respects such plant or plants beyond those in this agreement specified. In the event that construction or operation is resumed at any of said plants at which construction or operation has been discontinued the provisions of this contract shall govern the rights and obligations of the parties with respect to any such plant to the same effect as though the construction or operation thereof had not been discontinued." Does that apply? Suppose the United States began to operate the plant after the war; would they have to pay operating expenses to the company?

Mr. HAMMITT. Judge Parker, I would like to make the same explanation I made to the chairman in regard to questions that involved the interpretation of the contract. I want the committee to understand I am not a lawyer and do not profess to be able to answer legal questions.

Mr. PARKER. Representing the company, do you say that if the United States was to operate that plant they would have to pay the operating expenses amounting to a quarter of a cent a pound, or \$5 a ton?

Mr. HAMMITT. It is my understanding that that operating fee would have to be paid to the Air Nitrates Corporation only as long as it operated the plant.

Mr. PARKER. Now, after the war is over?

Mr. HAMMITT. Yes, sir.

Mr. PARKER. It would, if it had to be operated during the war.

Mr. HAMMITT. It would seem to me that would be the interpretation of the contract.

Mr. PARKER. It was to be paid during the war. But this is not limited to the war. It says, "In the event that construction or operation is resumed at any of the said plants at which construction or operation has been discontinued, the provisions of this contract shall govern the rights and obligations of the parties." I want to be sure you do not claim one-quarter of a cent per pound if the United States should try to operate that.

Mr. HAMMITT. Judge Parker, I am perfectly willing to accept your interpretation of the provisions of the contract, but my understanding is—

Mr. PARKER (interposing). I want to know what your understanding is.

Mr. HAMMITT. My understanding is that there will be no fee for operating of the plant unless the Air Nitrate Corporation operates the plant. That was my understanding as a layman, but just how it is worked out from the provisions of this contract, I would very much prefer that lawyers would pass upon that question.

Mr. PARKER. At the time this contract was made there was a statute appropriating \$20,000,000 for plants at Muscle Shoals to produce fixed nitrates for fertilizers or explosives, which plant should be operated solely by the United States, and every provision of this contract, whether money was spent under that statute or not, is entirely in agreement with the statute for the plant is to be operated by the United States through its agents. That is true, is it not?

Mr. HAMMITT. I should say it were true, except possibly for those provisions relating to the sale of the plants.

Mr. PARKER. I am speaking of the provisions for the construction and operation; they are entirely in accordance with, and it seems as if they had been drawn under that statute.

Mr. HAMMITT. I think there is no doubt about that.

Mr. PARKER. That they are in agreement with that statute?

Mr. HAMMITT. Yes, sir.

Mr. PARKER. And your suggestion, I think, is that that statute made no provision for the sale of any of those plants, and you desire to guard against a sale which may be made or suggested by the United States under some other statute or some other power. You want to guard against a sale not provided for by that statute?

Mr. HAMMITT. Yes, sir.

Mr. PARKER. Did you not get notice last July of Mr. Ford's proffer?

Mr. HAMMITT. The only notice we have received of Mr. Ford's offer is the same everybody else has received, namely—

Mr. PARKER (interposing). That was published in the newspaper, was it not?

Mr. HAMMITT. Well, not as early as last July, because that proposition was discussed for months before the details of it were published, but it was published in the newspapers ultimately.

Mr. PARKER. If you had been a private individual and not the United States, and had owned a nitrate plant that required an enormous amount of power and was also very expensive for that reason, and also had owned a lot of water power adjacent to it, which was very cheap, would you not as a business proposition, consider that it was sensible to try to dispose of them together?

Mr. HAMMITT. No, sir; I think I would not.

Mr. PARKER. If you were a private individual who owned power and a plant which could not be made of any value except with that power, would you not think that a good business proposition to try to dispose of them together?

Mr. HAMMITT. No, sir.

Mr. PARKER. You have already testified that without very cheap power that nitrate plant can not be used in the production of any kind of nitrogen with success, and producing under present market conditions.

Mr. HAMMITT. I would say even with a cheap power, as provided under this contract, it could not be so used.

Mr. PARKER. With the present power it can not be so used?

Mr. HAMMITT. I should say it could not.

Mr. PARKER. That plant produces several things which are used in the market. I do not speak particularly of fertilizer, but it also produces calcium carbide in very large quantities. Is it good calcium carbide?

Mr. HAMMITT. There is no reason why it should not produce good calcium carbide.

Mr. PARKER. Is there a great current demand for good calcium carbide?

Mr. HAMMITT. I think that at the present time the calcium-carbide industry is very largely down in the United States and Canada.

Mr. PARKER. Is there a demand for it?

Mr. HAMMITT. There is a demand for a certain amount of it, of course; but the present state of the industry is one of depression.

Mr. PARKER. I do not care for a general statement. How much calcium carbide is made at this factory during the year?

Mr. HAMMITT. They can produce 175,000 tons.

Mr. PARKER. How much calcium carbide is disposed of in the United States and the world at the present time? I mean how much is disposed of in a year?

Mr. HAMMITT. I can not say; I am not at all familiar with the carbide industry.

Mr. PARKER. Is there more than 175,000 tons?

Mr. HAMMITT. I am not sure that outside of the consumption of carbide for cyanamid it is, although I certainly would not want to testify as a witness on the carbide industry.

Mr. PARKER. How much do you use in making cyanamid in the operation of your plant?

Mr. HAMMITT. In the operation of our plant in Canada making 60,000 tons of cyanamid we would use about 40,000 or 45,000 tons of carbide.

Mr. PARKER. It is used more or less all over the world. Is it made better or cheaper in the United States than anywhere else?

Mr. HAMMITT. I doubt if it is any better product in the United States than in other countries. The quality of the product depends, of course, not only upon

the operation, but upon the raw materials. But it is a question of where the raw materials are available.

Mr. PARKER. The limestone there is exceedingly good, is it not; that is, near Muscle Shoals, it is 98 per cent limestone, or something of that sort?

Mr. HAMMITT. The limestone at the Waco quarry connected with that plant is very good calcium limestone.

Mr. PARKER. And a large quantity of it can be got there?

Mr. HAMMITT. Yes.

Mr. PARKER. And is the coke very great or not?

Mr. HAMMITT. We use a high-grade coke which is available for the Muscle Shoals plant.

Mr. PARKER. And the whole cost of carbide, outside of rather cheap materials, lies in cheap power, does it not?

Mr. HAMMITT. Of course, there are many items, but power is a very important item.

Mr. PARKER. Is it not a chief item, besides the limestone and coke?

Mr. HAMMITT. No; you would use a great deal of labor in the manufacture of carbide, which is an electric-furnace operation, and in the plant at Muscle Shoals I suppose 40 per cent of the labor would be in the carbide-furnace rooms.

Mr. PARKER. Labor down there is cheap, is it not?

Mr. HAMMITT. I doubt if that is true to a very large extent. It depends not upon the price you pay for labor entirely, but upon the class of labor that is available.

Mr. PARKER. You also make ammonia gas there, do you not?

Mr. HAMMITT. That can be made at the Muscle Shoals plant.

Mr. PARKER. That is made in large quantities. If you have 110,000 tons of nitrate there would be a large amount of ammonia gas, would there not?

Mr. HAMMITT. Yes; that would be made in very large quantities.

Mr. PARKER. Ammonia gas is another valuable product for a great many manufactures, is it not?

Mr. HAMMITT. No; ammonia in the form of ammonia gas at the present time is a very cheap product, because when we speak of sulphate of ammonia as the product of by-product coke ovens we commonly speak of it as sulphate of ammonia, but as a matter of fact, all of our ammonia comes as the by-product of coke ovens and gas works, and it is usually reported in terms of an equivalent amount of sulphate ammonia. So ammonia is a cheap product, and very much cheaper of manufacture than it can be produced at Muscle Shoals.

Mr. PARKER. As to the cheapness of the production of ammonium nitrate or of the sulphate or of the carbide, they are all affected very much by the cheapness of power.

Mr. HAMMITT. If they are made by the process for which the Muscle Shoals plant was designed; yes, sir.

Mr. PARKER. Yet you still say—and I wish you would say yes or no—that you do not think it would be good business to dispose of the power and the plant at the same time, if you sold them.

Mr. HAMMITT. I do not think that would be the best way to dispose of them.

Mr. PARKER. I think some months ago you heard that the Government was proposing or asking for proposals for the sale of these properties together; that is, the sale of the nitrate plant and of the power plant, and the lease of the water power for a long term of years, at terms of interest on the cost of the water power, and on terms that the nitrate plant should be maintained and kept in operation for the production of components of fertilizers. You heard of that?

Mr. HAMMITT. No, sir; as a matter of fact, I do not think that was the general invitation the Government extended. I think that particular combination was invented by Mr. Ford.

Mr. PARKER. Were not the terms of the agreement or proposal you saw some months ago made by Mr. Ford?

Mr. HAMMITT. Of Mr. Ford's proposition; yes.

Mr. PARKER. Was not the Government's proposition that the water power should go also with the nitrate plant?

Mr. HAMMITT. Not certainly, until after the receipt of Mr. Ford's proposition.

Mr. PARKER. What did the letter say?

Mr. HAMMITT. The letter referred entirely to the water power, as I remember it.

Mr. PARKER. Referred entirely to water power?

Mr. HAMMITT. As I remember it; yes.

Mr. PARKER. Not to the nitrate plant?

Mr. HAMMITT. I believe it did not.

Mr. PARKER. Have you that letter here?

Mr. HAMMITT. I have not.

The CHAIRMAN. The letter is in the record.

Mr. PARKER. Nevertheless, when you got that letter or heard of Mr. Ford's proposal, and when you found that the War Department was asking for proposals upon the property down there, you never made any proposition whatever?

Mr. HAMMITT. We have made no proposition.

Mr. CROWTHER. Speaking about taxes, Mr. Hammitt, was your firm advised as to the fact that the law of Alabama rendered you free from taxation for a period of 10 years on such projects in the state of Alabama?

Mr. HAMMITT. The Alabama law renders those projects free from taxation for a certain period, I believe.

Mr. CROWTHER. You spoke of the difficulty of collecting royalties. Did you have reference to what I have heard lately of the long difficult course through the courts that one Seiden had in trying to get some royalties from Ford in connection with a gas engine, and that he also had had difficulties with other companies using his patent and they finally paid him?

Mr. HAMMITT. I think that is one experience generally known.

Mr. CROWTHER. Many other companies did pay this man his royalties?

Mr. HAMMITT. Yes.

Mr. CROWTHER. But Ford finally dragged him through the courts until he defeated him?

Mr. HAMMITT. I believe that is the fact, sir.

Mr. CROWTHER. It seems to me that there is a remarkable resemblance, Mr. Hammitt—and I do not know that it is necessary to read them now—between article 19 of your contract, which has been commented upon as giving a mere preferential right to your corporation, and article 17 of Mr. Ford's contract. It looks as though they might possibly have used article 19 in writing article 17 in their offer, but it seems they even strengthened it a little, to their advantage. For instance, article 19 of your contract closes with this clause, "to purchase the same upon as favorable terms as the United States is willing to accept thereof before the United States shall sell the same to any other party."

Article 17—and I claim no originality for this discovery; Mr. Greene spoke of it as being almost a grant in perpetuity, but it seems to me it is still stronger than article 19, because it says, "In order that said company may be supplied with electric power"—and again these words—"and the farmers with fertilizers, after the termination of 100-year leases, should the United States elect not to operate such power plants but determine to lease or dispose of same, the company shall have the preferred right"—as appears here in article 19—"to negotiate with the United States for such lease or purchase and upon such terms as may then be agreed upon. If the said leases are not renewed or the property covered thereby is not sold to said company, its successors, or assigns, any operation or disposal thereof shall not deprive the company, its successors, or assigns of the right to be supplied with electric power at reasonable rates and in amount equal to its needs, but not in excess of the average amount used by it during the previous 10 years."

So that if it be true that during the previous 10 years there was developed an industry large enough to use all of the power there would not be enough to sell to anybody.

Mr. HAMMITT. That would be my interpretation of it.

Mr. CROWTHER. So that there is in section 17 a still stronger preferential clause even than there is in section 19 of your contract. They still maintain the same right under it to have a preferred status as to negotiations, and then if it is sold they still hold that they are to be supplied with the amount of power they have averaged during the previous 10 years of use; and the possibility might arise that they would have used all of the available power, so there would be nothing to sell.

Mr. HAMMITT. I will say if the Congress decides in carrying out the provisions of our contract to offer the Muscle Shoals project to us on the terms on which Mr. Ford proposes to take it, we would give very careful consideration to that provision of the contract.

Mr. CROWTHER. While there has been considerable criticism of article 19 of your contract, it looks to me as though article 17 of the Ford offer is still stronger and gives them a greater hold on the property, because they might develop industries there that would use in the previous 10 years all the power,

so that there would be nothing whatever to sell. Is there any calcium carbide being imported into this country, do you know?
